Other arguments against DDI appeal to Scripture's depiction of God as changing, e.g., in the Flood story. Facing such texts, DDI's friends defuse the appearance of divine change by appeal to doctrines less speculative and theoretical than DDI. Thus Philo argues from God's foreknowledge of the future and constancy of character that God cannot repent or feel regret, as the Flood story suggests. The Incarnation is an especially knotty problem for DDI's Christian friends. In general, these argue that all change it involved occurred in the human nature God the Son assumed rather than in God; God was eternally ready to be incarnate, and eternally had those experiences of the earthly Christ which the Incarnation makes part of his life. Through changes in Mary and the infant she bore, what was eternally in God eventually took place on earth.

Another argument against DDI appeals to God's power. Before Creation, God could assure that no universe ever existed. God has this power now only if he can alter the past. Few think he can. So events seem to change God's power. DDI's defenders reply that any change here is purely extrinsic. God has the power he always has. He has lost a chance to use it, and so we no longer want to *call* his power a power

to prevent a universe. But God is intrinsically as able as ever to do so.

A final objection goes thus: God does change extrinsically. Even full DDI grants this. But whatever changes extrinsically is in time. For different things are true of it at different times, even if the 'real' changes due to which this is so are in other things. And whatever is in time changes intrinsically -- it grows older. So DDI is false. Some would reply by denying that growing older is an intrinsic change. A more controversial response might be to deny even extrinsic change to God. This can be done by holding that God is atemporal. For if God exists at t and at a later t^*, and, at t, P is true of him and, at t^*, P is false of him, he does change extrinsically. He bears different relations to proposition P, at least. If God is atemporal, he exists neither at t nor at t^* -- his existence is not temporally located. If this is so, there are never two times such that different things are true of him at different times. Rather, all that is ever true of him is true of him timelessly. But a thing changes, even extrinsically, only if different things are true of it at different times. Perhaps, then, defending DDI requires commitment to divine timelessness.

Difficulties for *N*-relation Accounts of Natural Laws

N-relation theories of natural laws face difficulties in accounting for some of the very things they were introduced to explain. These difficulties may not be insuperable, but they are serious enough to be worth noting here.

Modality It isn't clear that *N*-relation theorists are any better off than regularity theorists when it comes to explaining the modal features of laws. If it is a contingent matter, as most aver, which first-order properties stand in the *N*-relation, then this relation doesn't link those properties because of what those properties are *like*; it just happens to link some properties in the actual world, and it could link completely different properties in other possible circumstances. On this account light could have had the phenomenal properties of molasses, photons the mass of the solar system, and two quite different kinds of elementary particles could retain their identities while swapping all their quantum numbers.

The reason why modality is a problem for such *N*-relation theorists is that you cannot infer a genuine nomological *must* from an *is* (although you may be able to contrive some sort of ersatz *must*). If we want genuine modal force to fall out at the end, we have to build it in at the beginning, and on *N*-relation accounts there is no place to put it except in the *N*-relation itself. We might do this by holding that the *N*-relation links the same properties in every nomologically possible world, but without an independent characterization of nomological possibility this doesn't illuminate the nature of laws. So it can be tempting, as a sort of last resort, to conclude that the necessity involved is a very strong, metaphysical necessity. If we do build such a strong necessity into the *N* relation, so that if it actually relates two properties, it necessarily does so, we can explain the modal force of laws. But in accordance with the fundamental ontological tradeoff, investing the *N*-relation with this strong modal force raises the epistemic cost.

Confirmation If laws involve a metaphysical relation holding among properties, it may be more difficult to determine when an observed regularity is actually backed by a law. *N*-relation theorists may urge that we do this using whatever methods actual scientists employ. But argument is required to show that such methods actually give us reasons to believe that there are laws with the strong features that *N*-relation theorists suppose, rather than merely supplying reasons to draw the weaker sorts of conclusions proposed by regularity theorists.

A Nice Sharp Line It is far from clear that there is a sharp line between laws non-laws. Indeed, we often talk as though some laws (e.g., various conservation laws) are very fundamental and robust, while other laws (e.g., Kepler's laws) are less so.

Explanation We often (indeed very often, outside fundamental physics) explain things by citing the causal mechanisms and processes they involve rather than by subsuming them under general laws. For example, we do not explain why all crows are black by saying (in some more idiomatic way) that the *N*-relation holds between the properties *being a crow* and *being black*. We explain it by finding causal (in this case genetic) mechanisms that link the two properties. In other cases we appeal to a deeper theory, e.g., we explain why Kepler's laws hold (to the extent that they do) by deriving (approximations of) them from Newton's laws.

Stanford Encyclopedia of Philosophy
Notes to Properties

Notes

1. Let **I** be an interpretation function with respect to a model, so that **I**(*a*) is the individual **I** assigns to the individual constant '*a*', **I**(F^n) is the *n*-place relation that **I** assigns to *n*-place predicate F^n. Then for all *n*-place predicates 'F^n' and individuals constants 'c_1', ..., 'c_n', the sentence '$F^n c_1 \ldots c_n$' is true in the interpretation just in case < **I**(c_1), ..., **I**(c_n)> ∈ **ext**(**I**(F^n)). We would relativize this clause to variable assignments in the usual way to define satisfaction conditions for atomic sentences.

2. More generally, if φ is a formula with free occurrences of exactly the variables v_1, ..., v_n, then '[λv_1,..., v_n φ]' is an *n*-place complex predicate (normal quotation marks are used here as stand-ins for quasi-quotation). In more complicated applications we could allow φ to contain no free variables (in which case '[λ φ]' denotes the proposition *that*-φ) or more free variables than are bound by the λ-operator (to allow expressions like '[λ*x Fxyz*]', which we could quantify into, as with '∃*y*([λ*x Fxyz*])'.

3. A standard sort of comprehension schema holds that for each open formula φ, $\exists X^n \forall x_1 \ldots \forall x_n (X^n x_1 \ldots x_n$ if and only if φ).

Vagueness

There is wide agreement that a term is vague to the extent that it has borderline cases. This makes the notion of a borderline case crucial in accounts of vagueness. I shall concentrate on an historical characterization of borderline cases that most commentators would accept. Vagueness will then be contrasted with ambiguity and generality. This will clarify the nature of the philosophical challenge posed by vagueness. I will then discuss some rival theories of vagueness with a special emphasis on supervaluationism. I will conclude with the issue of whether all vagueness is linguistic.

1. Inquiry Resistance

If you cut one head off of a two headed man, have you decapitated him? What is the maximum height of a short man? When does a fertilized egg develop into a person?

These questions are impossible to answer because they involve absolute borderline cases. In the vast majority of cases, the unknowability of a borderline statement is only relative to a given means of settling the issue (Sorensen 2001a, chapter 1). For instance, a boy may count as a borderline case of ‘obese’ because people cannot tell whether he is obese just by looking at him. A curious mother could try to settle the matter by calculating her boy's body mass index. The formula is to divide his weight (in kilograms) by the square of his height (in meters). If the value exceeds 30, this test counts him as obese. The calculation will itself leave some borderline cases. The mother could then use a weight-for-height chart. These charts are not entirely decisive because they do not reflect the ratio of fat to muscle, whether the child has large bones, and so on. The boy will only count as an absolute borderline case of ‘obese’ if no possible method of inquiry could settle whether he is obese. When we reach this stage, we start to suspect that our uncertainty is due to the concept of obesity rather than to our limited means of testing for

obesity.

Absolute borderline cases are targeted by Charles Sander Peirce's entry for ‘vague’ in the 1902 *Dictionary of Philosophy and Psychology*:

> A proposition is vague when there are possible states of things concerning which it is *intrinsically uncertain* whether, had they been contemplated by the speaker, he would have regarded them as excluded or allowed by the proposition. By intrinsically uncertain we mean not uncertain in consequence of any ignorance of the interpreter, but because the speaker's habits of language were indeterminate. (Peirce 1902, 748)

In the case of relative borderline cases, the question is clear but our means for answering it are incomplete. In the case of absolute borderline cases, there is incompleteness in the question itself.

When a term is applied to one of its absolute borderline cases the result is a statement that resists all attempts to settle whether it is true or false. No amount of conceptual analysis or empirical inquiry can settle whether removing one head from a two headed man counts as decapitating him. We could give the appearance of settling the matter by stipulating that ‘decapitate’ means ‘remove a head’ (as opposed to ‘make headless’ or ‘remove the head’ or ‘remove the most important head’). But that would amount to changing the topic to an issue that merely sounds the same as decapitation.

Vagueness is standardly defined as the possession of borderline cases. For example, ‘tall’ is vague because a man who is 1.8 meters in height is neither clearly tall nor clearly non-tall. No amount of conceptual analysis or empirical investigation can settle whether a 1.8 meter man is tall. Borderline cases are inquiry resistant. Indeed, the inquiry resistance typically recurses. For in addition to the unclarity of the borderline case, there is normally unclarity as to where the unclarity begins. In other words ‘borderline case’ has borderline cases. This higher order vagueness shows that ‘vague’ is vague.

2. Comparison with Ambiguity and Generality

‘Tall’ is relative. A 1.8 meter pygmy is tall for a pygmy but a 1.8 meter Masai is not tall for a Masai. Although relativization disambiguates, it does not eliminate borderline cases. There are shorter pygmies who are borderline tall for a pygmy and taller Masai who are borderline tall for a Masai. The direct bearers of vagueness are a word's full disambiguations such as ‘tall for an eighteenth century French man’. Words are only vague indirectly, by virtue of having a sense that is vague. In contrast, an ambiguous word has its ambiguity directly -- simply in virtue of having multiple meanings.

This contrast between vagueness and ambiguity is obscured by the fact that most words are both vague and ambiguous. ‘Child’ is ambiguous between ‘offspring’ and ‘immature offspring’. The latter reading of ‘child’ is vague because there are borderline cases of immature offspring. The contrast is further complicated by the fact that most words are also general. For instance, ‘child’ covers both boys and girls.

Mathematical terms such as ‘prime number’ show that a term can be general without being vague. A term can also be vague without being general. Borderline cases of analytically empty predicates illustrate this possibility.

Generality is obviously useful. Often, lessons about a particular *F* can be projected to other *F*s in virtue of their common *F*-ness. When a girl learns that her *cat* has a nictating membrane that protects its eyes, she rightly expects her neighbor's cat also has a nictating membrane. Generality saves labor. When the girl says that she wants a toy rather than clothes, she narrows the range of acceptable gifts without going through the trouble of specifying a particular gift. The girl also balances values: a gift should be intrinsically desired and yet also be a surprise. If uncertain about which channel is the weather channel, she can hedge by describing the channel as ‘forty-something’. There is an inverse relationship between the contentfulness of a proposition and its probability: the more specific a claim, the less likely it is to be true. By gauging generality, we can make sensible trade-offs between truth and detail.

‘Vague’ has a sense which is synonymous with abnormal generality. This precipitates many equivocal explanations of vagueness. For instance, many commentators say that vagueness exists because broad categories ease the task of classification. If I can describe your sweater as red, then I do not need to figure out whether it is scarlet. This freedom to use wide intervals obviously helps us to learn, teach, communicate, and remember. But so what? The problem is to explain the existence of borderline cases. Are they present because vagueness serves a function? Or are borderline cases side-effects of ordinary conversation -- like echoes?

Unless special preventive measures are taken the attempt to classify objects will unintentionally leave some unanswerable questions in its wake. Predicates are like multi-stage rockets. Rockets which shed components are not designed to spread space age thingamajigs to inaccessible places. But if no precautions are taken, rockets will sow mysteries. At the extreme end of this accidental continuum lie the analogues of borderline cases.

Every natural language is both vague and ambiguous. However, both features seem eliminable. Indeed, both are eliminated in miniature languages such as checkers notation, computer programming languages, and mathematical descriptions. Moreover, it seems that both vagueness and ambiguity ought to be minimized. ‘Vague’ and ‘ambiguous’ are pejorative terms. And they deserve their bad reputations. Think of all the automotive misery that has been prefaced by

> Driver: Do I turn left?
> Passenger: Right.

English can be lethal. Philosophers have long motivated appeals for an ideal language by pointing out how ambiguity creates the menace of equivocation:

> No child should work.
> Every person is a child of someone.

> Therefore, no one should work.

Happily, we know how to criticize and correct all equivocations. Indeed, every natural language is self-disambiguating in the sense that each has all the resources needed to uniquely specify any reading one desires. Ambiguity is often the cause but rarely the object of philosophical rumination.

3. The Philosophical Challenge Posed by Vagueness

Vagueness, in contrast, precipitates a profound problem: the sorites paradox. For instance,

> Base step: A one day year old human being is a child.
>
> Induction step: If an *n* day old human being is a child, then that human being is also a child when it is *n* + 1 days old.
>
> Conclusion: Therefore, a 36,500 day old human being is a child.

The conclusion is false because a 100 year old man is clearly a non-child. Since the base step of the argument is also plainly true and the argument is valid by mathematical induction, we seem to have no choice but to reject the second premise.

George Boolos (1991) observes that we have an autonomous case against the induction step. In addition to implying plausible conditionals such as ‘If a 1 day old human being is a child, then that human being is also a child when it is 2 days old’, the induction step also implies ludicrous conditionals such as ‘If a 1 day old human being is a child, then that human being is also a child when it is 36,500 days old’. For some reason, we tend to overlook these easy counterexamples to the induction step.

With Boolos' helping hand, we have driven *two* stakes into the heart of the sorities paradox. Yet the paradox seems far from dead. The negation of the second premise classically implies a sharp threshold for childhood. For it implies the existential generalization that there is a number *n* such that an n day old human being is a child but is no longer a child *n* + 1 days.

Epistemicists accept this astonishing consequence. They think vagueness is a form of ignorance. Timothy Williamson (1994) traces the ignorance of the threshold for childhood to "margin for error" principles. If one knows that an *n* day old human being is a child, then that human being must also be a child when *n* + 1 days old. Otherwise, one is right by luck.

Most philosophers believe that epistemicism is tantamount to the acceptance of a linguistic miracle. They boggle at the possibility that our rough and ready terms such as ‘child’ could so sensitively classify

objects. Epistemicists counter that this bafflement rests on an over-estimate of the role of stipulation in meaning. They say much meaning is acquired passively by default rather than actively by decision.

Still, most philosophers blame logic rather than our beliefs about language. Surprisingly, H. G. Wells was amongst the first to suggest that we must moderate the *application* of logic:

> Every species is vague, every term goes cloudy at its edges, and so in my way of thinking, relentless logic is only another name for stupidity -- for a sort of intellectual pigheadedness. If you push a philosophical or metaphysical enquiry through a series of valid syllogisms -- never committing any generally recognized fallacy -- you nevertheless leave behind you at each step a certain rubbing and marginal loss of objective truth and you get deflections that are difficult to trace, at each phase in the process. Every species waggles about in its definition, every tool is a little loose in its handle, every scale has its individual. -- *First and Last Things* (1908)

Many more believe that problem is with logic itself rather than the manner in which it is applied. They favor solving the sorites paradox by replacing standard logic with an earthier deviant logic.

There is a desperately wide range of opinions as to how the revision of logic should be executed. Every form of deviant logic has been applied in the hope of resolving the sorites paradox.

An early favorite was many-valued logic. On this approach, borderline statements are assigned truth-values that lie between full truth and full falsehood. New rules are introduced to calculate the truth value of compound statements that contain statements with intermediate truth-values. For instance, the revised rule for conjunctions is to assign the conjunction the same truth-value as the conjunct with the lowest truth-value.

Most theorems of standard logic break down when intermediate truth-values are involved. (An irrelgular minority, such as $P \rightarrow P$, survive.) Even the classical contradiction ‘Bozo is bald and it is not the case that he is bald’ receives a truth-value of .5 when ‘Bozo is bald’ has a truth-value of .5. Many-valued logicians note that the error they are imputing to classical logic is often so small that classical logic can still be fruitfully applied. But they insist that the sorites paradox illustrates how tiny errors can accumulate into a big error.

Critics of the many-valued approach complain that it botches phenomena such as hedging. If I regard you as a borderline case of ‘tall man’, I cannot sincerely assert that you are tall and I cannot sincerely assert that you are of average height. But I can assert the hedged claim ‘You are tall or of average height’. The many-valued rule for disjunction is to assign the whole statement the truth-value of its highest disjunct. Normally, the added disjunct in a hedged claim is not more plausible than the other disjuncts. Thus it cannot increase the degree of truth. Disappointingly, the proponent of many-valued logic cannot trace the increase of assertibility to an increase the degree of truth.

Epistemicists explain the rise in assertibility by the increasing probability of truth. Since the addition of disjuncts can raise probability indefinitely, the epistemicists correctly predict that we can hedge our way to full assertibility. However, epistemicists does not have a monopoly on this prediction.

4. Supervaluationism

According to supervaluationists, borderline statements lack a truth-value. This neatly explains why it is universally impossible to know the truth-value of a borderline statement. Supervaluationism offers details about the nature of absolute borderline cases. Simple sentences about borderline cases lack a truth-value. Compounds of these statements can have a truth-value if they come out true regardless of how the statement is precisified. For instance, ‘Either Mr. Stoop is tall or it is not the case that Mr. Stoop is tall’ is true because it comes out true under all ways of sharpening ‘tall’. Thus the method of supervaluations allows one to retain all the theorems of standard logic while admitting "truth-value gaps".

One may wonder whether this striking result is a genuine convergence with standard logic. Is the supervaluationist characterizing vague statements as propositions? Or is he merely pointing out that certain non-propositions have a structure isomorphic to logical theorems? (Some electrical circuits are isomorphic to tautologies but this does make the circuits tautologies.) Kit Fine (1975, 282), and especially David Lewis, characterize vagueness as hyper-ambiguity. Instead of there being one vague concept, there are many precise concepts that closely resemble each other. ‘Child’ can mean a human being at most one day old or mean a human being at most two days old or mean a human being at most three days old . . . Thus the logic of vagueness is a logic for equivocators. Lewis' idea is that ambiguous statements are true when they come out true under all disambiguations. But logicians normally require that a statement be disambiguated *before* logic is applied. The laws of logic are about *propositions*. The mere fact that an ambiguous statement comes out true under all its disambiguations does not show that the statement itself is true. Sentences which are *actually* disambiguated may have truth-values. But the best that can be said of those that merely *could* be disambiguated is that they *would* have had a truth-value had they been disambiguated (Tye 1989).

Supervaluationism will converge with classical logic only if each word of the supervaluated sentence is uniformly interpreted. For instance, ‘Either a carbon copy of Teddy Roosevelt's signature is an autograph or it is not the case that a carbon copy of Teddy Roosevelt's signature is an autograph’ comes out true only if ‘autograph’ is interpreted the same way in both disjuncts. Vague sentences resist mixed interpretations. However, mixed interpretations are permissible for ambiguous sentences. As Lewis himself notes in a criticism of relevance logic, ‘Scrooge walked along the bank on his way to the bank’ can receive a mixed disambiguation. When exterminators offer ‘non-toxic ant poison’, we charitably relativize: the substance is safe for human beings but deadly for ants.

Even if one agrees that supervaluationism converges with classical logic about theoremhood, they clearly differ in other respects. Supervaluationism requires rejection of inference rules such as contraposition, conditional proof and reductio ad absurdum (Williamson 1994, 151-152). In the eyes of the supervaluationist, a demonstration that a statement is not true does not guarantee that the statement is

false.

The supervaluationist is also under pressure to reject semantic principles which are intimately associated with the application of logical laws. According to Alfred Tarski's Convention T, a statement ‘*S*’ is true if and only if *S*. In other words, truth is disquotational. Supervaluationists say that being supertrue (being true under all precisifications) suffices for being true. But given Convention T, supertruth would then be disquotational. Since the supervaluationists accept the principle of excluded middle, they would be forced to say ‘*P*’ is supertrue or ‘Not *P*’ is supertrue (even if ‘*P*’ applies a predicate to a borderline case). This would imply that either ‘*P*’ is true or ‘Not *P*’ is true. (Williamson 1994, 162-163) And that would be a fatal loss of truth-value gaps for supervaluationism.

There is a final concern about the "ontological honesty" of the supervaluationist's existential quantifier. As part of his solution to the sorites paradox, the supervaluationist will assert ‘There is a human being who was a child when *n* days old but not when *n* + 1 days old’. For this statement comes out true under all admissible precisifications of ‘child’. However, when pressed the supervaluationist will add an unofficial clarification: "Oh, of course I do not mean that there really is a sharp threshold for childhood."

After the clarification, some wonder how supervaluationism differs from drastic metaphysical skepticism. In his nihilist days, Peter Unger (1979) admitted that it is useful to talk *as if* there are children. But he insisted that strictly speaking, vague terms such as ‘child’ cannot apply to anything. Unger was free to use supervaluationism as a theory to explain our ordinary discourse about children. (Unger instead used other resources to explain how we fruitfully apply empty predicates.) But once the dust had cleared and the precise rubble came into focus, Unger had to conclude that there are no children.

Officially, the supervaluationist rejects the induction step of the sorites argument. Unofficially, he seems to instead reject the *base* step of the sorites argument.

5. Is All Vagueness Linguistic?

Supervaluationism encourages the view that all vagueness is a matter of linguistic indecision: the reason why there are borderline cases is that we have not bothered to make up our minds. Many supervaluationists maintain that this indecision is functional. Instead of committing ourselves prematurely, we can fill in meanings as we go along in light of new information and interests. This conjecture is promising for the highly stipulative enterprise of promulgating and enforcing laws (Endicott 2000). Judges frequently seem to exercise and control discretion by means of vague language. However, there is the suspicion that the real work is being done by the generality of the legal propositions rather than their vagueness (Sorensen 2001b).

Objects themselves do not seem to be the sort of thing that can be general, ambiguous, or vague. Thus the Romantics appear to be committing a category mistake when they characterize sea foam as vague. Indeed, there used to be a consensus that believers in vague objects were committing the fallacy of verbalism -- inferring that an object has the property that its representation has.

A minority of philosophers now believe that there are vague objects (clouds, the sky, perhaps even entities of quantum physics). There is a precedent for this revival. Peter van Inwagen recalls that thirty years ago, there was a consensus that all necessity is linguistic. Most philosophers now take the possibility of essential properties seriously.

Indeed, some allege that supervaluationists inadvertently rely on metaphysical vagueness to characterize linguistic vagueness (Merricks 2001). If ‘Bozo is bald’ lacks a truth-value because there is no fact to make the statement true, then the shortage appears to be ontological rather than linguistic.

The view that vagueness is always linguistic has been attacked from other directions. Mental imagery seems vague. When rising suddenly after a prolonged crouch, I "see stars before my eyes". I can tell there are more than ten of these hallucinated lights but I cannot tell how many. Is this indeterminacy in thought to be reduced to indeterminacy in language? Why not vice versa? Language is an outgrowth of human psychology. Thus it seems natural to view language as merely an accessible intermediate bearer of vagueness.

Sorites Paradox

The sorites paradox is the name given to a class of paradoxical arguments, also known as little-by-little arguments, which arise as a result of the indeterminacy surrounding limits of application of the predicates involved. For example the concept of a heap appears to lack sharp boundaries and, as a consequence of the subsequent indeterminacy surrounding the extension of the predicate 'is a heap', no one grain of wheat can be identified as making the difference between being a heap and not being a heap. Given then that one grain of wheat does not make a heap, it would seem to follow that two do not, thus three do not, and so on. In the end it would appear that no amount of wheat can make a heap. We are faced with paradox since from apparently true premises by seemingly uncontroversial reasoning we arrive at an apparently false conclusion.

This phenomenon at the heart of the paradoxes is now recognised as the phenomenon of vagueness. Once identified, vagueness can be seen to be a feature of syntactic categories other than predicates, nonetheless one speaks primarily of the soriticality of predicates. Names, adjectives, adverbs and so on are only susceptible to paradoxical sorites reasoning in a derivative sense.

Sorites arguments of the paradoxical form are to be distinguished from multi-premise syllogisms (polysyllogisms) which are sometimes also referred to as sorites arguments. Whilst both polysyllogisms and sorites paradoxes are chain-arguments, the former need not be paradoxical in nature and the latter need not be syllogistic in form.

The Sorites In History

The name 'sorites' derives from the Greek word *soros* (meaning 'heap') and originally referred, not to a

paradox, but rather to a puzzle known as *The Heap*: Would you describe a single grain of wheat as a heap? No. Would you describe two grains of wheat as a heap? No. ... You must admit the presence of a heap sooner or later, so where do you draw the line?

It was one of a series of puzzles attributed to the Megarian logician Eubulides of Miletus. Also included were:
The Liar: A man says that he is lying. Is what he says true or false?
The Hooded Man: You say that you know your brother. Yet that man who just came in with his head covered is your brother and you did not know him.
The Bald Man: Would you describe a man with one hair on his head as bald? Yes. Would you describe a man with two hairs on his head as bald? Yes. ... You must refrain from describing a man with ten thousand hairs on his head as bald, so where do you draw the line?

This last puzzle, presented as a series of questions about the application of the predicate 'is bald', was originally known as the *falakros* puzzle. It was seen to have the same form as the Heap and all such puzzles became collectively known as sorites puzzles.

It is not known whether Eubulides actually invented the sorites puzzles. Some scholars have attempted to trace its origins back to Zeno of Elea however the evidence seems to point to Eubulides as the first to employ the sorites. Nor is it known just what motives Eubulides may have had for presenting this puzzle. It was, however, employed by later Greek philosophers to attack various positions. Most notably by the Sceptics against the Stoics' claims to knowledge.

These puzzles of antiquity are now more usually described as paradoxes. Though the conundrum can be presented informally as a series of questions whose puzzling nature gives it dialectical force it can be, and was, presented as a formal argument having logical structure. The following argument form of the sorites was common:

> 1 grain of wheat does not make a heap.
> If 1 grain of wheat does not make a heap then 2 grains of wheat do not.
> If 2 grains of wheat do not make a heap then 3 grains do not.
> ...
> If 9,999 grains of wheat do not make a heap then 10,000 do not.
> --
> 10,000 grains of wheat do not make a heap.

The argument certainly seems to be valid, employing only *modus ponens* and *cut* (enabling the chaining together of each sub-argument which results from a single application of *modus ponens*). These rules of inference are endorsed by both Stoic logic and modern classical logic.

Moreover its premises appear true. Some Stoic presentations of the argument recast it in a form which replaced all the conditionals, 'If *A* then *B*', with 'Not(*A* and not-*B*)' to stress that the conditional should

not be thought of as being a strong one, but rather the weak Philonian conditional (the modern material conditional) according to which ‘If *A* then *B*’ was equivalent to ‘Not(*A* and not-*B*)’. Such emphasis was deemed necessary since there was a great deal of debate in Stoic logic regarding the correct analysis for the conditional. In thus judging that a connective as weak as the Philonian conditional underpinned this form of the paradox they were forestalling resolutions of the paradox that denied the truth of the conditionals based on a strong reading of them. This interpretation then presents the argument in its strongest form since the validity of *modus ponens* seems assured whilst the premises are construed so weakly as to be difficult to deny. The difference of one grain would seem to be too small to make any difference in the application of the predicate; it is a difference so negligible as to make no apparent difference in the truth values of the respective antecedents and consequents.

Yet the conclusion seems false. Thus paradox confronted the Stoics just as it does the modern classical logician. Nor are such paradoxes isolated conundrums. Innumerable sorites paradoxes can be expressed in this way. For example, one can present the puzzle of the Bald Man in this manner. Since a man with one hair on his head is bald and if a man with one is then a man with two is, so a man with two hairs on his head is bald. Again, if a man with two is then a man with three is, so a man with three hairs on his head is bald, and so on. So a man with ten thousand hairs on his head is bald yet we rightly feel that such men are hirsute, i.e. not bald. Indeed, it seems that almost any vague predicate admits of such a sorites paradox and vague predicates are ubiquitous.

As presented, the paradox of the Heap and the Bald Man proceed by addition (of grains of wheat and hairs on the head respectively). Alternatively though, one might proceed in reverse, by subtraction. If one is prepared to admit that ten thousand grains of sand do make a heap then would can argue that one grain of sand does since the removal of any one grain of sand cannot make the difference. Similarly, if one is prepared to admit a man with ten thousand hairs on his head is not bald, then one could prove that even with one hair on his head he is not bald since the removal of any one hair from the originally hirsute scalp cannot make the relevant difference. It was thus recognised even in antiquity that sorites arguments come in pairs: non-heap and heap; bald and hirsute; poor and rich; few and many; small and large; and so on. For every argument which proceeds by addition there is another reverse argument which proceeds by subtraction.

The paradox attracted little subsequent interest until the late nineteenth century when formal logic once again assumed a central role in philosophy. With the demise of ideal language doctrines in the latter half of the twentieth century interest in the vagaries of natural language and the sorites paradox in particular has greatly increased.

Its Paradoxical Forms

The common form of the sorites paradox presented for discussion in the literature is the form discussed above. Let ‘*F*’ represent the soritical predicate (e.g. ‘is bald’, or ‘does not make a heap’) and let the expression ‘a_i’ (where *i* is a natural number) represent a subject expression in the series with regard to which ‘*F*’ is soritical (e.g., ‘a man with *i* hair(s) on his head’ or ‘*i* grain(s) of wheat’, depending on *F*).

Then the sorites proceeds by way of a series of conditionals and can be schematically represented as follows:

Conditional Sorites

Fa_1
If Fa_1 then Fa_2
If Fa_2 then Fa_3
...
If Fa_{i-1} then Fa_i

Fa_i (where i can be arbitrarily large)

Whether the argument is taken to proceed by addition or subtraction will depend on how one views the series.

Barnes (1982) states conditions under which any argument of this form is soritical. Initially, the series $\langle a_1, ..., a_i \rangle$ must be ordered; for example, scalps ordered according to number of hairs, heaps ordered according to number of grains of wheat, and so on. Secondly, the predicate ‘*F*’ must satisfy the following three constraints: (i) it must appear true of a_1, the first item in the series; (ii) it must appear false of a_i, the last item in the series; and (iii) each adjacent pair in the series, a_n and a_{n+1}, must be sufficiently similar as to appear indiscriminable in respect of ‘*F*’ -- that is, both a_n and a_{n+1} appear to satisfy ‘*F*’ or neither do. Under these conditions ‘*F*’ will be soritical relative to the series $\langle a_1, ..., a_i \rangle$ and any argument of the above form using ‘*F*’ and $\langle a_1, ..., a_i \rangle$ will be soritical.

In recent times the explanation of the fact that sorites arguments come in pairs has shifted from consideration of the sorites series itself to the predicate involved. It is now common to focus on the presence or absence of a negation in the predicate, noting the existence of both a positive form which bloats the predicate's extension and negative form which shrinks the predicate's extension. With the foregoing analysis of the conditions for sorites susceptibility it is easy to verify that ‘*F*’ will be soritical relative to $\langle a_1, ..., a_i \rangle$ if and only if ‘not-*F*’ is soritical relative to $\langle a_i, ..., a_1 \rangle$. Thus verifying that for every positive sorites there is an analogous negative variant.

The key feature of soritical predicates which drives the paradoxes, constraint (iii), is described in Wright (1975) as "tolerance" and is thought to arise as a result of the vagueness of the predicate involved. Predicates such as ‘is a heap’ or ‘is bald’ appear tolerant of sufficiently small changes in the relevant respects -- namely number of grains or number of hairs. The degree of change between adjacent members of that series relative to which ‘*F*’ is soritical would seem too small to make any difference to the application of the predicate ‘*F*’. Yet large changes in the relevant respects will make a difference, even though large changes are the accumulation of small ones which don't seem to make a difference.

This is the very heart of the conundrum which has delighted and perplexed so many for so long.

Any resolution of the paradoxes is further complicated by the fact that they can be presented in a variety of forms and the problem they present can only be considered solved when all forms have been defused.

One variant replaces the set of conditional premises with a universally quantified premises. Let '*n*' be a variable ranging over the natural numbers and let '∀*n*(...*n*...)' assert that every number *n* satisfies the condition ...*n*... . Further, let us represent the claim of the form "for all *n*, if Fa_n then Fa_{n+1}" as follows:

$$\forall n(Fa_n \rightarrow Fa_{n+1})$$

Then the sorites is now seen as proceeding by the inference pattern known as mathematical induction:

Mathematical Induction Sorites

Fa_1
$\forall n(Fa_n \rightarrow Fa_{n+1})$

$\forall nFa_n$

So, for example, it is argued that since a man with 1 hair on his head is bald and since the addition of one hair cannot make the difference between being bald and not bald (for any number *n*, if a man with *n* hairs is bald then so is a man with *n*+1 hairs), then no matter what number *n* you choose, a man with *n* hairs on his head is bald.

Yet another form is a variant of this inductive form. Assume that it is not the case that for every *n*, a man with *n* hairs on his head is not bald, i.e., that for some number *n*, it is not the case that a man with *n* hairs on his head is bald. Then by the least number principle (equivalent to the principle of mathematical induction) there must be a least such number, say *i*+1, such that it is not the case that a man with *i*+1 hairs on his head is bald. Since a man with 1 hair on his head is bald it follows that *i*+1 must be greater than 1. So, there must be some number *n* (= *i*) such that a man with *n* hairs counts as bald whilst a man with *n*+1 does not. Thus it is argued that though a_1 is bald, not every number *n* is such that a_n is bald, so there must be some point at which baldness ceases. Let '∃*n*(...*n*...)' assert that some number *n* satisfies the condition ...*n*... . Then we can represent the chain of reasoning just described as follows:

Line-drawing Sorites

Fa_1
$\sim\forall nFa_n$

$$\exists n \geq 1(Fa_n \;\&\; {\sim}Fa_{n+1})$$

Now obviously, given that sorites arguments have been presented in these three forms, "the sorites paradox" will not be solved by merely claiming, say, mathematical induction to be invalid for soritical predicates. All forms need to be addressed one way or another. One would hope to solve it, if at all, by revealing some general underlying fault common to all forms of the paradox. No such general solution could depend on the diagnosis of a fault peculiar to any one form. On the other hand, were no general solution available then "the sorites paradox" will only be solved when each of its forms separately have been rendered toothless. This piecemeal approach holds little attraction though. It is less economical than a unified approach, arguably less elegant, and would fail to come to grips with the underlying unifying phenomenon which is considered to give rise to the paradoxes, namely vagueness. A logic of vagueness, be it classical or otherwise, ought to be able to defuse all those paradoxes that have their source in this phenomenon.

Responses

The various responses to soritical reasoning can be most easily catalogued by focussing on that form most commonly discussed in the literature -- the conditional form. As with any paradox, four responses appear to be available. One might:

> (1) deny that logic applies to soritical expressions.

According to this response the problem cannot legitimately be set up in the first place. On the other hand one might accept that the sorites paradox constitutes a legitimate argument to which logic applies and deny its soundness by:

> (2) denying some premise(s),

or

> (3) denying its validity.

Finally, seemingly as a last resort, one might embrace the paradox and

(4) accept it as sound.

Ideal Language Approaches

Committed as Frege and Russell were to ideal language doctrines, it is not surprising to find them pursuing response (1). A key attribute of the ideal language is its precision; the vagueness of natural language is a defect to be eliminated. Since soritical terms are vague, the elimination of vagueness will entail the elimination of soritical terms. They cannot then, as some theorists propose, be marshalled as a challenge to classical logic.

A modern variation on this response, promoted most notably by Quine, sees vagueness as an eliminable feature of natural language. The class of vague terms, including soritical predicates, can as a matter of fact be dispensed with. There is, perhaps, some cost to ordinary ways of talking, but a cost that is nonetheless worth paying for the simplicity it affords -- namely, our thereby being able to defend classical logic with what Quine describes as its "sweet simplicity".

However, with the demise of ideal language doctrines and subsequent restoration of respect for ordinary language, vagueness is increasingly considered less superficial than response (1) suggests. If logic is to have teeth it must be applicable to natural language as it stands. Soritical expressions are unavoidable and the paradox must be squarely faced.

Responses of type (2) do just this. Logic is seen as applicable to natural language, in particular the sorites paradox, but the conditional form of the argument is seen as proceeding from a faulty premise.

The Epistemic Theory

According to Williamson (1994) Stoic logicians pursued just such a route. Given their acceptance of the principle of bivalence and their presentation of the argument as invoking a material conditional, they blocked the sorites by claiming some one conditional to be false (since not true) and that there comes a point in any sorites series where the relevant predicate ceases to apply and its negation does. For example vague terms like ‘heap’ or ‘knowledge’, though soritical relative to an appropriately chosen series, are semantically determinate so, in spite of appearances to the contrary, there is a sharp cut-off point to their application. The inclination to validate all the premises of a sorites argument (along with the inference pattern employed, which the Stoics accepted) was to be explained via ignorance -- more exactly, the unknowable nature of the relevant sharp semantic boundary.

In this way the threat of wholesale scepticism urged by the Sceptics was met by the limited scepticism arising from our inability to know the precise boundaries to knowledge. "Nothing can be known" was rejected in favour of "The precise boundaries to knowledge itself cannot be known". This epistemological response has been elaborated on in Sorensen (1988) and Williamson (1994). Though soritical predicates are admittedly indeterminate in their extension the indeterminacy is not semantic. The conundrum presented by the sorites paradox is an epistemological one which in no way challenges

classical semantics or logic.

Until recently such a solution was ruled out by definition. Vagueness was characterised as a semantic phenomenon whereby the apparent semantic indeterminacy surrounding a soritical term's extension was considered real. In the absence of any apparent barrier to knowledge of a soritical predicate's precise extension it was assumed that there was simply no precise extension to be known. The philosophical landscape has now changed. Williamson (1994) contains an impressive array of arguments defending an epistemological account of vagueness which, if successful, would make possible an epistemological solution to the sorites.

The key concern with the epistemological approach however is its counter intuitive nature. Even if such an analysis is possible, the indeterminacy surrounding the application of soritical terms is generally considered to be a semantic phenomenon. Once seen in this way, classical semantics appears in need of revision, and with it classical logic. In the second half of this century there have been a number of attempts to develop non-classical logics of vagueness, a major constraint being the provision of a solution to the sorites paradox. The extent of the proposed logical innovation varies.

Supervaluationism

In accord with a principle of least mutilation, Dummett (1975) and Fine (1975) adapt Van Fraassen's supervaluation semantics to the sorites paradox, and vagueness more generally, resulting in a non-bivalent logic which, initially at least, retains the classical consequence relation and classical laws whilst admitting truth value gaps. The challenge posed by the sorites paradox can, on this view, to be met by logical revision in the metatheory alone.

According to the semantic conception of vagueness, a vague predicate is characterised by the existence of border cases; that is, cases to which the predicate neither definitely applies nor definitely doesn't apply. If we define the positive extension as those objects to which the predicate definitely applies, the negative extension as those to which the predicate definitely does not apply, and any remaining border cases as the penumbra, then vague predicates are characterised by their having a penumbra.

Given a vague predicate, for example ‘heap’, we can then stipulate a sharpening thereof, ‘heap*’ which resolves any border cases by placing them either in the positive or negative extension of ‘heap*’. Intuitively, for a sharpening to be admissible as a sharpening of the original vague predicate it ought to also be constrained by its only resolving vague semantic aspects of the predicate's meaning. For example if a pile of *i* grains of wheat definitely counts as a heap then it ought to be definitely counted a heap*; positive cases ought remain unchanged, as should negative cases. Additionally it should not draw a line between positive and negative cases in such a way as to alter definite ordering relations. Since it is definitely the case that *i*+1 grains counts as a heap if *i* does, *i*+1 will count as a heap* if *i* does. An admissible sharpening of any soritical predicate will simply extend the positive and negative extensions to form a sharp boundary somewhere in the predicate's penumbra.

It is easy to see that vague predicates in general have no unique admissible sharpening; there will be a number of possibilities depending on where the cut-off point between the positive and negative extension of the now precise predicate is drawn. Nonetheless, to predicate ‘heap’ of something in the positive extension will be true for all admissible sharpenings of the predicate and to predicate ‘heap’ of something in the negative extension will be false for all admissible sharpenings. Defining "truth" *simpliciter* (or, as it is sometimes called, "supertruth") as "truth on all admissible sharpenings", the former predications will be, quite simply, true and the latter false. To predicate ‘heap’ of a border case will be true on some admissible sharpenings and false on others and so is considered neither true nor false but indeterminate in truth value.

Validity can now be defined so that an argument is supervaluationally valid just in case every model in which the premises are true is one in which the conclusion is also true. Validity thus defined coincides with classical validity, reflecting the fact that the basic underlying notion of ‘truth on an admissible sharpening’ is a classical two-valued valuation function. In particular, treating laws as zero-premise arguments, such supervaluationism preserves all classical laws. In spite of its being non-bivalent then it validates the law of excluded middle. For example, it is true in every model that i grains of wheat either does or does not make a heap since in any model the corresponding disjunction with ‘heap*’ in place of ‘heap’ will be true regardless of which admissible sharpening ‘heap*’ is considered.

Supervaluation semantics then is no longer truth-functional. Consider disjunction for example. Some disjunctions with indeterminate disjuncts will count as indeterminate, for example ‘(Border case) a_{i} makes a heap or it makes a heap’; whereas some will count as true, for example ‘(Border case) a_{i} makes a heap or it does not make a heap’. Moreover the semantics countenances instances of true disjunctions neither of whose disjuncts is true. Conjunction and the conditional exhibit analogous non-classical features.

Since all the forms taken by the sorites are classically valid, they are also supervaluationally valid. The conclusion of the conditional form is resisted by noticing that some conditional premise fails to be true. For example, the premise ‘If (border case) a_i makes a heap then (border case) a_{i+1} makes a heap’ will admit of a sharpening which draws the line between a_i and a_{i+1} thus making the conditional false on that sharpening, and one which does not so draw the line, making the conditional true on that sharpening. It is therefore neither true nor false but indeterminate. The conditional sorites is valid but unsound.

More revealing is the diagnosis with regard to the mathematical induction form. It is also deemed unsound due to the failure of one of the premises -- the universal premise. The universally quantified conditional is not true; in fact it's false. While there is no one conditional premise of the conditional form which is false, it is nonetheless true according to supervaluation theory that some conditional is. That is to say, it is false that for all n, if Fa_n then Fa_{n+1} (where ‘F’ is soritical relative to the subjects of the form a_i). For any sharpening of the vague predicate ‘F’ there will always be some a_i which counts as the cut-off point relative to that sharpening and thus falsifies the relevant conditional ‘if Fa_i then Fa_{i+1}’. Every sharpening produces a cut-off point even though no single cut-off point is produced by every sharpening.

Hence "For all n, if Fa_n then Fa_{n+1}" is false on every sharpening and so false *simpliciter*.

Given that supervaluation semantics admits that the falsity of "For all n, if Fa_n then Fa_{n+1}" is logically equivalent to the truth of "For some n, Fa_n & $\sim Fa_{n+1}$", the line-drawing form of the sorites is also solved. The argument is supervaluationally valid since classically valid and its premises are uncontestably true. What supervaluation semantics provides is an account of how it is that such a conclusion could be true; it is true since true no matter how one admissibly sharpens the soritical predicate involved.

In this way then the sorites paradoxes are said to be defused. Classical logic is no longer appropriate to reasoning in vague contexts and supervaluation semantics is proposed in its place. One immediate concern facing this solution however is the fact that it ultimately treats the mathematical induction and line-drawing forms of the sorites in just the same way as the logically conservative epistemic theory. We are forced to accept the avowedly counter intuitive truth of "For some n, Fa_n & $\sim Fa_{n+1}$" which seems to postulate the existence of a sharp boundary yet the existence of just such a boundary is what the semantic theory of vagueness is supposed to deny.

Supervaluationists respond by denying that the conclusion of the line-drawing sorites expresses the existence of a sharp boundary. Though committed to the claim

(a) T '$\exists n\, (Fa_n \,\&\, \sim Fa_{n+1})$',

semantic precision is only properly captured by the claim that

(b) $\exists n$ T '$(Fa_n \,\&\, \sim Fa_{n+1})$'

and this is clearly denied by supervaluation theory. Whilst it is true that there is some cut-off point, there is no particular point of which it is true that it is the cut-off point. Since it is only this latter claim which is taken to commit one to the existence of a sharp boundary there is no commitment to there being such a boundary of which we are ignorant (contra the epistemic theorist).

With this explanation however, doubts arise as to the adequacy of the logic. Not only must (b) be properly taken to represent the semantic precision of '*F*' but we must also be prepared to admit that some existential statements can be true without having any true instance, thus blocking any inference from (a) to (b). Just as the failure of the metatheoretic principle of bivalence in conjunction with the retention of the law of excluded middle leads to the presence of true disjunctions lacking true disjuncts, so too must we countenance analogous non-standard behaviour in the logic's quantification theory. In effect, the counter intuitive aspects of the epistemic theory are avoided only at a cost to other intuitions.

At this point the supervaluationist might seek to explain the non-standard behaviour of the quantifiers, and for that matter the non-truth-functional two-place connectives, by showing how such behaviour follows from a proper understanding of the underlying phenomenon of vagueness. More exactly, the

suggestion is that a view of vagueness as merely semantic and in no way a reflection of any underlying phenomenon of ontological vagueness might underpin a supervaluationist approach to vagueness. Fine (1975) promotes this representational view of vagueness when defending the law of excluded middle for example. The suggestion would not only prescribe the counter intuitive aspects of supervaluation semantics but would also provide a principled justification of the common *de facto* linkage of supervaluation theory and a representational view of vagueness.

If this explanation is to be pursued then the formal machinery of supervaluation semantics dissolves the paradox only in conjunction with the metaphysical assumption of the impossibility of ontological vagueness. The metaphysical debate is ongoing.

The supervaluation approach has also come under fire for its semantic ascent into the metatheory when defusing the sorites. The problem with accepting the major premise of the mathematical induction sorites as false is simply that it runs counter to our conviction that a grain of wheat can make the difference between a heap and a non-heap; but this conviction can be expressed in the object-language, so why should the elaborate metalinguistic theory be relevant here?

As it happens, such assent is not essential to the account. The object language can be extended to include an operator ‘It is determinate (or definite) that ...’ (‘Det’) appropriate to the expression of vagueness in the object language. The vagueness of expressions like ‘heap’ is characterised by their possessing border cases; this can now be expressed as the existence of cases which are neither determinately heaps nor determinately non-heaps.

By means of the extended language, (a) and (b) are now recast as claims within the object language:

(a') $\text{Det}\ \exists n\ (Fa_n \ \&\ {\sim}Fa_{n+1})$

(b') $\exists n\ \text{Det}\ (Fa_n \ \&\ {\sim}Fa_{n+1})$.

The first is again affirmed and the latter denied. Any inference from (a') to (b') is analogous to the modal inference from ‘Nec $\exists x\ Fx$’ to ‘$\exists x$ Nec Fx’ and is seen as fallacious, just as the modal inference is commonly said to be. Vagueness, like modality, is viewed as *de dicto*, and, as in many modal logics, the resulting quantification theory reflects important scope distinctions.

Williamson (1994) points to two further problems which now beset the account. If the definition of validity as necessary truth-preservation is retained then classical inferences like *conditional proof*, *dilemma* and *reductio ad absurdum* are no longer valid. Moreover problems arise with regard to the phenomenon of higher order vagueness.

Many-Valued Logic

As alternatives to the non-truth-functional supervaluation semantics, non-classical logics have been proposed, and in particular, ‘many-valued logics’. Again vagueness is seen as grounds for rejecting the principle of bivalence, however truth-functionality is preserved. The approaches vary as regards the number of non-classical truth values deemed appropriate to model vagueness and defuse the sorites paradox.

An initial proposal, first developed in Halldén (1949) and Körner (1960) and recently revamped in Tye (1994), uses a three-valued logic. The motivation for such a logic is similar to the supervaluationist's. Just as a vague predicate divides objects into the positive extension, negative extension and the penumbra, vague sentences can be divided into the true, the false and the indeterminate. The truth-set is then {1 (true), 1/2 (indeterminate), 0 (false)}. Unlike supervaluation semantics, however, the connectives can then be defined by means of truth tables. There are a range of proposals with Kleene's strong three-valued tables as the preferred choice. (See Haack (1974), Appendix.)

The particular response to the sorites paradox then depends on the definition of validity adopted. A common generalisation of the concept of validity to many-valued logic involves the designation of certain values. A sentence holds (or is assertible) in a many-valued interpretation just if it takes a designated value. Validity is then defined as the necessary preservation of designated value. (In classical logic, of course, only truth is designated and thus the generalised concept reduces to the classical concept of necessary truth preservation.) There are then two non-trivial choices: let the set of designated values be {1} or {1, 1/2}. The former proposal results in a type (2) response, the latter a type (3) response.

If validity is defined as necessary preservation of truth-only then *modus ponens* and *cut* are valid and so, subsequently, is the conditional sorites. Yet not all its premises hold since they are not all true. Some conditional premise is considered to have a true antecedent and indeterminate consequent and so counts as indeterminate. Like supervaluationism such a logic may be said to be paracomplete, admitting non-trivial incomplete theories. (That is, a vague sentence ‘*A*’ and its negation ‘~*A*’ can both fail to be designated in an interpretation which nonetheless designates some sentences.)

If, on the other hand, validity is defined so that the conclusion of an argument is either true or indeterminate whenever the premises are either true or indeterminate then a paraconsistent logic results, admitting non-trivial inconsistent theories. (A vague sentence ‘*A*’ and its negation ‘~*A*’ might both be designated in an interpretation which nonetheless fails to designate every sentence.) Such an approach solves the sorites paradox by declaring it invalid. The premises hold since they are at worst indeterminate in truth-value, yet *modus ponens* is no longer valid. In an interpretation where ‘Fa_i’ is indeterminate and ‘Fa_{i+1}’ is false both ‘Fa_i’ and ‘If Fa_i then Fa_{i+1}’ are designated yet ‘Fa_{i+1}’ is not.

A general concern with three-valued approaches is that their tripartite division of sentences faces similar objections to those which led to the abandonment of the bipartite division effected by two-valued classical logic. Due to the phenomenon of higher order vagueness (in particular second order vagueness) there would seem to be no more grounds for supposing there to exist a sharp boundary between the true sentences and indeterminate ones or the indeterminate sentences and false sentences than there was for

supposing a sharp boundary to exist between the true sentences and the false ones. The phenomenon of vagueness which drives the sorites paradox no more suggests two sharp boundaries than it did one. Vague concepts appear to be concepts without boundaries at all. No finite number of divisions seems adequate. Tye (1994) seeks to avoid such difficulties by employing a vague metalanguage.

Goguen (1969) and Zadeh (1975) suggest replacing classical two-valued logic with an infinite-valued one. Infinite-valued or fuzzy logics have also been promoted for their recognition of degrees of truth. Just as baldness comes in degrees so too it is argued does the truth of sentences predicating baldness of things. The fact that John is more bald than Jo is reflected in the sentence 'John is bald' having a higher degree of truth than 'Jo is bald'. With this logical innovation infinite-valued logics are then offered as a means to solve the sorites paradox.

The classical two-valued truth set {0, 1} is replaced by set of real numbers in the interval [0, 1]. Sentences which are neither definitely true nor definitely false take values other than 0 or 1, but some number in between. As with all many-valued logics, the connectives can be defined in a number of ways, giving rise to a number of distinct logics. A standard proposal proceeds by way of the continuum-valued truth-functional semantics devised by Lukasiewicz. (See Haack (1974), Appendix.) As with the three-valued case, the type of response offered to the paradox depends on the definition of validity. If only the maximum value 1 is designated then the conditional form of the argument is valid, however the conditional premises are not completely true (that is, they do not take the value 1) and do not hold. The diagnosis of the paradox is that we mistake nearly true sentences for completely true ones and the error compounds each time a new conditional premise is invoked in the chain of reasoning. Beginning with a completely true categorical premise we thus proceed to heap neglected difference on neglected difference until finally complete falsity is reached. This type (2) response contrasts with another approach sometimes advocated.

In the foregoing account the laws of excluded middle and non-contradiction fail. Consider some sentence '*A*' with truth-value 1/2. By the definition of negation '~*A*' has value 1/2 and so their disjunction also has value 1/2, which is not designated. Thus the law of excluded middle fails. Similarly for the law of non-contradiction. To reinstate these classical laws one can consider all values in the interval [1, 1/2] as designated. In this case all premises of the paradox hold yet *modus ponens* fails and a type (3) response results. In an interpretation where 'Fa_i' takes the value 1/2 and 'Fa_{i+1}' takes the value 0 both 'Fa_i' and 'If Fa_i then Fa_{i+1}' take the value 1/2 and so are designated yet 'Fa_{i+1}' is not. Such a proposal is paraconsistent, admitting contradictions as sometimes taking a designated value; namely when a sentence and its negation both take the value 1/2. Other type (3) responses can be developed by taking the set of designated values to be the interval [1, n] where $1/2 < n < 1$.

There are, however, a number of problems which beset any infinite-valued approach to vagueness. Firstly, the very idea of a degree of truth needs explanation. Secondly, if numerical truth-values are to used some justification seems required for the particular truth-value assignments. Thirdly, the full implications of abandoning the well-understood classical theory in favour of degree theory need spelling out before a proper evaluation of its worth can be made. (On these points see Sainsbury (1995) Ch 2, sec.

6.) Furthermore, it is far from clear whether such an approach successfully avoids problems of higher order vagueness. And the assumption of a totally ordered truth-set is overly simple. Not all natural language sentences are comparable as regards their truth. Due to the multi-dimensional nature of a concept such as redness we may be unable to say of two reddish patches which differ in hue or brightness or colour-saturation whether one is redder than the other. (On these latter points see Williamson (1994) Ch 4, sec. 12-13.)

Embracing the Paradox

A final option is to simply embrace the paradox. (See Dummett (1975), Wright (1975).) Conditional sorites paradoxes are, contrary to appearances, sound. For example, no amount of grains of wheat makes a heap. This initial claim in favour of a universal type (4) response immediately runs into difficulty however with the realisation that, as noted above, such paradoxes come in pairs. There are negative and positive versions depending on whether the soritical predicate is negated or not. To accept all sorites as sound requires assent to the additional claim that, since one grain of wheat makes a heap, any number do. A radical incoherence follows since there is a commitment to all and any number both making a heap and not making a heap. Similarly, everyone is bald and no-one is; everyone is rich and no-one is, and so on.

The problem is that the soundness of any positive conditional sorites undercuts the truth of the unconditional premise of the corresponding negative version, and vice versa. Unless one is prepared to countenance the almost total pervasiveness of contradictions in natural language, it seems that not all sorites can be sound. Unger (1979) and Wheeler (1979) propose a more restricted embrace. Following dissatisfaction with responses of type (1) and (3) one accepts the applicability and validity of classical norms of reasoning. Nonetheless, dissatisfaction with responses of type (2) considered so far -- rejecting some conditional premise -- leaves open the possibility of either rejecting the unconditional premise or accepting it and, with it, the soundness of the paradox. What is advocated is the soundness of those sorites which deny heapness, baldness, hirsuteness, richness, poverty, etc. of everything -- a type (4) response -- and the corresponding falsity of the unconditional premise of all respective positive variants of the argument -- a type (2) response. Terms like ‘heap’, ‘bald’, ‘hirsute’, ‘rich’ and ‘poor’ apply to nothing. It is admitted that they apply to everything if they apply to anything, but the all-or-nothing choice is resolved in favour of the latter option. (See Williamson (1994) Ch 6.)

Logical Constructions

Bertrand Russell referred to several different definitions and philosophical analyses as providing "logical constructions" of certain entities and expressions. Examples he cited were the Frege/Russell definition of numbers as classes of equinumerous classes, the theory of definite descriptions, the construction of matter from sense data, and several others. Generally expressions for such entities are called "incomplete symbols" and the entities themselves "logical fictions". The notion originates with Russell's logicist program of reducing mathematics to logic, was widely used by Russell, and led to the later Logical Positivist notion of construction and ultimately the widespread use of set theoretic models in philosophy.

Honest Toil

Russell's most specific formulation of logical construction as a method in Philosophy comes from his essay "Logical Atomism":

> One very important heuristic maxim which Dr.Whitehead and I found, by experience, to be applicable in mathematical logic,and have since applied to various other fields, is a form of Occam's Razor. When some set of supposed entities has neat logical properties, it turns out, in a great many instances, that the supposed entities can be replaced by purely logical structures composed of entities which have not such neat properties. In that case, in interpreting a body of propositions hitherto believed to be about the supposed entities, we can substitute the logical structures without altering any of the detail of the body of propositions in question.This is an economy, because entities with neat logical properties are always inferred, and if the propositions in which they occur can be interpreted without making this inference, the ground for the inference fails, and our body of propositions is

> secured against the need of a doubtful step. The principle may be stated in the form: ‘Whenever possible, substitute constructions out of known entities for inferences to unknown entities’ (1924, p.160)

Russell was speaking of logical constructions in this memorable passage from his *Introduction to Mathematical Philosophy*: "The method of ‘postulating’ what we want has many advantages; they are the same as the advantages of theft over honest toil. Let us leave them to others and proceed with our honest toil." (1919, p. 71)

The notion of logical construction appears frequently with the idea that what is defined is a "logical fiction", and an "incomplete symbol". The latter term derives from the use of contextual definitions, providing an analysis of each sentence in which a defined symbol may occur without, however, giving an explicit definition, an equation or universal statement giving necessary and sufficient conditions for the application of the term in isolation. The terms "fiction" and "incomplete symbol" apply with differing aptness to various constructions.

Russell's first use of construction, and the model for later constructions, is the Frege/Russell definition of numbers as classes. This follows the kind of definitions used in the arithmetization of analysis of the preceding century, in particular, Dedekind's earlier construction of real numbers as bounded classes in the rational numbers. Russell's logicist program could not rest content with postulates for the fundamental objects of mathematics such as the Peano Axioms for the natural numbers. Instead numbers were to be defined as classes of equinumerous classes. Russell also refers to this method as "abstraction", now known as the abstraction of an equivalence class. The definition of equinumerosity, or of the existence of a one to one mapping between two classes, also called "similarity", is solely in terms of logical notions of quantifiers and identity. With the numbers defined, for example, two as the class of all two membered sets, or pairs, the properties of numbers could be derived by logical means alone.

Definite Descriptions and Classes

The most influential of Russell's constructions was the *theory of descriptions* from his paper "On Denoting" in 1905. Russell's theory provides an analysis of sentences of the form ‘The F is G’ where ‘The F’ is called a *definite decription*. The analysis proposes that ‘The F is G’ is equivalent to ‘There is one and only one F and it is G’. With this analysis, the logical properties of descriptions can now be deduced using just the logic of quantifiers and identity. Among the theorems in *14 of *Principia Mathematica* are those showing that, (1) if there is just one F then ‘The F is F’ is true, and if there is not, then ‘The F is G’ is always false and, crucially for the logical manipulation of descriptions, (2) if the F = the G, and the F is H, then the G is H. In other words, proper (uniquely referring) descriptions behave like singular terms. Some of these results are contentious---Strawson noted that ‘The present king of france is bald’ should be truth valueless since there is no present king of France, rather than "plainly false", as Russell's theory predicts.

The theory of descriptions introduces Russell's notion of *incomplete symbol*. Definite descriptions ‘The

F' do not show up in the formal analysis of sentences in which they occur, thus 'The F is H' becomes:

$$(\exists x) [(y)(Fy \leftrightarrow y=x) \& Hx]$$

of which no subformula, or continuous segment, can be identified as the analysis of 'The F'. Much as talk about "the average family" as in "The average family has 2.2 children" becomes "The number of children in families divided by the number of families = 2.2", there is no portion of that analysis that corresponds with "the average family". Instead we have a formula for eliminating such expressions from contexts in which they occur, hence the notion of "incomplete symbol" and the related "contextual definition". It is standard to see in this the origins of the distinction between between surface grammatical form and logical form, and thus the origin of linguistic analysis as a method in philosophy which operates by seeing past superficial linguistic form to underlying philosophical analysis. The theory of descriptions has been criticized by some linguists who see descriptions and other noun phrases as full fledged constituents of sentences, and who see the sharp distinction between grammatical and logical form as a mistake.

The theory of descriptions is often described as a model for avoiding ontological commitment to objects such as Meinongian subsistent entities, and so logical constructions in general are often seen as being chiefly aimed at ontological goals. In fact, that goal is at most peripheral to most constructions. Rather the goal is to allow the proof of propositions that would otherwise have to be assumed as axioms or hypotheses. Nor need the ontological goal be always elimination of problematic entities. Other constructions should be seen more as reductions of one class of entity to another, or replacements of one notion by a more precise, mathematical, substitute.

Russell's "No-Class" theory of classes from *20 of *Principia Mathematica* provides a contextual definition like the theory of descriptions. One of Russell's early diagnoses of the paradoxes was that they showed that classes could not be objects. Indeed he seems to have come across his paradox of the class of all classes that are not members of themselves by applying Cantor's argument to show that there are more classes of objects than objects. Hence, he concluded, classes could not be objects. Inspired by the theory of descriptions, Russell proposed that to say something G of the class of Fs, G{x: Fx}, is to say that there is some property H coextensive with (true of the same things as) F such that H is G. Extensionality of sets is thus derivable, rather than postulated. If F and H are coextensive then anything true of {x: Fx} will be true of {x: Hx}. Features of sets then follow from the features of the logic of properties, the "ramified theory of types". Because classes would seem to be individuals of some sort, but on analysis are found not to be, Russell speaks of them as "logical fictions", an expression which echoes Jeremy Bentham's notion of a "legal fiction". Because statements attributing a property to particular classes are analyzed by existential sentences saying that there is some propositional function having that property, this construction should not be seen as avoiding ontological commitment entirely, but rather of reducing classes to propositional functions. The properties of classes are really properties of propositional functions and for every class said to have a property there really is some propositional function having that property.

Other Constructions

For other constructions such as propositions a contextual definition is not provided. In any case, constructions do not appear as the referents of logically proper names, and so by that account are not part of the fundamental "furniture" of the world. (Early critical discussions of constructions, such as Wisdom's, stressed the contrast between logically proper names, which do refer, and constructions, which were thus seen as ontologically innocent.)

Beginning with *The Problems of Philosophy* in 1912, Russell turned repeatedly to the problem of matter. Part of the problem is to find a refution of Berkeleyan idealism, of showing how the existence and real nature of matter can be proved. In *Problems* Russell argues that matter is a well supported hypothesis that explains our experiences. Matter is known only indirectly, "by description", as the cause, whatever it may be, of our sense data, which we know "by acquaintance". This is the notion of hypothesis which Russell contrasts with construction in the passage above. Russell saw an analogy between the case of simply hypothesizing the existence of numbers with certain properties, those described by axioms, and hypothesizing the existence of matter. While we distinguish the certain knowledge we may have of mathematical entities from the contingent knowledge of material objects, Russell says that there are certain "neat" features of matter which are just too tidy to have turned out by accident. Examples include the most general spatiotemporal properties of objects, that no two can occupy the same place at the same time, and so on. Material objects are now to be seen as collections of sense data. Influenced by William James, Russell defended a "neutral monism" by which matter and minds were both to be constructed from sense data, but in different ways. Intuitively, the sense data occuring as they do "in" a mind, are material to construct that mind, the sense data derived from an object from different points of view to constructthat object. Russell saw some support for this in the theory of relativity, and the fundumental importance of frames of reference in the new physics.

These prominent examples are not the only use of the notion of construction in Russell's thought. In *Principia Mathematica* the *multiple relation* theory of propositions is introduced by saying that propositions are "incomplete symbols". Russell's multiple relation theory, that he held from 1910 to 1919 or so, argued that the constitituents of propositions, say ‘Desdemona loves Cassio’, which is false, are unified in a way that does not make it the case that they constitute a fact by themselves. Those constituents occur only in the context of beliefs, say, ‘Othello judges that Desdemona loves Cassio’. The real fact consists of a relation of Belief holding between the constituents Othello, Desdemona and Cassio, thus B(o, d , L, c). Because one might also have believed propositions of other structures, such as B (o, F, a) there need to be many such relations B, thus the "multiple" relation theory. Like the construction of numbers, this construction abstracts out what a number of occurrences of a belief have in common, a believer and various objects in a certain order. The analysis also makes the proposition an incomplete symbol because there is no constituent in the analysis of ‘x believes that p’ that corresponds to ‘p’.

Russell also suggests that propositional functions are logical constructions when he says that they are "nothing", but "nonetheless important for that". (1918, p. 96) Propositional functions are abstracted from their values, propositions. The propositional function ‘x is human’ is abstracted from its values ‘Socrates

is human', 'Plato is human' , etc. Viewing propositional functions as constructions from propositions which are in turn constructions by the multiple relation theory helps to make sense of the theory of types of propositional functions in *Principia Mathematica*. The notion of "incomplete symbol" does not make as much sense as "construction" when applied to propositional functions and propositions. This usage requires a broadening of the notion.

The notion of logical construction had a great impact on the future course of analytic philosophy. One line of influence was via the notion of a contextual definition, or paraphrase, intended to minimize ontological commitment and to be a model of philosophical analysis. The distinction between the surface appearance of definite descriptions, as singular terms, and the fully analyzed sentences from which they seem to disappear was seen as a model for making problematic notions disappear upon analysis. The theory of descriptions has been viewed as a paradigm of philosophical analysis.

A more technical strand in analytic philosophy was influenced by the construction of matter. Rudolf Carnap was attempted to carry out the construction of matter from sense data, and later Nelson Goodman continued the project. More generally, however, the use of set theoretic constructions became widespread among philosophers, and continues in the construction of set theoretic models, both in the sense of logic where they model formal theories, and as objects of interest in their own right.

Voluntary Euthanasia

The entry sets out five individually necessary conditions for anyone to be a candidate for legalised voluntary euthanasia (or, in some usages, physician-assisted suicide), outlines the moral case advanced by those in favour of legalising voluntary euthanasia, and discusses six of the more important objections made by those opposed to the legality of voluntary euthanasia.

Introduction

When a person commits an act of euthanasia he brings about the death of another person because he believes the latter's present existence is so bad that she would be better off dead, or believes that unless he intervenes and ends her life, it will become so bad that she would be better off dead. The motive of the person who commits an act of euthanasia is to benefit the one whose death is brought about. (Though what was just said also holds for many instances of physician-assisted suicide, some wish to restrict the use of the latter term to forms of assistance which stop short of the physician 'bringing about the death' of the patient, such as those involving mechanical means which have to be activated by the patient.)

Our concern will be with *voluntary* euthanasia—that is, with those instances of euthanasia in which a clearly competent person makes a voluntary and enduring request to be helped to die. There shall be occasion to mention *non-voluntary euthanasia*—instances of euthanasia where a person is either not competent to, or unable to, express a wish about euthanasia, and there is no one authorised to make a substituted judgment (wherein a proxy chooses as the no longer competent patient would have chosen had she remained competent)— in the context of considering the claim that permitting voluntary euthanasia will lead via a slippery slope to permitting non-voluntary euthanasia. Nothing will be said here about *involuntary euthanasia*, where a competent person's life is brought to an end despite an explicit

expression of opposition to euthanasia, beyond saying that, no matter how honourable the perpetrator's motive, such a death is, and ought to be, unlawful.

Debate about the morality and legality of voluntary euthanasia is, for the most part, a phenomenon of the second half of the twentieth century. Certainly, the ancient Greeks and Romans did not consider life needed to be preserved at any cost and were, in consequence, tolerant of suicide in cases where no relief could be offered to the dying or, in the case of the Stoics and Epicureans, where a person no longer cared for his life. In the sixteenth century, Thomas More, in describing a utopian community, envisaged such a community as one that would facilitate the death of those whose lives had become burdensome as a result of ‘torturing and lingering pain’. But it has only been in the last hundred years that there have been concerted efforts to make legal provision for voluntary euthanasia. Until quite recently there had been no success in obtaining such legal provision (though assisted suicide has been legally tolerated in Switzerland for many years). However, in, the nineteen seventies and eighties a series of court cases in The Netherlands culminated in agreement being reached between the legal and medical authorities to ensure that no physician would be prosecuted for assisting a patient to die as long as certain guidelines were strictly adhered to (see Griffiths, et al. 1998) In brief, the guidelines were established to permit physicians to practise voluntary euthanasia in instances where a competent patient had made a voluntary and informed decision to die, the patient's suffering was unbearable, there was no way of making that suffering bearable which was acceptable to the patient, and the physician's judgements as to diagnosis and prognosis were confirmed after consultation with another physician. In the nineteen nineties the first legislative approval for voluntary euthanasia was achieved with the passage of a bill in the parliament of Australia's Northern Territory to enable physicians to practise voluntary euthanasia. Subsequent to the Act's proclamation in 1996 it faced a series of legal challenges from opponents of voluntary euthanasia. In 1997 the challenges culminated in the Australian National Parliament overturning the legislation when it prohibited Australian Territories (the Australian Capital Territory and the Northern Territory) from enacting legislation to permit euthanasia. In Oregon in the United States legislation was introduced in 1997 to permit physician-assisted suicide when a second referendum clearly endorsed the proposed legislation. Later in 1997 the Supreme Court of the United States ruled that there is no constitutional right to physician-assisted suicide. However, the Court did not preclude individual States from legislating in favour of physician-assisted suicide. The Oregon legislation has, in consequence, remained operative and has been successfully utilised by a number of people. In November 2000 The Netherlands passed legislation to legalise the practice of voluntary euthanasia. The legislation passed through all the parliamentary stages early in 2001 and so became law. The Belgium parliament passed similar legislation in May 2002.

With that brief sketch of the historical background in place, we now proceed to set out the conditions which those who have advocated making voluntary euthanasia legally permissible have wished to insist should be satisfied. The conditions are stated with some care so as to focus the moral debate about legislation. Second, we shall go on to outline the positive moral case underpinning the push to make voluntary euthanasia legally permissible. Third, we shall then consider the more important of the morally grounded objections which have been advanced by those opposed to the legalisation of voluntary euthanasia.

Five Individually Necessary Conditions for Candidacy for Voluntary Euthanasia

Advocates of voluntary euthanasia contend that if a person is

> (a) suffering from a terminal illness;
>
> (b) unlikely to benefit from the discovery of a cure for that illness during what remains of her life expectancy;
>
> (c) as a direct result of the illness, either suffering intolerable pain, or only has available a life that is unacceptably burdensome (because the illness has to be treated in ways which lead to her being unacceptably dependent on others or on technological means of life support);
>
> (d) has an enduring, voluntary and competent wish to die (or has, prior to losing the competence to do so, expressed a wish to die in the event that conditions (a)-(c) are satisfied); and
>
> (e) unable without assistance to commit suicide,

then there should be legal and medical provision to enable her to be allowed to die or assisted to die.

It should be acknowledged that these conditions are quite restrictive, indeed more restrictive than some would think appropriate. In particular, the conditions concern access only to voluntary euthanasia for those who are *terminally ill*. While that expression is not free of all ambiguity, for present purposes it can be agreed that it does not include the bringing about of the death of, say, victims of accidents who are rendered quadriplegic or victims of early Alzheimer's Disease. Those who consider that such cases show the first condition to be too restrictive may nonetheless accept that including them would, at least for the time being, make it far harder to obtain legal protection for helping those terminally ill persons who wish to die. The fifth condition further restricts access to voluntary euthanasia by excluding those capable of ending their own lives, and so will not only be thought unduly restrictive by those who think physician-assisted suicide a better course to follow, but will be considered morally much harder to justify by those who think health care practitioners may never justifiably kill their patients. More on this anon.

The second condition is intended simply to reflect the fact that we normally are able to say that someone's health status is incurable. So-called ‘miracle’ cures may be spoken of by sensationalist journalists, but progress toward medical breakthroughs is typically painstaking. If there are miracles wrought by God that will be quite another matter entirely, but it is at least clear that not everyone's death is thus to be staved off.

The third condition recognises what many who oppose the legalisation of voluntary euthanasia do not, namely that it is not only release from pain that leads people to want to be helped to die. In The Netherlands, for example, it has been found to be a less significant reason for requesting assistance with dying than other forms of suffering and frustration with loss of independence. Sufferers from some terminal conditions may have their pain relieved but have to endure side effects that for them make life unbearable. Others may not have to cope with pain but instead be incapable, as with motor neurone disease, of living without life supports which at the same time rob their lives of quality.

A final preliminary point is that the fourth condition requires that the choice to die not only be voluntary but that it be made in an enduring (not merely a one-off) way and be competent. The choice is one that will require discussion and time for reflection and so should not be settled in a moment. As in other decisions affecting matters of importance, normal adults are presumed to choose voluntarily unless the presence of defeating considerations can be established. The onus of establishing lack of voluntariness or lack of competence is on those who refuse to accept the person's choice. There is no need to deny that it can sometimes be met (e.g. by pointing to the person's being in a state of clinical depression). The claim is only that the onus falls on those who deny that a normal adult's choice is not competent.

A Moral Case for Voluntary Euthanasia

The central ethical argument for voluntary euthanasia—that respect for persons demands respect for their autonomous choices as long as those choices do not result in harm to others—is directly connected with this issue of competence (cp. Brock, 1992) because autonomy presupposes competence. People have an interest in making important decisions about their lives in accordance with their own conception of how they want their lives to go. In exercising autonomy or self-determination people take responsibility for their lives and, since dying is a part of life, choices about the manner of their dying and the timing of their death are, for many people, part of what is involved in taking responsibility for their lives. Most people are concerned about what the last phase of their lives will be like, not merely because of fears that their dying might involve them in great suffering, but also because of the desire to retain their dignity and as much control over their lives as possible during this phase.

The technological interventions of modern medicine have had an effect on how drawn out the dying phase may be. Sometimes this added life is an occasion for rejoicing, sometimes it may serve to stretch out the period of significant physical and intellectual decline in such a way as to impair and burden the end of life so that life comes to be no longer worth living. There is no single, objectively correct answer, which has application to everyone, as to when, if at all, life becomes a burden and unwanted. But that simply points up the importance of individuals being able to decide autonomously for themselves whether their own lives retain sufficient quality and dignity. In making such decisions individuals decide about the mix between their self-determination and their well-being that suits them. Given that a critically ill person is typically in a severely compromised and debilitated state it is, other things being equal, the patient's judgement of whether continued life is a benefit that must carry the greatest weight, provided always that the patient is competent.

Suppose it is agreed that a person's exercise of her autonomy warrants our respect. If medical assistance is to be provided to help a person achieve her autonomously chosen goal of an easeful death (because she cannot end her own life), the autonomy of the assisting professional(s) also has to be respected. The value (or right) of self-determination does not entitle a patient to compel a medical professional to act contrary to her own moral or professional values. If voluntary euthanasia is to be legally permitted it must be against a backdrop of respect for professional autonomy. Thus, if a doctor's view of her moral or professional responsibilities is at odds with the request of her patient for euthanasia, provision must be made for the transfer of the patient's care to another who faces no such conflict.

Opponents of voluntary euthanasia have endeavoured to counter this very straightforward moral case for the practice in a variety of ways. Some of the counter-arguments are concerned only with whether the moral case warrants making the practice of voluntary euthanasia legal, others are concerned with trying to undermine the moral case itself. In what follows, consideration will be given to the six most important of the counter-arguments. (Some less important moral objections to the practice of voluntary euthanasia are considered in Young, 1976, esp. pp. 265-275.)

Six Objections to the Moral Permissibility of Voluntary Euthanasia

Objection 1

It is often said that it is not necessary nowadays for anyone to die while suffering from intolerable or overwhelming pain. We are getting better at providing effective palliative care and hospice care is available. Given these considerations it is urged that voluntary euthanasia is unnecessary.

There are several flaws in this counter-argument. First, while both good palliative care and hospice care make important contributions to the care of the dying neither is a panacea. To get the best palliative care for an individual involves trial and error with some consequent suffering in the process. But, far more importantly, even high quality palliative care commonly exacts a price in the form of side effects such as nausea, incontinence, loss of awareness because of semi-permanent drowsiness, and so on. A rosy picture is often painted as to how palliative care can transform the plight of the dying. Such a picture is misleading according to those who have closely observed the effect of extended courses of treatment with drugs like morphine, a point acknowledged as well by many skilled palliative care specialists. Second, though the sort of care provided through hospices is to be applauded, it is care that is available only to a small proportion of the terminally ill and then usually only in the very last stages of the illness (typically a matter of a few weeks). Third, the point of greatest significance is that not everyone wishes to avail themselves of either palliative care or hospice care. For those who prefer to die in their own way and in their own time neither palliative care nor hospice care may be attractive. For many dying patients it is having their autonomous wishes frustrated that is a source of the deepest distress. Fourth, as indicated earlier when the conditions under which voluntary euthanasia is advocated were outlined, not everyone who is dying is suffering because of the pain occasioned by their illness. For those for whom what is

intolerable is their dependence on others or on machinery, the availability of effective pain control will be quite irrelevant.

Objection 2

A second, related objection to permitting the legalisation of voluntary euthanasia is to the effect that we never have sufficient evidence to be justified in believing that a dying person's request to be helped to die is competent, enduring and genuinely voluntary.

Notice first that a request to die may not reflect an enduring desire to die (cf. some attempts to commit suicide may similarly reflect temporary despair). That is why advocates of voluntary euthanasia have argued that normally a cooling off period should be allowed. But that said, the objection claims we can *never* be justified in believing someone's request to die reflects a settled preference for death. This goes too far. If someone discusses the issue with others on different occasions, or reflects on the issue over an extended period, and does not waver in her conviction, her wish to die is surely an enduring one.

But, it might be said, what if a person is racked with pain, or befuddled because of the measures taken to relieve her pain, and so not able to think clearly and rationally about the alternatives? It has to be agreed that a person in those circumstances who wants to die cannot be assumed to have a competent, enduring and genuinely voluntary desire to die. However, there are at least two important points to make about those in such circumstances. First, they do not account for all of the terminally ill, so even if it is acknowledged that such people are incapable of agreeing to voluntary euthanasia that does not show that no one can ever voluntarily request help to die. Second, it is possible for a person to indicate in advance of losing the capacity to give competent, enduring and voluntary consent, how she would wish to be treated should she become terminally ill and be suffering intolerably from pain or from loss of control over her life. ‘Living wills’ or ‘advance declarations’ are legally useful instruments for giving voice to people's wishes while they are capable of giving competent, enduring and voluntary consent, including to their wanting help to die. As long as they are easily revocable in the event of a change of mind (just as ordinary wills are), they should be respected as evidence of a well thought out conviction. It should be noted, though, that any request for voluntary euthanasia or physician-assisted suicide will not be able lawfully to be implemented (outside of The Netherlands, Belgium and Oregon).

Perhaps, though, what is really at issue in this objection is whether anyone can ever form a competent, enduring and voluntary wish about being better off dead rather than continuing to suffer from an illness *before actually suffering the illness*. If this is what underlies the objection it is surely too paternalistic to be acceptable. Why cannot a person have sufficient inductive evidence (e.g. based on the experience of the deaths of friends or family) to know her own mind and act accordingly?

Objection 3

According to one interpretation of the traditional ‘doctrine of double effect’ it is permissible to act in ways which it is foreseen will have bad consequences provided only that

(a) this occurs as a side effect (or indirectly) to the achievement of the act which is directly aimed at or intended;

(b) the act directly aimed at is itself morally good or, at least, morally neutral;

(c) the good effect is not achieved by way of the bad, that is, the bad must not be a means to the good; and

(d) the bad consequences must not be so serious as to outweigh the good effect.

In line with the doctrine of double effect it is, for example, held to be permissible to alleviate pain by administering drugs like morphine which it is foreseen will shorten life, whereas to give an overdose or injection with the direct intention of terminating a patient's life (whether at her request or not) is considered morally indefensible. This is not the appropriate forum to give full consideration to this doctrine. However, there is one vital criticism to be made of the doctrine concerning its relevance to the issue of voluntary euthanasia. With that point made we will be able to turn to the more general question of the moral permissibility of intentional killing.

The criticism of the relevance of the doctrine of double effect to any critique of voluntary euthanasia, at least on what seems to me to be a defensible reading of that doctrine, is simply this: the doctrine can only be relevant where a person's death is an evil or, to put it another way, a *harm*. Sometimes 'harm' is understood simply as damage to a person's interest whether consented to or not. At other times it is more strictly understood as wrongfully inflicted damage. On either account, if the death of a person who wishes to die is not harmful (because from that person's standpoint it is, in fact, beneficial), the doctrine of double effect can have no relevance to the debate about the permissibility of voluntary euthanasia. (For an extended discussion of the doctrine of double effect and its bearing on the moral permissibility of voluntary euthanasia see McIntyre, 2001.)

Objection 4

There is a widespread belief that passive (voluntary) euthanasia, where life-sustaining or life-prolonging measures are withdrawn or withheld, is morally acceptable because steps are simply not taken which could preserve or prolong life (and so a patient is allowed to die), whereas active (voluntary) euthanasia is not, because it requires an act of killing. The distinction, despite its widespread popularity, is very unclear. Whether behaviour is described in terms of acts or omissions (which underpins the alleged distinction between active and passive (voluntary) euthanasia), is generally a matter of pragmatics not of anything of deeper importance. Consider, for instance, the practice of deliberately proceeding slowly to a ward in response to a request to provide assistance for a patient who is subject to a 'not for resuscitation' code. Or consider 'pulling the plug' on an oxygen machine keeping an otherwise dying patient alive as against not replacing the tank when it runs out. Are these acts or omissions; cases of passive euthanasia or active euthanasia?

More fundamentally, though, those who think some reliance can be placed on the distinction think that, at least in a medical context, killing is morally worse than letting die. Consider the case of a patient suffering from motor neurone disease who is completely respirator dependent, finds her condition intolerable, and competently and persistently requests to be removed from the respirator so that she may die. Even the Catholic Church in recent times has been prepared to agree in cases like this one to the turning off of the respirator. Is this merely a case of letting the patient die?

It is often said that even if *motives* and *consequences* are agreed to be in common, if someone's life is *intentionally* terminated she has been killed, whereas if she is no longer being aggressively treated her life is not ended by the withdrawal of such aggressive treatment but by the underlying disease.One way to show that it is in most cases implausible to think that the withdrawal of life sustaining measures involves no intention to terminate the patient's life is to consider the growing practice of withholding artificial nutrition and hydration in those instances where a decision has been made to cease aggressive treatment, and then to see if we can generalise to cases like that of the motor neurone sufferer (cf. Winkler, 1995). Many physicians would say that their intention in withholding life-sustaining artificial nutrition is simply to respect the patient's wishes, and this is plausible in those instances where the patient is still able competently to ask for such treatment no longer to be given (or the patient's proxy makes the request). However, unless there has been such a request from a competent patient (or the patient's proxy), the best explanation of the physician's behaviour in withdrawing life-sustaining nutrition will be that the physician intends thereby to end the life of the patient. Permanently withdrawing nutrition from someone in, say, an irreversible coma (a persistent vegetative state), thereby starving the patient, is not merely to foresee that death will ensue, but to intend the death. What could be the point of the action, the goal aimed at, the intended outcome, if not the ending of the patient's life? No sense can be made of the action as being intended to serve to palliate the disease, or to keep the patient comfortable, or even, in the case of a person in a permanently vegetative state, as allowing the underlying disease to carry the person off. The loss of brain activity is not going to kill the person. What is going to kill the patient is the act of starving her to death. That is the clear intention, not merely something foreseen as an unfortunate side effect, but in no way aimed at.

Can this claim be extended to other circumstances than those involving the withdrawal of life-sustaining nutrition? The giving of massive doses of morphine, way beyond what is needed to control pain, or the removal of a respirator from a sufferer from motor neurone disease would seem, by parallel reasoning, to amount to the intentional bringing about of the death of the person being cared for.

So that there is no misunderstanding, it should be conceded that there are circumstances where doctors can truthfully say that actions which they perform, or omissions which they make, do lead to the deaths of their patients without them intending that those patients should die. Thus, for instance, if a patient refuses life prolonging medical treatment because she considers it useless, it might reasonably be said that the doctor's intention in complying is simply to respect the patient's wishes. But the point made earlier was of much wider significance and was aimed at showing that it is utterly stilted to claim, as some doctors do, that it can never be the intention in performing certain actions and omissions to intend to bring about death and hence that those actions and omissions cannot count as killings.

Two final points need to be added to round off the discussion of the fourth objection. First, much of the debate surrounding the objection is premised on the belief that killing, at least in medical contexts, cannot morally be justified. For that reason alone the medical profession has long found psychological comfort in the belief that even if killing cannot be justified it is quite another thing to allow a patient to die (where that involves no negligence) because there the cause of death is natural. This underlying assumption is one that is open to challenge (and has been challenged in e.g. Rachels, 1986, chs. 7, 8; Kuhse, 1987). First, there will be cases, namely those where someone who has requested assistance to die and is allowed to die, rather than killed, where it is morally worse to allow to die because all that does is prolong the patient's suffering. The second point to make is that despite the longstanding legal doctrine that no one can justifiably consent to be killed (on which more later), it surely is relevant to the justification of an act of killing someone that she has autonomously decided that that would be best for her.

Objection 5

It is often said that if society allows *voluntary* euthanasia to be legally permitted we will have set foot on a slippery slope that will lead us inevitably to support other forms of euthanasia, especially non-voluntary euthanasia. Whereas it was once the common refrain that that was precisely what happened in Hitler's Germany, nowadays the claim tends to be that the experience of The Netherlands in the last decade or so confirms the reality of the slippery slope. Slippery slope arguments come in at least three different versions: logical, psychological and arbitrary line. What the different forms share is the contention that once the first step is taken on a slippery slope the subsequent steps follow inexorably, whether for logical reasons, psychological reasons or to avoid arbitrariness in ‘drawing a line’ across a person's actions. (For further discussion see e.g. Rachels, 1986, ch. 10; Brock, 1992, pp. 19ff.).

We first consider why, at the theoretical level, none of these forms of argument appears powerful enough to trouble an advocate of the legalisation of voluntary euthanasia. We then comment on the alleged empirical support from the experiences of Hitler's Germany and The Netherlands of today for the existence of a slippery slope beginning from voluntary euthanasia.

There is nothing logically inconsistent in supporting voluntary euthanasia but rejecting non-voluntary euthanasia as morally inappropriate. Since the two issues are logically separate there will be some advocates of voluntary euthanasia who will wish also to lend their support to some acts of non-voluntary euthanasia (e.g. for those in persistent vegetative states who have never indicated their wishes about being helped to die or for some severely disabled infants for whom the outlook is hopeless). Others will think that what may be done with the consent of the patient sets a strict limit on the practice of euthanasia. The difference is not one of logical acumen. It has to be located in the respective values of the different supporters (e.g. whether self-determination alone or the best interests of a person should prevail).

As regards the alleged psychological inevitability of moving from voluntary to non-voluntary euthanasia (where there is no way of knowing the patient's views because the patient is neither competent nor has made any provision for a proxy to make a substituted judgment), again it is hard to see the alleged inevitability. Why should it be supposed that those who value the autonomy of the individual and so

support provision for voluntary euthanasia will, as a result, find it psychologically easier to kill patients who are not able competently to request assistance with dying? What reason is there to believe that they will, as a direct result of their support for voluntary euthanasia, be psychologically driven to practise non-voluntary euthanasia?

Finally, if there is nothing arbitrary about distinguishing voluntary euthanasia from non-voluntary euthanasia (because the line between them is based on clear principles) there can be no substance to the charge that there is a slide from voluntary to non-voluntary euthanasia that can only be prevented by arbitrarily drawing a line between them.

What, though, of Hitler's Germany and The Netherlands of today? The former is easily dismissed as a provider of evidence for an inevitable descent from voluntary euthanasia to non-voluntary. There never was a policy in favor of, or a legal practice of, voluntary euthanasia in Germany in the 1920s to the 1940s (see, for example, Burleigh (1994)). There was, prior to Hitler coming to power, a clear practice of killing some disabled persons. The justification was never suggested to be that their being killed was in *their* best interests, rather it was said to be society that benefited. Hitler's later revival of the practice and its widening to take in other groups such as Jews and gypsies was part of a program of *eugenics*, not euthanasia.

Since the publication of the Remmelink Report in 1991 into the medical practice of euthanasia in The Netherlands it has frequently been said that the Dutch experience shows decisively that legally protecting voluntary euthanasia is impossible without also affording protection to the non-voluntary euthanasia that will come in its train. Unfortunately, many of those who have made this claim have paid insufficient attention to the serious studies carried out by van der Maas, *et al.* (1991), and van der Wal, *et al.* (1992a and 1992b) into what the Report revealed. In a second nation-wide investigation of physician-assisted dying in the Netherlands carried out in 1995 a similar picture emerged as had in the earlier Remmelink Report. Again no evidence was found of any descent down a slippery slope toward ignoring people's voluntary choices to be assisted to die (see van der Maas, *et al.* (1996); van der Wal, *et al.* (1996); Griffiths, *et al.* (1998)). The true picture is that, of those terminally ill persons assisted to die under the agreement between the legal and medical authorities, a little over one half were clearly cases of voluntary euthanasia as it has been characterised in this article. Of the remainder, the vast majority of cases were of patients who at the time of the assisted death were no longer competent. The deaths of some of these were brought about by withdrawal of treatment, that of others by interventions such as the giving of lethal doses of anaesthetics. But there are two critical points to be made: first, in the overwhelming majority of such cases the decision to end life was taken after consultation between the doctor(s) and family members and, second, according to the researchers, most of the cases are to be seen as like the practice common in other countries where voluntary euthanasia is not legally tolerated of giving large doses of opioids to relieve pain knowing all the while that this will also end life. It is true that in a very few cases of this kind there was no consultation with relatives, only with other medical personnel. This is explained by the researchers as having occurred because families in The Netherlands strictly have no final authority to act as surrogate decision-makers for incompetent persons. That there have only been a handful of prosecutions of Dutch doctors for failing to follow agreed procedures (Griffiths, *et al.* (1998)), that none of the doctors prosecuted has had a significant penalty imposed, and that the Dutch public have regularly

reaffirmed their support for those agreed procedures suggests that, contrary to the claims of some critics of The Netherlands' experience of legally protecting voluntary euthanasia, social life has not broken down. Indeed, such studies as have been published about what happens in other countries, like Australia (see Kuhse, *et al.* (1997)), where no legal protection is in place, suggest that the pattern of things in The Netherlands and elsewhere is quite similar. If active euthanasia is widely practised but in ways that are not legally recognized there is apt in fact to be more danger that the distinction between voluntary cases and non-voluntary ones will be blurred or ignored than in a situation where the carrying out of euthanasia is transparent and subject to monitoring.

We can bring this discussion of the fifth objection to a close with two observations. First, nothing that has been said should be taken as suggesting that there is no need to put in place safeguards against potential abuse of any legal protection for voluntary euthanasia. This is particularly important for those who have become incompetent by the time decisions need to be taken about assisting them to die. As was mentioned very early on, there are ways of addressing this issue (such as by way of advance declarations or living wills) which are widely thought to be effective, even if they are not perfect. The main point to be stressed at the present, though, is that there is surely no need for anyone to be frightened into thinking that the legalisation of voluntary euthanasia will inevitably end in her having her life snatched away from her should she become incapable of exercising a competent judgement on her own behalf. Second, it is, of course, possible that the reform of any law may have unintended effects. It is sometimes said in discussions about legalising voluntary euthanasia that experience with abortion law reform should remind us of how quickly and easily practices can become accepted which were never among the reformers' intentions, and that the same thing could occur if voluntary euthanasia were to become legally permitted. No amount of theorising, it is said, can gainsay that possibility. There is no need to deny that it is possible that reform of the laws that presently prohibit voluntary euthanasia could have untoward consequences. However, if the arguments given above are sound (and the Dutch experience is not only the best evidence we have that they are sound, but the *only* relevant evidence), that does not seem very likely.

Objection 6

I turn now to the final objection to be considered here. It is often claimed that whatever the morality of an individual's deciding for herself that her life is no longer of value to her, that provides no basis for the formulation of public policy. The fear of the slippery slope is, no doubt, part of the concern expressed here. But, as well, there are concerns about the role of the law and more particularly, its contribution to the regulation of medicine.

Legal permission for doctors to perform voluntary euthanasia cannot simply be grounded in the right of self-determination of patients. We have already had occasion to note that the law does not presently permit an individual to consent to her own death. Nevertheless, the very same fundamental basis of the right to decide about life-sustaining treatment—respect for a person's autonomy—underpins voluntary euthanasia as well. Extending the right of self-determination to cover cases of voluntary euthanasia would not, therefore, amount to a dramatic shift in legal policy. No novel legal values or principles need to be invoked. Indeed, the fact that suicide and attempted suicide are no longer criminal offences in many jurisdictions indicates that the central importance of individual self-determination in a closely analogous

setting has been accepted. The fact that assisted suicide and voluntary euthanasia have not yet been widely decriminalised is probably best explained along the lines that have frequently been offered for excluding consent of the victim as a justification for an act of killing, namely the difficulties thought to exist in establishing the genuineness of the consent. The establishment of suitable procedures for giving consent to assisted suicide and voluntary euthanasia would seem to be no harder than establishing procedures for competently refusing burdensome or otherwise unwanted medical treatment. The latter has already been accomplished in many jurisdictions, so the former should be capable of establishment as well.

Suppose that the moral case for legalising voluntary euthanasia does come to be judged as stronger than the case against (as the drift of this article would imply), and voluntary euthanasia is made legally permissible. Should doctors take part in the practice? Should only doctors perform voluntary euthanasia? The proper administration of medical care is not at odds with an understanding of medical care that both promotes patients' welfare interests and respects their self-determination. It is these twin values which should guide medical care, not a commitment to preserving life at all costs, or preserving life without regard to whether patients want their lives prolonged when they judge that life is no longer of benefit or value to themselves. Many doctors in The Netherlands and, to judge from available survey evidence, in other Western countries as well, see the practice of (voluntary) euthanasia as not only compatible with their professional commitments but also with their conception of the best medical care for the dying. That being so, they should not be prohibited by law from lending their professional assistance to those competent, terminally ill persons for whom no cure is possible and who wish for an easy death.

Aristotle's Political Theory

Aristotle (b. 384 - d. 322 BC), was a Greek philosopher, logician, and scientist. Along with his teacher Plato, Aristotle is generally regarded as one of the most influential ancient thinkers in a number of philosophical fields, including political theory. Aristotle was born in Stagira in northern Greece, and his father was a court physician to the king of Macedon. As a young man he studied in Plato's Academy in Athens. After Plato's death he left Athens to conduct philosophical and biological research in Asia Minor and Lesbos, and he was then invited by King Philip II of Macedon to tutor his young son, Alexander the Great. Soon after Alexander succeeded his father, consolidated the conquest of the Greek city-states, and launched the invasion of the Persian Empire. Aristotle returned as a resident alien to Athens, and was close friend of Antipater the Macedonian viceroy. At this time (335-323 BC) he wrote or at least completed some of his major treatises, including the *Politics*. When Alexander died suddenly, Aristotle had to flee from Athens because of his Macedonian connections, and he died soon after. Aristotle's life seems to have influenced his political thought in various ways: his interest in biology seems to be expressed in the naturalism of his politics; his interest in comparative politics and his sympathies for democracy as well as monarchy may have been encouraged by his travels and experience of diverse political systems; he criticizes harshly, while borrowing extensively, from Plato's *Republic*, *Statesman*, and *Laws*; and his own *Politics* is intended to guide rulers and statesmen, reflecting the high political circles in which he moved.

1. Political Science in General

The modern word 'political' derives from the Greek *politikos*, 'of, or pertaining to, the polis'. (The Greek term *polis* will be translated here as 'city-state'. It is also translated as 'city' or 'polis', or simply anglicized as 'polis'. City-states like Athens and Sparta were relatively small and cohesive units, in which political, religious, and cultural concerns were intertwined. The extent of their similarity to modern nation-states is controversial.) Aristotle's word for 'politics' is *politikê*, which is short for *politikê epistêmê* or 'political science'. It belongs to one of the three main branches of science, which Aristotle distinguishes by their ends or objects. Contemplative science (including physics and metaphysics) is concerned with truth or knowledge for its own sake; practical science with good action; and productive science with making useful or beautiful objects (*Top*. VI.6.145a14-16, *Met*. VI.1.1025b24, XI.7.1064a16-19, *EN* VI.2.1139a26-8). Politics is a practical science, since it is concerned with the noble action or happiness of the citizens (although it resembles a productive science in that it seeks to create, preserve, and reform political systems.) Aristotle thus understands politics as a normative or prescriptive discipline rather than as a purely empirical or descriptive inquiry.

In *Nicomachean Ethics* I.2 Aristotle characterizes politics as the most authoritative science. It prescribes which sciences are to be studied in the city-state, and the other capacities -- such as military science, household management, and rhetoric -- fall under its authority. Since it governs the other practical sciences, their ends serve as means to its end, which is nothing less than the human good. "Even if the end is the same for an individual and for a city-state, that of the city-state seems at any rate greater and more complete to attain and preserve. For although it is worthy to attain it for only an individual, it is nobler and more divine to do so for a nation or city-state." (*EN* I.2.1094b7-10) Aristotle's political science encompasses the two fields which modern philosophers distinguish as ethics and political philosophy. (See the entry on Aristotle's ethics.) Political philosophy in the narrow sense is roughly speaking the subject of his treatise called the *Politics*. For a further discussion of this topic, see the following supplementary document:

> Supplement: Characteristics and Problems of Aristotle's Politics

2. Aristotle's View of Politics

Political science studies the tasks of the politician or statesman (*politikos*), in much the way that medical science concerns the work of the physician (see *Politics* IV.1). It is, in fact, the body of knowledge that such practitioners, if truly expert, will also wield in pursuing their tasks. The most important task for the politician is, in the role of lawgiver (*nomothetês*), to frame the appropriate constitution for the city-state. This involves enduring laws, customs, and institutions (including a system of moral education) for the citizens. Once the constitution is in place, the politician needs to take the appropriate measures to maintain it, to introduce reforms when he finds them necessary, and to prevent developments which might subvert the political system. This is the province of legislative science, which Aristotle regards as more important than politics as exercised in everyday political activity such as the passing of decrees (see *EN*

VI.8).

Aristotle frequently compares the politician to a craftsman. The analogy is imprecise because politics, in the strict sense of legislative science, is a form of practical wisdom or prudence, but valid to the extent that the politician produces, operates, and maintains a legal system according to universal principles (*EN* VI.8 and X.9). In order to appreciate this analogy it is helpful to observe that Aristotle explains production of an artifact in terms of four causes: the material, formal, efficient, and final causes (*Phys*. II.3 and *Met*. A.2). For example, clay (material cause) is molded into a vase shape (formal cause) by a potter (efficient or moving cause) so that it can contain liquid (final cause). (For discussion of the four causes see the entry on Aristotle's physics.)

One can also explain the existence of the city-state in terms of the four causes. It is a kind of community (*koinônia*), that is, a collection of parts having some functions and interests in common (*Pol*. II.1.1261a18, III.1.1275b20). Hence, it is made up of parts, which Aristotle describes in various ways in different contexts: as households, or economic classes (e.g., the rich and the poor), or demes (i.e., local political units). But, ultimately, the city-state is composed of individual citizens (see III.1.1274a38-41), who, along with natural resources, are the "material" or "equipment" out of which the city-state is fashioned (see VII.14.1325b38-41).

The formal cause of the city-state is its constitution (*politeia*). Aristotle defines the constitution as "a certain ordering of the inhabitants of the city-state" (III.1.1274b32-41). He also speaks of the constitution of a community as "the form of the compound" and argues that whether the community is the same over time depends on whether it has the same constitution (III.3.1276b1-11). The constitution is not a written document, but an immanent organizing principle, analogous to the soul of an organism. Hence, the constitution is also "the way of life" of the citizens (IV.11.1295a40-b1, VII.8.1328b1-2). Here the citizens are that minority of the resident population who are adults with full political rights.

The existence of the city-state also requires an efficient cause, namely, its ruler. On Aristotle's view, a community of any sort can possess order only if it has a ruling element or authority. This ruling principle is defined by the constitution, which sets criteria for political offices, particularly the sovereign office (III.6.1278b8-10; cf. IV.1.1289a15-18). However, on a deeper level, there must be an efficient cause to explain why a city-state acquires its constitution in the first place. Aristotle states that "the person who first established [the city-state] is the cause of very great benefits" (I.2.1253a30-1). This person was evidently the lawgiver (*nomothetês*), someone like Solon of Athens or Lycurgus of Sparta, who founded the constitution. Aristotle compares the lawgiver, or the politician more generally, to a craftsman (*dêmiourgos*) like a weaver or shipbuilder, who fashions material into a finished product (II.12.1273b32-3, VII.4.1325b40-1365a5).

The notion of final cause dominates Aristotle's *Politics* from the opening lines:

> Since we see that every city-state is a sort of community and that every community is established for the sake of some good (for everyone does everything for the sake of what

> they believe to be good), it is clear that every community aims at some good, and the community which has the most authority of all and includes all the others aims highest, that is, at the good with the most authority. This is what is called the city-state or political community. [I.1.1252a1-7]

Soon after, he states that the city-state comes into being for the sake of life but exists for the sake of the good life (2.1252b29-30). The theme that the good life or happiness is the proper end of the city-state recurs throughout the *Politics* (III.6.1278b17-24, 9.1280b39; VII.2.1325a7-10).

To sum up, the city-state is a hylomorphic (i.e., matter-form) compound of a particular population (i.e., citizen-body) in a given territory (material cause) and a constitution (formal cause). The constitution itself is fashioned by the lawgiver and is governed by politicians, who are like craftsmen (efficient cause), and the constitution defines the aim of the city-state (final cause, IV.1.1289a17-18). For a further discussion of this topic, see the following supplementary document:

> Supplement: Presuppositions of Aristotle's Politics

It is in these terms that Aristotle understands the fundamental normative problem of politics: What constitutional form should the lawgiver and politician establish and preserve in what material for the sake of what end?

3. General Theory of Constitutions and Citizenship

Aristotle states that "the politician and lawgiver is wholly occupied with the city-state, and the constitution is a certain way of organizing those who inhabit the city-state" (III.1.1274b36-8). His general theory of constitutions is set forth in *Politics* III. He begins with a definition of the citizen (*politês*), since the city-state is by nature a collective entity, a multitude of citizens. Citizens are distinguished from other inhabitants, such as resident aliens and slaves; and even children and seniors are not unqualified citizens (nor are most ordinary workers). After further analysis he defines the citizen as a person who has the right (*exousia*) to participate in deliberative or judicial office (1275b18-21). In Athens, for example, citizens had the right to attend the assembly, the council, and other bodies, or to sit on juries. The Athenian system differed from a modern representative democracy in that the citizens were more directly involved in governing. Although full citizenship tended to be restricted in the Greek city-states (with women, slaves, foreigners, and some others excluded), the citizens were more deeply enfranchised than in modern representative democracies because they were more directly involved in governing. This is reflected in Aristotle's definition of the citizen (without qualification). Further, he defines the city-state (in the unqualified sense) as a multitude of such citizens which is adequate for a self-sufficient life (1275b20-21).

Aristotle defines the constitution as a way of organizing the offices of the city-state, particularly the sovereign office (III.6.1278b8-10; cf. IV.1.1289a15-18). The constitution thus defines the governing body, which takes different forms: for example, in a democracy it is the people, and in an oligarchy it is a select few (the wealthy or well born). Before attempting to distinguish and evaluate various constitutions

Aristotle considers two questions. First, why does a city-state come into being? He recalls the thesis, defended in *Politics* I.2, that human beings are by nature political animals, who naturally want to live together. For a further discussion of this topic, see the following supplementary document:

> Supplement: Political Naturalism

He then adds that "the common advantage also brings them together insofar as they each attain the noble life. This is above all the end for all both in common and separately." (III.6.1278b19-24) Second, what are the different forms of rule by which one individual or group can rule over another? Aristotle distinguishes several types. He first considers despotic rule, which is exemplified in the master-slave relationship. Aristotle thinks that this form of rule is justified in the case of natural slaves who (he asserts without evidence) lack a deliberative faculty and thus need a natural master to direct them (I.13.1260a12; slavery is defended at length in *Politics* I.4-8). Although a natural slave allegedly benefits from having a master, despotic rule is still primarily for the sake of the master and only incidentally for the slave (III.6.1278b32-7). (Aristotle provides no argument for this: if some persons are congenitally incapable of self-governance, why should they not be ruled primarily for their own sakes?) He next considers paternal and marital rule, which he also views as defensible: "the male is by nature more capable of leadership than the female, unless he is constituted in some way contrary to nature, and the elder and perfect [is by nature more capable of leadership] than the younger and imperfect." (I.12.1259a39-b4) Aristotle is persuasive when he argues that children need adult supervision because their rationality is "imperfect" (*ateles*) or immature. But he also alleges (without substantiation) that, although women have a deliberative faculty, it is "without authority" (*akuron*), so that females require male leadership (I.13.1260a13-14). (Aristotle's arguments about slaves and women appear so weak that some commentators take them to be ironic. However, what is obvious to a modern reader need not have been so to an ancient Greek, so that it is not necessary to suppose that Aristotle's discussion is ironic.) It is noteworthy, however, that paternal and marital rule are properly practiced for the sake of the ruled (for the sake of the child and of the wife respectively), just as arts like medicine or gymnastics are practiced for the sake of the patient (III.6.1278b37-1279a1). In this respect they resemble political rule, which involves equal and similar citizens taking turns in ruling for one another's advantage (1279a8-13). This sets the stage for the fundamental claim of Aristotle's constitutional theory: "constitutions which aim at the common advantage are correct and just without qualification, whereas those which aim only at the advantage of the rulers are deviant and unjust, because they involve despotic rule which is inappropriate for a community of free persons" (1279a17-21).

The distinction between correct and deviant constitutions is combined with the observation that the government may consist of one person, a few, or a multitude. Hence, there are six possible constitutional forms (*Politics* I.7):

	Correct	**Deviant**
One Ruler	Kingship	Tyranny

Few Rulers	Aristocracy	Oligarchy
Many Rulers	Polity	Democracy

This six-fold classification (which is adapted from Plato's *Statesman*) sets the stage for Aristotle's inquiry into the best constitution, although it is modified in various ways throughout the *Politics*. For example, he observes that the dominant class in oligarchy (literally rule of the *oligoi*, i.e., few) is typically the wealthy, whereas in democracy (literally rule of the *dêmos*, i.e., people) it is the poor, so that these economic classes should be included in the definition of these forms (see *Politics* III.8, IV.4, and VI.2 for alternative accounts). Also, polity is later characterized as a kind of "mixed" constitution typified by rule of the "middle" group of citizens, a moderately wealthy class between the rich and poor (*Politics* IV.11).

Aristotle turns to arguments for and against the different constitutions, which he views as different applications of the principle of distributive justice (III.9.1280a7-22). Everyone agrees, he says, that justice involves treating equal persons equally, and treating unequal persons unequally, but they do not agree on the standard by which individuals are deemed to be equally (or unequally) meritorious or deserving. He assumes his own analysis of distributive justice set forth in *Nicomachean Ethics* V.3: Justice requires that benefits be distributed to individuals in proportion to their merit or desert. The oligarchs mistakenly think that those who are superior in wealth should also have superior political rights, whereas the democrats hold that those who are equal in free birth should also have equal political rights. Both of these conceptions of political justice are mistaken in Aristotle's view, because they assume a false conception of the ultimate end of the city-state. The city-state is neither a business association to maximize wealth (as the oligarchs suppose) nor an agency to promote liberty and equality (as the democrats maintain). Instead, Aristotle argues, "the good life is the end of the city-state," that is, a life consisting of noble actions (1280b39-1281a4). Hence, the correct conception of justice is aristocratic, assigning political rights to those who make a full contribution to the political community, that is, to those with virtue as well as property and freedom (1281a4-8). This is what Aristotle understands by an "aristocratic" constitution: literally, the rule of the *aristoi*, i.e., best persons. Aristotle explores the implications of this argument in the remainder of *Politics* III, considering the rival claims of the rule of law and the rule of a supremely virtuous individual. Here absolute kingship is a limiting case of aristocracy. Again, in books VII-VIII, Aristotle describes the ideal constitution in which the citizens are fully virtuous.

4. Study of Specific Constitutions

The purpose of political science is to guide "the good lawgiver and the true politician" (IV.1.1288b27). Like any complete science or craft, it must study a range of issues concerning its subject matter. For example, gymnastics (physical training) studies what sort of training is advantageous for what sort of body, what sort of training is best or adapted to the body that is naturally the best, what sort of training is best for most bodies, and what capacity is appropriate for someone who does not want the condition or knowledge appropriate for athletic contests. Political science studies a comparable range of constitutions

(1288b21-35): first, the constitution which is best without qualification, i.e., "most according to our prayers with no external impediment"; second, the constitution that is best under the circumstances "for it is probably impossible for many persons to attain the best constitution"; third, the constitution which serves the aim a given city-state population happens to have, i.e., the one that is best "based on a hypothesis": "for [the political scientist] ought to be able to study a given constitution, both how it might originally come to be, and, when it has come to be, in what manner it might be preserved for the longest time; I mean, for example, if a particular city happens neither to be governed by the best constitution, nor to be equipped even with necessary things, nor to be the [best] possible under existing circumstances, but to be a baser sort."

Hence, Aristotelian political science is not confined to the ideal system, but also investigates the second-best constitution, the one which is the best that most city-states are capable of supporting. For it is the closest approximation to full political justice which the lawgiver can attain under the circumstances. Although Aristotle’s political views were influenced by his teacher Plato, he is very critical of the ideal city-state set forth in Plato’s *Republic* on the grounds that it overvalues political unity, it embraces a system of communism that is impractical and inimical to human nature, and it neglects the happiness of the individual citizens (*Politics* II.1-5). In contrast, in Aristotle’s own "best constitution" (described in *Politics* VII-VIII) each and every citizen will possess moral virtue and the equipment to carry it out in practice, and thereby attain a life of excellence and complete happiness (see VII.13.1332a32-8). All of the citizens will hold political office and possess private property because "one should call the city-state happy not by looking at a part of it but at all the citizens." (VII.9.1329a22-3). Moreover, there will be a common system of education for all the citizens, because they share the same end (*Pol*. VIII.1). But if (as is the case with most city-states) the population lacks the capacities and resources for complete happiness, the lawgiver must be content with fashioning a suitable constitution (*Politics* IV.11). The second-best system typically takes the form of a polity (in which citizens possess an inferior, more common grade of virtue) or mixed constitution (combining features of democracy, oligarchy, and aristocracy, so that no group of citizens is in a position to abuse its rights).

In addition, the political scientist must understand existing constitutions even when they are bad. Aristotle adds that "to reform a constitution is no less a task [of politics] than it is to establish one from the beginning," and in this way "the politician should also help existing constitutions." (IV.1.1289a1-7) The political scientist should also be cognizant of forces of political change which can undermine an existing regime. Aristotle criticizes his predecessors for excessive utopianism and neglect of the practical duties of a political theorist. However, he is no Machiavellian. The best constitution still serves as a regulative ideal by which to evaluate existing systems.

These topics occupy the remainder of the *Politics*. Books IV-VI are concerned with the existing constitutions: that is, the three deviant constitutions, as well as polity or the mixed constitution, the best attainable under most circumstances (IV.2.1289a26-38). The whole of book V investigates political change and revolution. Books VII-VIII are devoted to the ideal constitution. As might be expected, Aristotle’s attempt to carry out this program involves many difficulties, and scholars disagree about how the two series of books (IV-VI and VII-VIII) are related to each other: for example, which were written first, which were intended to be read first, and whether they are ultimately consistent with each other. For

a further discussion of this topic, see the following supplementary document:

> [Supplement: Characteristics and Problems of Aristotle's Politics]

Aristotle's *Politics* did not have an immediate impact because it defended the Greek city-state, which was already becoming obsolete in his own lifetime. (As mentioned above, the Greek city-states permanently lost their independence due to the conquest by the kings of Macedon.) For similar reasons much of his discussion of particular political institutions is not directly applicable to modern nation-states (apart from his objectionable defenses of slavery, female subservience, and disenfranchisement of the working classes). Even so, Aristotle's *Politics* has had a deep influence on political philosophy until the present day, because it contains deep and thought-provoking discussions of perennial concerns of political philosophy: the role of human nature in politics, the relation of the individual to the state, the place of morality in politics, the theory of political justice, the rule of law, the analysis and evaluation of constitutions, the relevance of ideals to practical politics, the causes and cures of political change and revolution, and the importance of a morally educated citizenry.

Glossary of Aristotelian Terms

- action: *praxis*
- citizen: *politês*
- city-state: *polis*
- community: *koinônia*)
- constitution: *politeia*
- excellence: *aretê* (also 'virtue')
- free: *eleutheros*
- good: *agathos*
- happiness: eudaimonia
- happy: *eudaimôn*
- justice: *dikaiosunê*
- law: *nomos*
- lawgiver: *nomothetês*
- master: *despotês*
- nature: *phusis*
- noble: *kalon* (also 'beautiful')
- political: *politikos* (of, or pertaining to, the *polis*)
- political science: *politikê epistêmê*
- practical: *praktikos*
- practical wisdom: *phronêsis*
- right: *exousia*
- ruler: *archôn*
- self-sufficient: *autarkês*
- sovereign: *kurios*

- without qualification: *haplôs* (also 'absolute')
- without authority: *akuron*

Supplement to Aristotle's Politics

Characteristics and Problems of Aristotle's Politics

The work which has come down to us under this name appears to be less an integrated treatise than a collection of essays on various topics in political philosophy, which may have been compiled by a later editor rather than by Aristotle. The following topics are discussed in the eight books:

> I Naturalness of the city-state and of the household
>
> II Critique of ostensibly best constitutions
>
> III General theory of constitutions
>
> IV Inferior constitutions
>
> V Preservation and destruction of constitutions
>
> VI Further discussion of democracy and oligarchy
>
> VII-VIII Blueprint of the best constitution

This ordering of the books reflects, very roughly, the program for the study of constitutions which concludes the Nicomachean Ethics:

First, then, if any particular point has been treated well by those who have gone before us, we must try to review it; then from the constitutions that have been collected we must try to see what it is that preserves and destroys each of the constitutions, and for what reasons some city-states are well governed and others the reverse. For when these things have been examined, we will perhaps better understand what sort of constitution is best, and how each is structured, and which laws and customs it uses. Let us then begin our discussion. [X.9.1181b15-23]

However, scholars have raised problems with the Politics as we have it. The first concerns the intended order of its eight books. Some (including W. L. Newman) have questioned the traditional ordering, arguing that the discussion of the best constitution (books VII-VIII) should follow directly after book III. Indeed, book III concludes with a transition to a discussion of the best constitution (although this may be due to a later editor). However, cross-references between various passages of the Politics indicate that books IV-V-VI form a connected series, as do books VII-VIII, but these series do not refer to each other.

However, both series refer back to book III which in turn refers to book I. With some oversimplification, the Politics is comparable to a tree trunk supporting two separate branches: the root system is I, the trunk is II-III, and the branches are IV-V-VI and VII-VIII. (The summary in Nicomachean Ethics X.9 describes only the visible part of the tree.)

The second problem concerns the order in which the books were actually written. If they were composed at very different dates, they might represent discordant stages in the development of Aristotle's political philosophy. For example, Werner Jaeger argued that books VII-VIII contain a youthful utopianism, motivating Aristotle to emulate his teacher Plato in erecting "an ideal state by logical construction." In contrast, books IV-VI are based on "sober empirical study." Other scholars have seen a more pragmatic, even Machiavellian approach to politics in books IV-VI. A difficulty for this interpretation is that in book IV Aristotle regards the business of constructing ideal constitutions as perfectly compatible with that of addressing actual political problems. Although much ink has been spilled since Jaeger attempted to discern different chronological strata in the Politics, it has not resulted in a clear scholarly consensus. Because there is no explicit evidence of the dates at which the various books of the Politics were written, argument has turned on alleged inconsistencies between different passages.

This leads to the third problem, whether there are major inconsistencies of doctrine or method in the Politics. For example, Aristotle's account of the best constitution assumes his theory of justice, a moral standard which cannot be met by the actual political systems (democracies and oligarchies) of his own day. He does discuss practical political reforms in books IV-VI but more in terms of stability than justice. This raises the question of whether books IV-VI mark a radical departure from the political philosophy of the other books. Resolution of this problem requires careful study of the Politics as a whole.

Supplement to Aristotle's Politics

Presuppositions of Aristotle's Politics

Aristotle's political philosophy is distinguished by its underlying philosophical doctrines. Of these the following four principles are especially noteworthy:

(1) The principle of teleology Aristotle begins the *Politics* by invoking the concept of nature (see Political Naturalism). In the Physics Aristotle identifies the nature of a thing above all with its end or final cause (Phys. II.2.194a28-9, 8.199b15-18). The end of a thing is also its function (*EE* II.1.1219a8), which is its defining principle (*Meteor*. IV.12.390a10-11). On Aristotle's view plants and animals are cardinal examples of natural existents, because they have a nature in the sense of an internal causal principle which explains how it comes into being and behaves (*Phys*. II.1.192b32-3). For example, an acorn has an inherent tendency to grow into an oak tree, so that the tree exists by nature rather than by craft or by chance. The thesis that human beings have a natural function has a fundamental place in th*e Eudemian Ethics* II.1, *Nicomachean Ethics* I.7, and *Politics* I.2. The *Politics* further argues that it is part of the nature of human beings that they are political or adapted for life in the city-state. Thus teleology is crucial for the political naturalism which is at the foundation of Aristotle's political philosophy. (For discussion of teleology see the entry on Aristotle, biology.)

(2) The principle of perfection Aristotle understands good and evil in terms of his teleology. The natural end of the organism (and the means to this end) is good for it, and what defeats or impedes this end is bad. For example, he argues that animals sleep in order to preserve themselves, because "nature operates for the sake of an end, and this is a good," and sleeping is necessary and beneficial for entities which cannot move continuously (*De Somno* 2.455b17-22). For human beings the ultimate good or happiness (*eudaimonia*) consists in perfection, the full attainment of their natural function, which Aristotle analyzes as the activity of the soul according to reason (or not without reason), i.e., activity in accordance with the most perfect virtue or excellence (*EN* I.7.1098a7-17). This also provides a norm for the politician: "What is most choiceworthy for each individual is always the highest it is possible for him to attain" (*Pol*. VII.14.1333a29-30; cf. *EN* X.7.1177b33-4). This ideal is to be realized in both the individual and the city-state: "that way of life is best, both separately for each individual and in common for city-states, which is equipped with virtue" (*Pol*. VII.1.1323b40-1324a1). However, Aristotle recognizes that it is generally impossible to fully realize this ideal, in which case he invokes a fall-back principle: it is best to attain perfection, but, failing that, a thing is better in proportion as it is nearer to the end (see *DC* II.12.292b17-19).

Aristotle's perfectionism was opposed to the subjective relativism of Protagoras, according to which good and evil is defined by whatever human beings happened to desire. Like Plato, Aristotle maintained that the good was objective and independent of human wishes. However, he rejected Plato's own theory that

the good was defined in terms of a transcendent form of the good, holding instead that good and evil are in a way relative to the organism, that is, to its natural end.

(3) The principle of community Aristotle maintains that the city-state is the most complete community, because it attains the limit of self-sufficiency, so that it can exist for the sake of the good life (*Pol*. I.2.1252b27-30). Individuals outside of the city-state are not self-sufficient, because they depend on the community not only for material necessities but also for education and moral habituation. "Just as, when perfected, a human is the best of animals, so also when separated from law and justice, he is the worst of all" (1253a31-3). On Aristotle's view, then, human beings must be subject to the authority of the city-state in order to attain the good life. The following principle concerns how authority should be exercised within a community.

(4) Principle of rulership Aristotle believes that the existence and well-being of any system requires the presence of a ruling element: "Whenever a thing is established out of a number of things and becomes a single common thing, there always appears in it a ruler and ruled. . . . This [relation] is present in living things, but it derives from all of nature." (1254a28-32)

Just as an animal or plant can survive and flourish only if its soul rules over its body (Pol. I.5.1254a34-6, DA I.5.410b10-15; compare Plato Phaedo 79e-80a), a human community can possess the necessary order only if it has a ruling element which is in a position of authority, just as an army can possess order only if it has a commander in control. Although Aristotle followed Plato on this principle, he rejected Plato's further claim that one form of rule is appropriate for all. For Aristotle different forms of rule are necessary for different systems: e.g., political rule for citizens and despotic rule for slaves. The imposition of an inappropriate type of rule results in disorder and injustice.

The aforementioned principles account for much of the distinctive flavor of Aristotle's political philosophy, and they also indicate where many modern theorists have turned away from him. Modern philosophers such as Thomas Hobbes have challenged the principles of teleology and perfectionism, arguing against the former that human beings are mechanistic rather than teleological systems, and against the latter that good and bad depend upon subjective preferences of valuing agents rather than on objective states of affairs. Liberal theorists have criticized the principle of community on the grounds that it cedes too much authority to the state. Even the principle of rulership which Aristotle, Plato, and many other theorists thought self-evident has come under fire by modern theorists like Adam Smith and F. A. Hayek who argued that social and economic order may arise spontaneously as if by an "invisible hand." Modern neo-Aristotelian political theorists are committed to defending one or more of these doctrines against such criticisms.

Supplement to Aristotle's Politics

Political Naturalism

Aristotle lays the foundations for his political theory in Politics book I by arguing that the city-state and political rule are "natural." The argument begins with a schematic, quasi-historical account of the development of the city-state out of simpler communities. First, individual human beings combined in pairs because they could not exist apart. The male and female joined in order to reproduce, and the master and slave came together for self-preservation. The natural master uses his intellect to rule, and the natural slave uses his body to labor. Second, the household arose naturally from these primitive communities in order to serve everyday needs. Third, when several households combined for other needs a village emerged also according to nature. Finally, "the complete community, formed from several villages, is a city-state, which at once attains the limit of self-sufficiency, roughly speaking. It comes to be for the sake of life, and exists for the sake of the good life." (I.2.1252b27-30)

Aristotle defends three claims about nature and the city-state: First, the city-state exists by nature, because it comes to be out of the more primitive natural associations and it serves as their end, because only it attains self-sufficiency (1252b30-1253a1). Second, human beings are by nature political animals, because nature, which does nothing in vain, has equipped them with speech, which enables them to communicate moral concepts such as justice which are formative of the household and city-state (1253a1-18). Third, the city-state is naturally prior to the individuals, because individuals cannot perform their natural functions apart from the city-state, since they are not self-sufficient (1253a18-29). However, these three claims are immediately followed by a fourth: the city-state is a creation of human intelligence. "Therefore, everyone naturally has the impulse for such a [political] community, but the person who first established [it] is the cause of very great benefits." This great benefactor is evidently the lawgiver, for the legal system of the city-state makes human beings just and virtuous and lifts them from the savagery in which they would otherwise languish (1253a29-39).

Aristotle's political naturalism presents the difficulty that he does not explain how he is using the term "nature" (phusis). In the Physics nature is understood as an internal principle of motion or rest (see III.1.192b8-15). (For discussion of nature see Aristotle's Physics.) If the city-state were natural in this sense, it would resemble a plant or an animal which grows naturally to maturity out of a seed. However, this cannot be reconciled with the important role which Aristotle also assigns to the lawgiver as the one who established the city-state. For on Aristotle's theory a thing either exists by nature or by craft; it cannot do both. (This difficulty is posed by David Keyt.) Aristotle can seemingly escape this dilemma only if it is supposed that he speaks of the city-state as "natural" in another sense of the term. For example, he might mean that it is "natural" in the extended sense that it arises from human natural inclinations (to live in communities) for the sake of human natural ends, but that it remains unfinished until a lawgiver provides it with a constitution. (This solution was proposed by Ernest Barker and is

defended more recently by Fred Miller and Trevor Saunders.)

Homosexuality

The term ‘homosexuality’ was coined in the late 19th century by a German psychologist, Karoly Maria Benkert. Although the term is new, discussions about sexuality in general, and same-sex attraction in particular, have occasioned philosophical discussion ranging from Plato's *Symposium* to contemporary queer theory. Since the history of cultural understandings of same-sex attraction is relevant to the philosophical issues raised by those understandings, it is necessary to review briefly some of the social history of homosexuality. Arising out of this history, at least in the West, is the idea of natural law and some interpretations of that law as forbidding homosexual sex. References to natural law still play an important role in contemporary debates about homosexuality in religion, politics, and even courtrooms. Finally, perhaps the most significant recent social change involving homosexuality is the emergence of the gay liberation movement in the West. In philosophical circles this movement is, in part, represented through a rather diverse group of thinkers who are grouped under the label of queer theory. A central issue raised by queer theory, which will be discussed below, is whether homosexuality, and hence also heterosexuality and bisexuality, is socially constructed or purely driven by biological forces.

History

As has been frequently noted, the ancient Greeks did not have terms or concepts that correspond to the contemporary dichotomy of ‘heterosexual’ and ‘homosexual’. There is a wealth of material from ancient Greece pertinent to issues of sexuality, ranging from dialogues of Plato, such as the *Symposium*, to plays by Aristophanes, and Greek artwork and vases. What follows is a brief description of ancient Greek attitudes, but it is important to recognize that there was regional variation. For example, in parts of Ionia there were general strictures against same-sex *eros*, while in Elis and Boiotia (e.g., Thebes), it was

approved of and even celebrated (cf. Dover, 1989; Halperin, 1990).

Probably the most frequent assumption of sexual orientation is that persons can respond erotically to beauty in either sex. Diogenes Laeurtius, for example, wrote of Alcibiades, the Athenian general and politician of the 5th century B.C., “in his adolescence he drew away the husbands from their wives, and as a young man the wives from their husbands.” (Quoted in Greenberg, 1988, 144) Some persons were noted for their exclusive interests in persons of one gender. For example, Alexander the Great and the founder of Stoicism, Zeno of Citium, were known for their exclusive interest in boys and other men. Such persons, however, are generally portrayed as the exception. Furthermore, the issue of what gender one is attracted to is seen as an issue of taste or preference, rather than as a moral issue. A character in Plutarch's *Erotikos* (*Dialogue on Love*) argues that “the noble lover of beauty engages in love wherever he sees excellence and splendid natural endowment without regard for any difference in physiological detail.” (*Ibid*., 146) Gender just becomes irrelevant “detail” and instead the excellence in character and beauty is what is most important.

Even though the gender that one was erotically attracted to (at any specific time, given the assumption that persons will likely be attracted to persons of both sexes) was not important, other issues were salient, such as whether one exercised moderation. Status concerns were also of the highest importance. Given that only free men had full status, women and male slaves were not problematic sexual partners. Sex between freemen, however, was problematic for status. The central distinction in ancient Greek sexual relations was between taking an active or insertive role, versus a passive or penetrated one. The passive role was acceptable only for inferiors, such as women, slaves, or male youths who were not yet citizens. Hence the cultural ideal of a same-sex relationship was between an older man, probably in his 20's or 30's, known as the *erastes*, and a boy whose beard had not yet begun to grow, the *eromenos* or *paidika*. In this relationship there was courtship ritual, involving gifts (such as a rooster), and other norms. The *erastes* had to show that he had nobler interests in the boy, rather than a purely sexual concern. The boy was not to submit too easily, and if pursued by more than one man, was to show discretion and pick the more noble one. There is also evidence that penetration was often avoided by having the *erastes* face his beloved and place his penis between the thighs of the *eromenos*, which is known as intercrural sex. The relationship was to be temporary and should end upon the boy reaching adulthood (Dover, 1989). To continue in a submissive role even while one should be an equal citizen was considered troubling, although there certainly were many adult male same-sex relationships that were noted and not strongly stigmatized. While the passive role was thus seen as problematic, to be attracted to men was often taken as a sign of masculinity. Greek gods, such as Zeus, had stories of same-sex exploits attributed to them, as did other key figures in Greek myth and literature, such as Achilles and Hercules. Plato, in the *Symposium*, argues for an army to be comprised of same-sex lovers. Thebes did form such a regiment, the Sacred Band of Thebes, formed of 500 soldiers. They were renowned in the ancient world for their valor in battle.

Ancient Rome had many parallels in its understanding of same-sex attraction, and sexual issues more generally, to ancient Greece. This is especially true under the Republic. Yet under the Empire, Roman society slowly became more negative in its views towards sexuality, probably due to social and economic turmoil, even before Christianity became influential.

Exactly what attitude the New Testament has towards sexuality in general, and same-sex attraction in particular, is a matter of sharp debate. John Boswell argues, in his fascinating *Christianity, Social Tolerance, and Homosexuality*, that many passages taken today as condemnations of homosexuality are more concerned with prostitution, or where same-sex acts are described as “unnatural” the meaning is more akin to ‘out of the ordinary’ rather than as immoral (Boswell, 1980, ch.4; see also Boswell, 1994). Yet others have criticized, sometimes persuasively, Boswell's scholarship (see Greenberg, 1988, ch.5). What is clear, however, is that while condemnation of same-sex attraction is marginal to the Gospels and only an intermittent focus in the rest of the New Testament, early Christian church fathers were much more outspoken. In their writings there is a horror at any sort of sex, but in a few generations these views eased, in part due no doubt to practical concerns of recruiting converts. By the fourth and fifth centuries the mainstream Christian view allowed for procreative sex.

This viewpoint, that procreative sex within marriage is allowed, while every other expression of sexuality is sinful, can be found, for example, in St. Augustine. This understanding leads to a concern with the gender of one's partner that is not found in previous Greek or Roman views, and it clearly forbids homosexual acts. Soon this attitude, especially towards homosexual sex, came to be reflected in Roman Law. In Justinian's Code, promulgated in 529, persons who engaged in homosexual sex were to be executed, although those who were repentant could be spared. Historians agree that the late Roman Empire saw a rise in intolerance towards sexuality, although there were again important regional variations.

With the decline of the Roman Empire, and its replacement by various barbarian kingdoms, a general tolerance (with the sole exception of Visigothic Spain) of homosexual acts prevailed. As one prominent scholar puts it, “European secular law contained few measures against homosexuality until the middle of the thirteenth century.” (Greenberg, 1988, 260) Even while some Christian theologians continued to denounce nonprocreative sexuality, including same-sex acts, a genre of homophilic literature, especially among the clergy, developed in the eleventh and twelfth centuries (Boswell, 1980, chapters 8 and 9).

The latter part of the twelfth through the fourteenth centuries, however, saw a sharp rise in intolerance towards homosexual sex, alongside persecution of Jews, Muslims, heretics, and others. While the causes of this are somewhat unclear, it is likely that increased class conflict alongside the Gregorian reform movement in the Catholic Church were two important factors. The Church itself started to appeal to a conception of “nature” as the standard of morality, and drew it in such a way so as to forbid homosexual sex (as well as extramarital sex, nonprocreative sex within marriage, and often masturbation). For example, the first ecumenical council to condemn homosexual sex, Lateran III of 1179, stated that “Whoever shall be found to have committed that incontinence which is against nature” shall be punished, the severity of which depended upon whether the transgressor was a cleric or layperson (quoted in Boswell, 1980, 277). This appeal to natural law (discussed below) became very influential in the Western tradition. An important point to note, however, is that the key category here is the ‘sodomite,’ which differs from the contemporary idea of ‘homosexual’. A sodomite was understood as act-defined, rather than as a type of person. Someone who had desires to engage in sodomy, yet did not act upon them, was not a sodomite. Also, persons who engaged in heterosexual sodomy were also sodomites. There are

reports of persons being burned to death or beheaded for sodomy with a spouse (Greenberg, 1988, 277). Finally, a person who had engaged in sodomy, yet who had repented of his sin and vowed to never do it again, was no longer a sodomite. The gender of one's partner is again not of decisive importance, although some medieval theologians single out same-sex sodomy as the worst type of sexual crime.

For the next several centuries in Europe, the laws against homosexual sex were severe in their penalties. Enforcement, however, was episodic. In some regions, decades would pass without any prosecutions. Yet the Dutch, in the 1730's, mounted a harsh anti-sodomy campaign (alongside an anti-Gypsy pogrom), even using torture to obtain confessions. As many as one hundred men and boys were executed and denied burial (Greenberg, 1988, 313-4). Also, the degree to which sodomy and same-sex attraction were accepted varied by class, with the middle class taking the narrowest view, while the aristocracy and nobility often accepted public expressions of alternative sexualities. At times, even with the risk of severe punishment, same-sex oriented subcultures would flourish in cities, sometimes only to be suppressed by the authorities. In the 19th century there was a significant reduction in the legal penalties for sodomy. The Napoleonic code decriminalized sodomy, and with Napoleon's conquests that Code spread. Furthermore, in many countries where homosexual sex remained a crime, the general movement at this time away from the death penalty usually meant that sodomy was removed from the list of capital offenses.

In the 18th and 19th centuries an overtly theological framework no longer dominated the discourse about same-sex attraction. Instead, secular arguments and interpretations became increasingly common. Probably the most important secular domain for discussions of homosexuality was in medicine, including psychology. This discourse, in turn, linked up with considerations about the state and its need for a growing population, good soldiers, and intact families marked by clearly defined gender roles. Doctors were called in by courts to examine sex crime defendants (Foucault, 1980; Greenberg, 1988). At the same time, the dramatic increase in school attendance rates and the average length of time spent in school, reduced transgenerational contact, and hence also the frequency of transgenerational sex. Same-sex relations between persons of roughly the same age became the norm.

Clearly the rise in the prestige of medicine resulted in part from the increasing ability of science to account for natural phenomena on the basis of mechanistic causation. The application of this viewpoint to humans led to accounts of sexuality as innate or biologically driven. The voluntarism of the medieval understanding of sodomy, that sodomites chose sin, gave way to the modern notion of homosexuality as a deep, unchosen characteristic of persons, regardless of whether they act upon that orientation. The idea of a ‘latent sodomite’ would not have made sense, yet under this new view it does make sense to speak of a person as a ‘latent homosexual.’ Instead of specific acts defining a person, as in the medieval view, an entire physical and mental makeup, usually portrayed as somehow defective or pathological, is ascribed to the modern category of ‘homosexual.’ Although there are historical precursors to these ideas (e.g., Aristotle gave a physiological explanation of passive homosexuality), medicine gave them greater public exposure and credibility (Greenberg, 1988, ch.15). The effects of these ideas cut in conflicting ways. Since homosexuality is, by this view, not chosen, it makes less sense to criminalize it. Persons are not choosing evil acts. Yet persons may be expressing a diseased or pathological mental state, and hence medical intervention for a cure is appropriate. Hence doctors, especially psychiatrists, campaigned for the

repeal or reduction of criminal penalties for consensual homosexual sodomy, yet intervened to "rehabilitate" homosexuals. They also sought to develop techniques to prevent children from becoming homosexual, for example by arguing that childhood masturbation caused homosexuality, hence it must be closely guarded against.

In the 20th century sexual roles were redefined once again. For a variety of reasons, premarital intercourse slowly became more common and eventually acceptable. With the decline of prohibitions against sex for the sake of pleasure even outside of marriage, it became more difficult to argue against gay sex. These trends were especially strong in the 1960's, and it was in this context that the gay liberation movement took off. Although gay and lesbian rights groups had been around for decades, the low-key approach of the Mattachine Society (named after a medieval secret society) and the Daughters of Bilitis had not gained much ground. This changed in the early morning hours of June 28, 1969, when the patrons of the Stonewall Inn, a gay bar in Greenwich Village, rioted after a police raid. In the aftermath of that event, gay and lesbian groups began to organize around the country. Gay Democratic clubs were created in every major city, and one fourth of all college campuses had gay and lesbian groups (Shilts, 1993, ch.28). Large gay urban communities in cities from coast to coast became the norm. The American Psychiatric Association removed homosexuality from its official listing of mental disorders. The increased visibility of gays and lesbians has become a permanent feature of American life despite the two critical setbacks of the AIDS epidemic and an anti-gay backlash (see Berman, 1993, for a good survey). The post-Stonewall era has also seen marked changes in Western Europe, where the repeal of anti-sodomy laws and legal equality for gays and lesbians has become common.

Natural Law

Today natural law theory offers the most common intellectual defense for differential treatment of gays and lesbians, and as such it merits attention. The development of natural law is a long and very complicated story, but a reasonable place to begin is with the dialogues of Plato, for this is where some of the central ideas are first articulated, and, significantly enough, are immediately applied to the sexual domain. For the Sophists, the human world is a realm of convention and change, rather than of unchanging moral truth. Plato, in contrast, argued that unchanging truths underpin the flux of the material world. Reality, including eternal moral truths, is a matter of *phusis*. Even though there is clearly a great degree of variety in conventions from one city to another (something ancient Greeks became increasingly aware of), there is still an unwritten standard, or law, that humans should live under.

In the *Laws*, Plato applies the idea of a fixed, natural law to sex, and takes a much harsher line than he does in the *Symposium* or the *Phraedrus*. In Book One he writes about how opposite-sex sex acts cause pleasure by nature, while same-sex sexuality is "unnatural" (636c). In Book Eight, the Athenian speaker considers how to have legislation banning homosexual acts, masturbation, and illegitimate procreative sex widely accepted. He then states that this law is according to nature (838-839d). Probably the best way of understanding Plato's discussion here is in the context of his overall concerns with the appetitive part of the soul and how best to control it. Plato clearly sees same-sex passions as especially strong, and hence particularly problematic, although in the *Symposium* that erotic attraction could be the catalyst for

a life of philosophy, rather than base sensuality (Cf. Dover, 1989, 153-170; Nussbaum, 1999, esp. chapter 12).

Other figures played important roles in the development of natural law theory. Aristotle, with his emphasis upon reason as the distinctive human function, and the Stoics, with their emphasis upon human beings as a part of the natural order of the cosmos, both helped to shape the natural law perspective which says that “True law is right reason in agreement with nature,” as Cicero put it. Aristotle, in his approach, did allow for change to occur according to nature, and therefore the way that natural law is embodied could itself change with time, which was an idea Aquinas later incorporated into his own natural law theory. Aristotle did not write extensively about sexual issues, since he was less concerned with the appetites than Plato. Probably the best reconstruction of his views places him in mainstream Greek society as outlined above; the main issue is that of active versus a passive role, with only the latter problematic for those who either are or will become citizens. Zeno, the founder of Stoicism, was, according to his contemporaries, only attracted to men, and his thought had no prohibitions against same-sex sexuality. In contrast, Cicero, a later Stoic, was dismissive about sexuality in general, with some harsher remarks towards same-sex pursuits (Cicero, 1966, 407-415).

The most influential formulation of natural law theory was made by Thomas Aquinas in the thirteenth century. Integrating an Aristotelian approach with Christian theology, Aquinas emphasized the centrality of certain human goods, including marriage and procreation. While Aquinas did not write much about same-sex sexual relations, he did write at length about various sex acts as sins. For Aquinas, sexuality that was within the bounds of marriage *and* which helped to further what he saw as the distinctive goods of marriage, mainly love, companionship, and legitimate offspring, was permissible, and even good. Aquinas did not argue that procreation was a necessary part of moral or just sex; married couples could enjoy sex without the motive of having children, and sex in marriages where one or both partners is sterile (perhaps because the woman is postmenopausal) is also potentially just (given a motive of expressing love). So far Aquinas' view actually need not rule out homosexual sex. For example, a Thomist could embrace same-sex marriage, and then apply the same reasoning, simply seeing the couple as a reproductively sterile, yet still fully loving and companionate union.

Aquinas, in a significant move, adds a requirement that for any given sex act to be moral it must be of a generative kind. The only way that this can be achieved is via vaginal intercourse. That is, since only the emission of semen in a vagina can result in natural reproduction, only sex acts of that type are generative, even if a given sex act does not lead to reproduction, and even if it is impossible due to infertility. The consequence of this addition is to rule out the possibility, of course, that homosexual sex could ever be moral (even if done within a loving marriage), in addition to forbidding any non-vaginal sex for opposite-sex married couples. What is the justification for this important addition? This question is made all the more pressing in that Aquinas does allow that how broad moral rules apply to individuals may vary considerably, since the nature of persons also varies to some extent. That is, since Aquinas allows that individual natures vary, one could simply argue that one is, by nature, emotionally and physically attracted to persons of one's own gender, and hence to pursue same-sex relationships is ‘natural’ (Sullivan, 1995). Unfortunately, Aquinas does not spell out a justification for this generative requirement.

More recent natural law theorists, however, have tried a couple different lines of defense for Aquinas' ‘generative type’ requirement. The first is that sex acts that involve either homosexuality, heterosexual sodomy, or which use contraception, frustrate the purpose of the sex organs, which is reproductive. This argument, often called the ‘perverted faculty argument’, is perhaps implicit in Aquinas. It has, however, come in for sharp attack (see Weitham, 1997), and the best recent defenders of a Thomistic natural law approach are attempting to move beyond it (e.g., George, 1999, dismisses the argument). If their arguments fail, of course, they must allow that some homosexual sex acts are morally permissible (even positively good), although they would still have resources with which to argue against casual gay (and straight) sex.

Although the specifics of the second sort of argument offered by various contemporary natural law theorists vary, the common elements are strong (Finnis, 1994; George, 1999). As Thomists, their argument rests largely upon an account of human goods. The two most important for the argument against homosexual sex (though not against homosexuality as an orientation which is not acted upon, and hence in this they follow official Catholic doctrine; see George, 1999, ch.15) are personal integration and marriage. Personal integration, in this view, is the idea that humans, as agents, need to have integration between their intentions as agents and their embodied selves. Thus, to use one's or another's body as a mere means to one's own pleasure, as they argue happens with masturbation, causes ‘dis-integration’ of the self. That is, one's intention then is just to use a body (one's own or another's) as a mere means to the end of pleasure, and this detracts from personal integration. Yet one could easily reply that two persons of the same sex engaging in sexual union does not necessarily imply any sort of ‘use’ of the other as a mere means to one's own pleasure. Hence, natural law theorists respond that sexual union in the context of the realization of marriage as an important human good is the only permissible expression of sexuality. Yet this argument requires drawing how marriage is an important good in a very particular way, since it puts procreation at the center of marriage as its “natural fulfillment” (George, 1999, 168). Natural law theorists, if they want to support their objection to homosexual sex, have to emphasize procreation. If, for example, they were to place love and mutual support for human flourishing at the center, it is clear that many same-sex couples would meet this standard. Hence their sexual acts would be morally just.

There are, however, several objections that are made against this account of marriage as a central human good. One is that by placing procreation as the ‘natural fulfillment’ of marriage, sterile marriages are thereby denigrated. Sex in an opposite-sex marriage where the partners know that one or both of them are sterile is not done for procreation. Yet surely it is not wrong. Why, then, is homosexual sex in the same context (a long-term companionate union) wrong (Macedo, 1995)? The natural law rejoinder is that while vaginal intercourse is a potentially procreative sex act, considered in itself (though admitting the possibility that it may be impossible for a particular couple), oral and anal sex acts are never potentially procreative, whether heterosexual or homosexual (George, 1999). But is this biological distinction also morally relevant, and in the manner that natural law theorists assume? Natural law theorists, in their discussions of these issues, seem to waver. On the one hand, they want to defend an ideal of marriage as a loving union wherein two persons are committed to their mutual flourishing, and where sex is a complement to that ideal. Yet that opens the possibility of permissible gay sex, or heterosexual sodomy, both of which they want to oppose. So they then defend an account of sexuality which seems crudely

reductive, emphasizing procreation to the point where literally a male orgasm anywhere except in the vagina of one's loving spouse is impermissible. Then, when accused of being reductive, they move back to the broader ideal of marriage.

Natural law theory, at present, has made significant concessions to mainstream liberal thought. In contrast certainly to its medieval formulation, most contemporary natural law theorists argue for limited governmental power, and do not believe that the state has an interest in attempting to prevent all moral wrongdoing. Still, they do argue against homosexuality, and against legal protections for gays and lesbians in terms of employment and housing, even to the point of serving as expert witnesses in court cases or helping in the writing of *amicus curae* briefs. They also argue against same sex marriage (Bradley, 2001; George, 2001).

Queer Theory and the Social Construction of Sexuality

With the rise of the gay liberation movement in the post-Stonewall era, overtly gay and lesbian perspectives began to be put forward in politics, philosophy and literary theory. Initially these often were overtly linked to feminist analyses of patriarchy (e.g., Rich, 1980) or other, earlier approaches to theory. Yet in the late 1980's and early 1990's queer theory was developed, although there are obviously important antecedents which make it difficult to date it precisely. There are a number of ways in which queer theory differed from earlier gay liberation theory, but an important initial difference can be gotten at by examining the reasons for opting for the term ‘queer’ as opposed to ‘gay and lesbian.’ Some versions of, for example, lesbian theory portrayed the essence of lesbian identity and sexuality in very specific terms: non-hierarchical, consensual, and, specifically in terms of sexuality, as not necessarily focused upon genitalia (e.g., Faderman, 1985). Lesbians arguing from this framework, for example, could very well criticize natural law theorists as inscribing into the very “law of nature” an essentially masculine sexuality, focused upon the genitals, penetration, and the status of the male orgasm (natural law theorists never mention female orgasms).

This approach, based upon characterizations of ‘lesbian’ and ‘gay’ identity and sexuality, however, suffered from three difficulties. First, it appeared even though the goal was to critique a heterosexist regime for its exclusion and marginalization of those whose sexuality is different, any specific or “essentialist” account of gay or lesbian sexuality had the same effect. Sticking with the example used above, of a specific conceptualization of lesbian identity, it denigrates women who are sexually and emotionally attracted to other women, yet who do not fit the description. Sado-masochists and butch/fem lesbians arguably do not fit this ideal of ‘equality’ offered. A second problem was that by placing such an emphasis upon the gender of one's sexual partner(s), other possible important sources of identity are marginalized, such as race and ethnicity. What is of utmost importance, for example, for a black lesbian is her lesbianism, rather than her race. Many gays and lesbians of color attacked this approach, accusing it of re-inscribing an essentially white identity into the heart of gay or lesbian identity (Jagose, 1996).

The third and final problem for the gay liberationist approach was that it often took this category of ‘identity’ itself as unproblematic and unhistorical. Such a view, however, largely because of arguments developed within poststructuralism, seemed increasingly untenable. The key figure in the attack upon identity as an ahistorical thing is Michel Foucault. In a series of works he set out to analyze the history of sexuality from ancient Greece to the modern era (1980, 1985, 1986). Although the project was tragically cut short by his death in 1984, from complications arising from AIDS, Foucault articulated how profoundly understandings of sexuality can vary across time and space, and his arguments have proven very influential in gay and lesbian theorizing in general, and queer theory in particular (Spargo, 1999).

One of the reasons for the historical review above is that it helps to give some background for understanding the claim that sexuality is socially constructed, rather than given by nature. Moreover, in order to not prejudge the issue of social constructionism versus essentialism, I avoided applying the term ‘homosexual’ to the ancient or medieval eras. In ancient Greece the gender of one's partner(s) was not important, but instead whether one took the active or passive role. In the medieval view, a ‘sodomite’ was a person who succumbed to temptation and engaged in certain non-procreative sex acts. Although the gender of the partner was more important than in the ancient view, the broader theological framework placed the emphasis upon a sin versus refraining-from-sin dichotomy. With the rise of the notion of ‘homosexuality’ in the modern era, a person is placed into a specific category even if one does not act upon those inclinations. What is the common, natural sexuality expressed across these three very different cultures? The social constructionist answer is that there is no ‘natural’ sexuality; all sexual understandings are constructed within and mediated by cultural understandings. The examples can be pushed much further by incorporating anthropological data outside of the Western tradition (Halperin, 1990; Greenberg, 1988). Yet even within the narrower context offered here, the differences between them are striking. The assumption in ancient Greece is that men (less is known about women) can respond erotically to either sex, and the vast majority of men who engaged in same-sex relationships were also married (or would later become married). Yet the contemporary understanding of homosexuality divides the sexual domain in two, heterosexual and homosexual, and most heterosexuals cannot respond erotically to their own sex.

In saying that sexuality is a social construct, these theorists are not saying that these understandings are not real. Since persons are also constructs of their culture (in this view), we are made into those categories. Hence today persons of course understand themselves as straight or gay (or perhaps bisexual), and it is very difficult to step outside of these categories, even once one comes to seem them as the historical constructs they are.

Gay and lesbian theory was thus faced with three significant problems, all of which involved difficulties with the notion of ‘identity.’ Queer theory thus arose in large part as an attempt to overcome them. How queer theory does so can be seen by looking at the term ‘queer’ itself. In contrast to gay or lesbian, ‘queer,’ it is argued, does not refer to an essence, whether of a sexual nature or not. Instead it is purely relational, standing as an undefined term that gets its meaning precisely by being that which is outside of the norm, however that norm itself may be defined. As one of the most articulate queer theorists puts it: “Queer is … *whatever* is at odds with the normal, the legitimate, the dominant. *There is nothing in particular to which it necessarily refers*. It is an identity without an essence” (Halperin, 1995, 62,

original emphasis). By lacking any essence, queer does not marginalize those whose sexuality is outside of any gay or lesbian norm, such as sado-masochists. Since specific conceptualizations of sexuality are avoided, and hence not put at the center of any definition of queer, it allows more freedom for self-identification for, say, black lesbians to identify as much or more with their race (or any other trait, such as involvement in an S & M subculture) than with lesbianism. Finally, it incorporates the insights of poststructuralism about the difficulties in ascribing any essence or non-historical aspect to identity.

This central move by queer theorists, the claim that the categories through which identity is understood are all social constructs rather than given to us by nature, opens up a number of analytical possibilities. For example, queer theorists examine how fundamental notions of gender and sex which seem so natural and self-evident to persons in the modern West are in fact constructed and reinforced through everyday actions, and that this occurs in ways that privilege heterosexuality (Butler, 1990, 1993). Also examined are medical categories which are themselves socially constructed (Fausto-Sterling, 2000, is an erudite example of this, although she is not ultimately a queer theorist). Others examine how language and especially divisions between what is said and what is not said, corresponding to the dichotomy between ‘closeted’ and ‘out,’ especially in regards to the modern division of heterosexual/homosexual, structure much of modern thought. That is, it is argued that when we look at dichotomies such as natural/artificial, or masculine/feminine, we find in the background an implicit reliance upon a very recent, and arbitrary, understanding of the sexual world as split into two species (Sedgwick, 1990).

Another critical perspective opened up by a queer approach, although certainly implicit in those just referred to, is especially important. Since most anti-gay and lesbian arguments rely upon the alleged naturalness of heterosexuality, queer theorists attempt to show how these categories are themselves deeply social constructs. An example helps to illustrate the approach. In an essay against gay marriage, chosen because it is very representative, James Q. Wilson (1996) contends that gay men have a “great tendency” to be promiscuous. In contrast, he puts forward loving, monogamous marriage as the natural condition of heterosexuality. Heterosexuality, in his argument, is an odd combination of something completely natural yet simultaneously endangered. One is born straight, yet this natural condition can be subverted by such things as the presence of gay couples, gay teachers, or even excessive talk about homosexuality. Wilson's argument requires a radical disjunction between heterosexuality and homosexuality. If gayness is radically different, it is legitimate to suppress it. Wilson has the courage to be forthright about this element of his argument; he comes out against “the political imposition of tolerance” towards gays and lesbians (Wilson, 1996, 35).

It is a common move in queer theory to bracket, at least temporarily, issues of truth and falsity (Halperin, 1995). Instead, the analysis focuses upon the social function of discourse. Questions of who counts as an expert and why, and concerns about the effects of the expert's discourse are given equal status to questions of the verity of what is said. This approach reveals that hidden underneath Wilson's (and other anti-gay) work is an important epistemological move. Since heterosexuality is the natural condition, it is a place that is spoken from but not inquired into. In contrast, homosexuality is the aberration and hence it needs to be studied but it is not an authoritative place from which one can speak. By virtue of this heterosexual privilege, Wilson is allowed the voice of the impartial, fair-minded expert. Yet, as the history section above shows, there are striking discontinuities in understandings of sexuality, and this is

true to the point that, according to queer theorists, we should not think of sexuality as having any particular nature at all. Through undoing our infatuation with any specific conception of sexuality, the queer theorist opens space for marginalized forms.

Queer theory, however, has been criticized in a myriad of ways (Jagose, 1996). One set of criticisms comes from theorists who are sympathetic to gay liberation conceived as a project of radical social change. An initial criticism is that precisely because ‘queer’ does not refer to any specific sexual status or gender object choice, for example Halperin (1995) allows that straight persons may be ‘queer,’ it robs gays and lesbians of the distinctiveness of what makes them marginal. It desexualizes identity, when the issue is precisely about a sexual identity (Jagose, 1996). A related criticism is that queer theory, since it refuses any essence or reference to standard ideas of normality, cannot make crucial distinctions. For example, queer theorists usually argue that one of the advantages of the term ‘queer’ is that it thereby includes transsexuals, sado-masochists, and other marginalized sexualities. How far does this extend? Is transgenerational sex (e.g., pedophilia) permissible? Are there any limits upon the forms of acceptable sado-masochism or fetishism? While some queer theorists specifically disallow pedophilia, it is an open question whether the theory has the resources to support such a distinction. Furthermore, some queer theorists overtly refuse to rule out pedophiles as ‘queer’ (Halperin, 1995, 62) Another criticism is that queer theory, in part because it typically has recourse to a very technical jargon, is written by a narrow elite for that narrow elite. It is therefore class biased and also, in practice, only really referred to at universities and colleges (Malinowitz, 1993).

Queer theory is also criticized by those who reject the desirability of radical social change. For example, centrist and conservative gays and lesbians have criticized a queer approach by arguing that it will be “disastrously counter-productive” (Bawer, 1996, xii). If ‘queer’ keeps its connotation of something perverse and at odds with mainstream society, which is precisely what most queer theorists want, it would seem to only validate the attacks upon gays and lesbians made by conservatives. Sullivan (1996) also criticizes queer theorists for relying upon Foucault's account of power, which he argues does not allow for meaningful resistance. It seems likely, however, that Sullivan's understanding of Foucault's notions of power and resistance are misguided.

Conclusion

The debates about homosexuality, in part because they often involve public policy and legal issues, tend to be sharply polarized. Those most concerned with homosexuality, positively or negatively, are also those most engaged, with natural law theorists arguing for gays and lesbians having a reduced legal status, and queer theorists engaged in critique and deconstruction of what they see as a heterosexist regime. Yet the two do not talk much to one another, but rather ignore or talk past one another. There are some theorists in the middle. For example, Michael Sandel takes an Aristotelian approach from which he argues that gay and lesbian relationships can realize the same goods that heterosexual relationships do (Sandel, 1995). He largely shares the account of important human goods that natural law theorists have, yet in his evaluation of the worth of same-sex relationships, he is clearly sympathetic to gay and lesbian concerns. Similarly, Bruce Bawer (1993) and Andrew Sullivan (1995) have written eloquent defenses of

full legal equality for gays and lesbians, including marriage rights. Yet neither argue for any systematic reform of broader American culture or politics. In this they are essentially conservative. Therefore, rather unsurprisingly, these centrists are attacked from both sides. Sullivan, for example, has been criticized at length both by queer theorists (e.g., Phelan, 2001) and natural law theorists (e.g., George, 1999).

Yet as the foregoing also clearly shows, the policy and legal debates surrounding homosexuality involve fundamental issues of morality and justice. Perhaps most centrally of all, they cut to issues of personal identity and self-definition. Hence there is another, and even deeper, set of reasons for the polarization that marks these debates.

Pyrrho

Pyrrho was the starting-point for a philosophical movement known as Pyrrhonism that flourished several centuries after his own time. This later Pyrrhonism was one of the two major traditions of sceptical thought in the Greco-Roman world (the other being located in Plato's Academy during much of the Hellenistic period). Perhaps the central question about Pyrrho is whether or to what extent he himself was a sceptic in the later Pyrrhonist mold. The later Pyrrhonists claimed inspiration from him; and, as we shall see, there is undeniably some basis for this. But it does not follow that Pyrrho's philosophy was identical to that of this later movement, or even that the later Pyrrhonists thought that it was identical; the claims of indebtedness that are expressed by or attributed to members of the later Pyrrhonist tradition are broad and general in character (and in Sextus Empiricus' case notably cautious -- see *Outlines of Pyrrhonism* 1.7), and do not in themselves point to any particular reconstruction of Pyrrho's thought. It is necessary, therefore, to focus on the meager evidence bearing explicitly upon Pyrrho's own ideas and attitudes. How we read this evidence will also, of course, affect our conception of Pyrrho's relations with his philosophical contemporaries and predecessors.

1. Life

Pyrrho appears to have lived from around 365-360 BC until around 275-270 BC (for the evidence see von Fritz (1963), 90). We have several reports of philosophers from whom he learned, the most significant

(and the most reliable) of which concern his association with Anaxarchus of Abdera. Alongside Anaxarchus (and several other philosophers) he accompanied Alexander the Great on his expedition to India. We are told that in the course of this expedition he encountered some “naked wise men” (*gumnosophistai*); Diogenes Laertius (9.61) claims that his philosophy developed as a result of this meeting, but it is not clear what basis, if any, he has for this assertion. In any case, after his return to Greece Pyrrho did espouse a philosophy that attracted numerous followers, of whom the most important was Timon of Phlius. The travel writer Pausanias reports (6.24.5) seeing a statue of him in the marketplace in Pyrrho's home town of Elis; Diogenes also reports (9.64) that he was made high priest, and that in his honor philosophers were made exempt from city taxation. While Pausanias' report is easier to accept at face value than Diogenes', both suggest that (at least locally) he achieved considerable celebrity. However, there is no good reason to believe that a Pyrrhonist ‘movement’ continued beyond his own immediate followers; it was not until the first century BC that Pyrrhonism became the name of an ongoing philosophical tradition.

2. The Nature of the Evidence

With the possible exception of a poem honoring Alexander, Pyrrho wrote nothing; we are therefore obliged to try to reconstruct his philosophy from reports by others. Unfortunately the reports that we have are fragmentary and, in many cases, of doubtful reliability. Pyrrho's follower Timon wrote numerous poems and prose works; but of these only fragments and in some cases second-hand reports survive. It is likely that much of what we hear about Pyrrho in later sources also derives indirectly from Timon, but it is frequently not possible to judge, in individual cases, whether or not this is so. Other difficulties concerning Timon's evidence are, first, that he writes as a devotee rather than as a neutral reporter, and second, that the great majority of Timon's fragments derive from a poem called *Silloi* (*Lampoons*), and consist of satirical thumbnail sketches of other philosophers rather than any kind of direct exposition of Pyrrho's outlook. Nevertheless, Timon is clearly the most important and the most trustworthy source of information about Pyrrho. Of the evidence from Timon, one piece is especially important. This is a summary, by the Peripatetic Aristocles of Messene (late 1st c. BC), of an account by Timon of Pyrrho's most general philosophical attitudes; it is generally agreed that this passage must be the centerpiece of any interpretation of Pyrrho's philosophy.

With the exception of a very few snippets of information, the only other source of evidence on Pyrrho that is close to contemporary is Antigonus of Carystus, a biographer of the mid-third century BC. Diogenes Laertius, whose life of Pyrrho is our major source of biographical anecdotes, frequently cites Antigonus, and is probably indebted to him in many places even when he does not cite him; Antigonus is also mentioned by Aristocles, and is likely to be the origin of much or even most of the surviving biographical material on Pyrrho. But Antigonus needs to be handled even more carefully than Timon. He was not a philosopher, and there is no reason to think that he was capable of or particularly interested in comprehending philosophical nuances. Nor is it clear that accuracy was high on his list of priorities; on the contrary, what we know about him suggests that he was a purveyor of sensationalist gossip rather than a reliable historian. His account probably did contain genuine information about Pyrrho's demeanor and activities; but it would certainly be unwise to take his anecdotes as a group on trust.

Cicero refers to Pyrrho about ten times, and Cicero is, in general, a responsible reporter of other people's views. Unfortunately his information about Pyrrho appears to be very incomplete, and, as we shall see, the impression he conveys of him may very well be inaccurate. With one exception, he never mentions him except in conjunction with the Stoics Aristo and (sometimes) Herillus, and the remarks in question always concern the same one or two points in ethics; it looks as if his knowledge of Pyrrho derives almost entirely from a single source that conveyed little or nothing about Pyrrho individually, and nothing at all about any views of his in metaphysics or epistemology. In addition, a number of authors in later antiquity make isolated comments about Pyrrho. But since these comments postdate the rise of the later Pyrrhonist movement, there is often room for suspicion as to whether they reflect genuine information about Pyrrho himself, as opposed to the later philosophy that took his name.

The safest way to proceed, then, in attempting to interpret Pyrrho's philosophy, is to begin with a detailed analysis of the summary of Timon in Aristocles; the remaining evidence should be interpreted, and assessed for its trustworthiness, as far as possible in light of what the Aristocles passage has to tell us about Pyrrho's philosophy.

3. The Aristocles Passage

The main burden of the previous section is uncontroversial. By contrast, the interpretation of the Aristocles passage itself is fraught with controversy. Given the admitted centrality of this passage in any interpretation of Pyrrho, it follows that the character of Pyrrho's thinking is, at its very core, a matter for sharp disagreement. The present survey will attempt to lay out the two main alternatives and explore the consequences of each.

A word, first, about the provenance and evidential value of the passage. Several chapters from book 8 of Aristocles' *Peri philosophias* (*On Philosophy*) appear in quotation in the *Praeparatio evangelica* of Eusebius, the fourth-century bishop of Caesarea. These chapters expound, and then attack from an Aristotelian perspective, a number of philosophies that impugn the reliability of one or other of our cognitive faculties. Among these Aristocles counts Pyrrhonism, as represented by Pyrrho himself and by the initiator of the later Pyrrhonist tradition, Aenesidemus; Aristocles speaks of Aenesidemus as recent, and is apparently not aware of any subsequent members of the Pyrrhonist tradition. The chapter on Pyrrhonism opens with a brief summary of the outlook of Pyrrho specifically, as reported by Timon (14.18.1-5).

This convoluted transmission might lead one to doubt how much authentic information can be extracted from the passage. But there is no reason, first, to doubt Eusebius' explicit claim to be quoting Aristocles verbatim. Aristocles is not quoting Timon verbatim; some of the vocabulary in this passage is clearly reminiscent of Aristocles' own vocabulary in other chapters. However, other terms in the passage are quite distinct both from Aristocles' own normal usage and from any of the terminology familiar to us from later Pyrrhonism, yet were in use prior to Timon's day; it seems easiest to account for these as authentic reproductions of Timon's own language. In addition, the frequent mention of Timon either by

name or by the word *phêsi*, ‘he says’, suggests that Aristocles is taking pains to reproduce the essentials of his account as faithfully as possible. And finally, Aristocles' other chapters, where we are in a position to check his summaries against other evidence of the views being summarized, suggest that he is in general a reliable reporter of other people's views, even views to which he himself is strongly opposed -- or at least, that he is reliable when he has access to systematic written expositions of those views, as seems to be the case here. As for Timon's reliability as a source for Pyrrho's views, a word was said about this in the previous section; this passage stands out from most of the surviving record from Timon in that it appears to be based on a systematic account of the central points of Pyrrho's outlook. Thus, while we clearly cannot be sure that every detail of the passage accurately reflects something that Pyrrho thought, all the indications are that the passage deserves to be taken seriously as evidence for Pyrrho's philosophy.

Timon is reported as telling us that in order to be happy, one must pay attention to three connected questions: first, what are things like by nature? second, how should we be disposed towards things (given our answer to the first question)? and third, what will be the outcome for those who adopt the disposition recommended in the answer to the second question? And the passage then gives us Pyrrho's and Timon's answers to each of the three questions in order.

The answer to the question “what are things like by nature?” is given by a sequence of three epithets; things are said to be *adiaphora* and *astathmêta* and *anepikrita*. Taken by themselves, these epithets can be understood in two importantly different ways: they may be taken as characterizing how things are (by nature) in themselves, or they may be taken as commenting on human beings' lack (by our nature) of cognitive access to things. *Adiaphora* is normally translated ‘indifferent’. But this might be taken as referring either to an intrinsic characteristic of things -- namely that, in themselves and by nature, they possess no differentiating features -- or to our natural inability to discern any such features. (In the latter case ‘undifferentiable’ might be a more perspicuous translation.) Similarly, *astathmêta* might mean ‘unstable’ or ‘unbalanced’, describing an objective property of things; or it might mean ‘not subject to being placed on a balance’, and hence ‘unmeasurable’, which would again place the focus on our cognitive inabilities. And *anepikrita* might mean ‘indeterminate’, referring to an objective lack of any definite features, or ‘indeterminable’, pointing to an inability on our part to determine the features of things. The statement as a whole, then, is either answering the question “what are things like by nature?” by stating that things are, in their very nature, indefinite or indeterminate in various ways -- the precise nature of the thesis would be a matter for further speculation -- or by stating that we human beings are not in a position to pin down or determine the nature of things. Let us call these the metaphysical and the epistemological interpretations respectively.

It is clear that the metaphysical interpretation gives us a Pyrrho who is not in any recognizable sense a sceptic. Pyrrho, on this interpretation, is issuing a declaration about the nature of things in themselves -- precisely what the later Pyrrhonists who called themselves sceptics were careful to avoid. On the epistemological interpretation, on the other hand, Pyrrho is very much closer to the tradition that took his name. There is still some distance between them. To say that we *cannot* determine the nature of things -- as opposed to saying that we have so far failed to determine the natural features of things -- is already a departure from the sceptical suspension of judgement promoted by Sextus Empiricus. And to put it, as on this reading Pyrrho does put it, by saying that *things* are indeterminable, is a further departure, in that it

does attribute at least one feature to things in themselves -- namely, being such that humans cannot determine them. Nevertheless, the epistemological interpretation clearly portrays Pyrrho as a forerunner -- a naive and unsophisticated forerunner, perhaps -- of later Pyrrhonist scepticism, whereas the metaphysical interpretation puts him in a substantially different light.

The natural way to try to choose between these two interpretations is to see which of them fits best with the logic of the passage as a whole. But here we encounter a further complication. The text of the phrase that follows the words we have just been discussing is subject to dispute. According to the manuscripts this phrase reads “*for this reason* (*dia touto*) neither our sensations nor our opinions tell the truth or lie”. Now, if this reading is correct, the thought expressed seems to favor the metaphysical interpretation; the idea is that, since things are in their real nature indeterminate, our sensations and opinions, which represent things as having certain determinate features, are neither true nor false. They are not true, since reality is not the way they present it as being; but they are not false either, since that too would require that reality have certain determinate features, namely features that are the negations of the ones that our sensations and opinions portray it as having. By contrast, it is quite unclear how the claim that the nature of things cannot be determined by us could be thought to license the inference “for this reason neither our sensations nor our opinions tell the truth or lie”. That claim would seem at most to license the very different inference that *we* cannot tell whether they tell the truth or lie.

But some scholars have suggested that the manuscripts are in error at this point, and that what the text should say is “*on account of the fact that* (*dia to*) neither our sensations nor our opinions tell the truth or lie”. The change is justified on linguistic grounds; it is alleged that the text in the manuscripts as they stand is not acceptable Greek. The considerations for and against this proposal are technical, and debate has yielded no consensus on this question. However, it is clear that if one does make this small alteration to the text, the direction of the inference is reversed; the point about our sensations and opinions now becomes a reason for the point about the nature of things, not an inference from it. And this, it has been argued, points towards the epistemological interpretation. The idea would then be that, since our sensations and opinions fail to be consistent deliverers of true reports (or, for that matter, false reports) about the world around us, there is no prospect of our being able to determine the nature of things.

This is the crux on which the decision between the two main lines of interpretation of Pyrrho's philosophy turns. The remainder of the Aristocles passage, and indeed the remainder of the evidence on Pyrrho in general, can be read so as to fit with either the metaphysical or the epistemological reading of his answer to the question about the nature of things. The Aristocles passage continues with the answer to the second question, namely the question of the attitude we should adopt given the answer to the first question. We are told, first, that we should not trust our sensations and opinions, but should adopt an unopinionated attitude. On the epistemological reading, the significance of this is obvious. But on the metaphysical reading, too, we have already been told that our sensations and opinions are not true, which is presumably reason enough for us not to trust them; and the unopinionated attitude that is here recommended may be understood as one in which one refrains from positing any definite characteristics as inherent in the nature of things -- given that their real nature is wholly indefinite. (To the objection that this thesis of indefiniteness is itself an opinion, it may be replied that *doxa*, ‘opinion’, is regularly used in earlier Greek philosophy, especially in Parmenides and Plato, to refer to those opinions -- misguided opinions, in the

view of these authors -- that take on trust a view of the world as conforming more or less to the way it appears in ordinary experience. In this usage, the claim that reality is indefinite would not be a (mere) opinion, but would be a statement of the truth.)

The passage now introduces a certain form of speech that is supposed to reflect this unopinionated attitude. We are supposed to say "about each single thing that it no more is than is not or both is and is not or neither is nor is not". There are a number of intricate questions about the exact relations between the various parts of this complicated utterance, and especially about the role and significance of the 'both' and 'neither' components. But it is clear that this too is susceptible of being read along the lines of either of the two interpretations introduced above. On the metaphysical interpretation, we are being asked to adopt a form of words that reflects the utter indefiniteness of the way things are; we should not say of anything that it *is* any particular way any more than that it is *not* that way (with 'is' being understood, as commonly in Greek philosophy, as shorthand for 'is *F*', where *F* stands for any arbitrary predicate). On the epistemological interpretation, we are being asked to use a manner of speaking that expresses our suspension of judgement about how things are. Sextus Empiricus specifically tells us that 'no more' (*ou mallon*) is a term used by the sceptics to express suspension of judgement, and its occurrence in the Aristocles passage can be taken as an early example of the same type of usage.

Finally, in answer to the third question, we are told that the result for those who adopt the unopinionated attitude just recommended is first *aphasia* and then *ataraxia*. *Ataraxia*, 'freedom from worry', is familiar to us from later Pyrrhonism; this is said by the later Pyrrhonists to be the result of the suspension of judgement that they claimed to be able to induce. The precise sense of *aphasia* is less clear. It might mean 'non-assertion', as in Sextus -- that is, a refusal to commit oneself to definite alternatives; or it might mean, more literally, 'speechlessness', which could in turn be taken to be an initial reaction of stunned silence to the radical position with which one has been presented (an uncomfortable reaction that is subsequently replaced by *ataraxia* -- the passage does say that *aphasia* comes first and *ataraxia* comes later). But the decision between these two ways of understanding the term is independent of the broader interpretive issues bearing upon the passage as a whole. For some form of 'non-assertion' is clearly licensed by either the metaphysical or the epistemological interpretation; and on either interpretation, the view proposed might indeed render someone (initially) uncomfortable to the point of 'speechlessness'. The important point, though, is that *ataraxia* is the end result; and this links back to the introductory remark to the effect that the train of thought to be summarized has the effect of making one happy.

We have, then, two major possibilities. On the one hand, Pyrrho can be read as advancing a sweeping metaphysical thesis, that things are in their real nature indefinite or indeterminate, and encouraging us to embrace the consequences of that thesis by refusing to attribute any definite features to things (at least, as belonging to their real nature) and by refusing to accept at face value (again, as revelatory of the real nature of things) those myriad aspects of our ordinary experience that represent things as having certain definite features. Or, on the other hand, Pyrrho can be read as declaring that the nature of things is inaccessible to us, and encouraging us to withdraw our trust (and to speak in such a way as to express our withdrawal of trust) in ordinary experience as a guide to the nature of things. As noted earlier, the second, epistemological interpretation makes Pyrrho's outlook a great deal closer to that of the later Pyrrhonists who took him as an inspiration. But that is not in itself any reason for favoring this interpretation over the

other, metaphysical one. For on either interpretation Pyrrho is said to promise *ataraxia*, the later Pyrrhonists' goal, and to promise it as a *result* of a certain kind of withdrawal of trust in the veracity of our everyday impressions of things; the connection between these two points aligns Pyrrho with the later Pyrrhonists, and sets him apart from every other Greek philosophical movement that preceded later Pyrrhonism. The fact that this later sceptical tradition took Pyrrho as an inspiration is therefore readily understandable whichever of the two interpretations is correct (or whichever they thought was correct). It is also true that, on the metaphysical interpretation of the passage, the grounds on which Pyrrho advanced his metaphysical thesis of indeterminacy are never specified; this too, like the precise character of the thesis itself, must be a matter for speculative reconstruction. But Aristocles only purports to be giving the key points of Timon's summary; the lack of detail, though disappointing, would not be surprising.

4. Other Reports on Pyrrho's General Approach

The other evidence bearing upon Pyrrho's central philosophical attitudes does nothing to settle the dispute between these two possible interpretations of the Aristocles passage. A number of texts explicitly or implicitly represent Pyrrho's outlook as essentially identical to the sceptical outlook of the later Pyrrhonists. However, all of these texts postdate the rise of later Pyrrhonism itself, and none of them contains anything like the level of detail of the Aristocles passage; there is no particular reason to suppose that any of them represents a genuine understanding of Pyrrho as distinct from the later Pyrrhonists. There are also a few texts that appear to offer a picture of Pyrrho's thought that is congenial to the metaphysical interpretation. The most significant of these is a passage from near the beginning of Diogenes Laertius' life of Pyrrho (9.61); Pyrrho, we are told, “said that nothing is either fine or ignoble or just or unjust; and similarly in all cases that nothing is the case in reality (*mêden einai têi alêtheiai*), but that human beings do everything by convention and habit; for each thing is no more this than that”. This looks as if it is attributing to Pyrrho a metaphysical thesis, and a thesis according to which things have no definite features; it does not seem to be portraying Pyrrho as an advocate of suspension of judgement. However, the passage is undoubtedly in some way confused. For immediately beforehand we are told that Pyrrho was the one who initiated the type of philosophy consisting of “inapprehensibility and suspension of judgement”; and the previously quoted passage is then cited as confirmation of this. This passage of Diogenes as a whole, then, fails to maintain any clear distinction between epistemological and metaphysical readings of Pyrrho's thought, and cannot safely be used as evidence for either.

5. Reports on Pyrrho's Demeanor and Lifestyle

Most of the remaining evidence about Pyrrho has to do with his practical attitudes and behavior. There are a number of biographical anecdotes, and there are a few fragments of Timon that purport to depict Pyrrho's state of mind. Some of the biographical anecdotes are clearly polemical inventions. For example, Diogenes (9.62) reports Antigonus as saying that Pyrrho's lack of trust in his senses led him to ignore precipices, oncoming wagons and dangerous dogs, and that his friends had to follow him around to protect him from these various everyday hazards. But he then reports the dissenting verdict of Aenesidemus, according to which Pyrrho was perfectly capable of conducting himself in a sensible

manner. This reflects a longstanding ancient dispute as to whether it is possible to live if one radically abandons common-sense attitudes to the world (as, on either of the two major interpretations outlined above, Pyrrho in some sense did). Antigonus has transformed a hostile criticism of Pyrrho -- that, if one really were to adopt the attitudes he recommends, one *would* be unable consistently to live as a sane human being -- into an account of how Pyrrho actually did act; but there is no reason to take this seriously as biography. (It does, however, raise the question of what it means to mistrust the senses -- as the Aristocles passage tells us, on either interpretation, that Pyrrho did -- if this is to be consistent with self-preservation in one's ordinary behavior; we shall return to this point at the end of this section.)

But there are many other anecdotes, preserved in Diogenes and elsewhere, that cannot be dismissed in this fashion. The dominant impression that they convey as a group is of an extraordinary impassivity or imperturbability; with rare exceptions (which he himself is portrayed as regretting), Pyrrho is depicted as maintaining his calm and untroubled attitude no matter what happens to him. This extends even to extreme physical pain -- he is reported not to have flinched when subjected to the horrific techniques of ancient surgery -- but it also encompasses dangers such as being on a ship in a storm. (This is not to say that he did not avoid such troubles if he could, as suggested by the apocryphal stories mentioned in the previous paragraph; it is just to say that he did not lose his composure in the face of life's inevitable hardships.) There is another aspect to this untroubled attitude as well. In numerous anecdotes Pyrrho is shown as unconcerned with adhering to the normal conventions of society; he wanders off for days on end by himself, and he performs tasks that would normally be left to social inferiors, such as housework and even washing a pig. Here, too, the suggestion is that he does not care about things that ordinary people do care about -- in this case, the disapproval of others. (The passage from Diogenes quoted in the previous section, according to which Pyrrho held “that human beings do everything by convention and habit” is not necessarily in conflict with this; by ‘human beings’ Pyrrho might have meant *ordinary* human beings, among whom he would not have included himself.)

The fragments of Timon also emphasize Pyrrho's exceptional tranquillity, and add a further, more philosophical dimension to it. Several fragments suggest that this tranquillity results from his not engaging in theoretical inquiry like other philosophers, and with his not engaging in debate with those philosophers. Other thinkers are perturbed by their need to discover how the universe works, and to prevail in arguments with their rivals; Pyrrho is unconcerned about any of this.

Clearly it would be foolish to accept every detail of this composite account. Timon's picture is no doubt idealized, and the biographical material surely includes a measure of embellishment. Collectively, however, these fragments and anecdotes add up to a highly consistent portrait; it does not seem overconfident to take this at least as reflecting an ideal towards which Pyrrho strived, and which he achieved to a sufficient degree to have attracted notice.

What connections can be drawn between this portrait of Pyrrho's demeanor and the philosophy expounded in the Aristocles passage? What we have here, plainly, is a fuller specification of the *ataraxia* that the Aristocles passage promised as the outcome of the process of responding in the recommended way to the three questions. But *why* should this process be thought to yield *ataraxia*, and why should the outcome take the specific form suggested by the material discussed in this section? Now is a convenient

point to address these questions (as we did not do in initially examining the Aristocles passage). We may distinguish the overall emotional tranquillity depicted in the biographical material and the particular tranquillity, derived from the avoidance of theoretical inquiry, that is emphasized in the fragments of Timon.

The most obvious explanation for the overall emotional tranquillity would seem to be along the following lines. If one adopts the position recommended in the answers to the Aristocles passage's first two questions, one will not hold any definite beliefs, about any object or state of affairs, to the effect that the object or state of affairs really is good, or valuable, or worth seeking -- or, on the other hand, bad or to be avoided. (This will be true on either the metaphysical or the epistemological interpretations of the Aristocles passage.) Hence one will attach far less importance to the attainment or the avoidance of any particular objects, or the occurrence or non-occurrence of any particular state of affairs, than one would if one thought that these things really did have some kind of positive or negative value; nothing will matter to one to anything like the same extent as it matters to most people. If this is on the right lines, then Pyrrho's route to *ataraxia* closely resembles the one described in several places by Sextus Empiricus (*PH* 1.25-30, 3.235-8, *M* 11.110-67); the account I have given is in fact modeled after Sextus' explanation of how suspension of judgement produces *ataraxia*. Indeed, it is difficult to see how else the process is to be reconstructed. One difference, however, between the practical attitudes of Pyrrho and Sextus is that Sextus attributes an important role to convention in the shaping of one's behavior; more on this in a moment.

As for the avoidance of theoretical inquiry and debate, it is fair to assume that Pyrrho will have regarded such inquiry and debate as troublesome because it is necessarily fruitless and interminable. If the real nature of things is indeterminable by us, as the epistemological interpretation would have it, then to attempt to determine the nature of things, and to provide cogent grounds for the superiority of one's own theories, is to attempt the impossible; such matters are simply beyond our grasp. But if, as the metaphysical interpretation would have it, the world is in its real nature indefinite, then one is also attempting the impossible, though for a different reason; one is attempting to determine a fixed character for things that inherently lack any fixed character. Of course, the thesis that reality is indefinite is itself a definite statement. But it follows from this statement that any attempt to establish fixed and definite characteristics for specific items in the universe is doomed to failure. And it seems to be this kind of theoretical inquiry that Timon represents Pyrrho as eschewing; as one fragment puts it (addressing Pyrrho), “you were not concerned to inquire what winds hold sway over Greece, from where everything comes and into what it passes” (Diogenes Laertius 9.65). On this reading, then, Pyrrho's avoidance of inquiry and debate resembles the disdain for physical speculation that is apparent in some writings of Plato (the *Phaedo* for example); physical speculation is fruitless because the physical world is not susceptible to rational inquiry.

Here another difference may be discerned from the Pyrrhonism of Sextus Empiricus. For although Sextus certainly does not claim to have definite answers of his own concerning the nature of things, he has no qualms about engaging with his opponents in debate, or about pitting them against one another. Indeed, the Pyrrhonism of Sextus depends on a constant interplay of competing arguments on as many topics as possible. One's suspension of judgement results from one's experience of the ‘equal strength’

(*isostheneia*) of the competing considerations on all sides of a given issue; but this requires that one be regularly exposed to such competing considerations, and the works of Sextus are themselves bountiful sources for this. Sextus may agree with Pyrrho that such debates are interminable, but they have an important role in later Pyrrhonist practice nonetheless. Pyrrho's own practice is quite different, because his *ataraxia* flows not from an ongoing practice of intellectual juggling, but from a *conclusion* about the nature of things, as reported in the Aristocles passage -- either that it is indeterminable by us or that it is indefinite -- that he has arrived at once and for all.

We have seen that Pyrrho was unconcerned, or aspired to be unconcerned, about things that most of us care about very deeply. But how does one make any decisions at all, if one adopts this kind of attitude? Unless we are to believe the stories of Pyrrho as a madman depending on his friends to rescue him from precipices and dogs, we are entitled to expect an answer to this question. There is some evidence to suggest that the answer proposed -- if not by Pyrrho himself, then at least by Timon -- was that one relies on the appearances. If this is correct, we have another link, at least at a general level, with the Pyrrhonism of Sextus, for whom appearances are what he calls the “criterion of action”. One difference, as mentioned earlier, is that Sextus lists laws and customs as one of the four main varieties of appearances that one may use to guide one's behavior; on Sextus' account, then, certain courses of action will appear to one as desirable or undesirable given that they are approved or disapproved of by the prevailing mores. But Pyrrho seems to have been thoroughly unconventional in some aspects of his behavior. It is impossible to say specifically what kinds of phenomena were included for him and Timon under the heading of ‘the appearances’ -- or whether they had anything very precise in mind here. Nevertheless, it looks as if the early or proto-Pyrrhonist answer to the question of how one acts and makes decisions is that one does so in light of the way things appear to one. On the epistemological interpretation, this will amount to “in light of the characteristics that things seem to have (but, for all we know, may not really have)”; on the metaphysical interpretation, it will amount to “in light of the temporary and contingent characteristics that things manifest on any given occasion (but that are no part of how they *really are*, since how they really are is indefinite)”. In either case, the way in which one mistrusts sensations and common-sense opinions, as the Aristocles passage recommends, is not that one pays no attention to them in one's everyday behavior; one mistrusts them simply in that one does not take them as a guide to the underlying nature of things.

6. “The Nature of the Divine and the Good”

There is one further, highly problematic fragment of Timon that seems to belong in the area of practical philosophy. This is a set of four lines of verse that make reference to “the nature of the divine and the good”. There is no consensus on how to translate these lines, and different translations yield very different consequences for interpretation. The first two lines can be rendered either

> (A) “For I will say, as it appears to me to be,
> A word of truth, having a correct standard:”

or

(B) "For I will say, as it is plain to me that it is,
A word of truth, having a correct standard:"

The second two lines can be rendered either

(C) "That the nature of the divine and the good is eternal,
From which a most even-tempered life for a man is derived."

or

(D) "That the nature of the divine and the good is at any time
That from which life becomes most even-tempered for a man."

There are numerous other, less momentous disputes over the translation, but these alternatives put on display the central options for interpretation.

The lines are quoted by Sextus Empiricus (*M* 11.20); there is no further trace of them in the surviving record. The context in which Sextus introduces them shows that he is inclined to understand the first couplet according to reading (A) rather than reading(B); but he suggests that he is not sure about this. The speaker into whose mouth Timon put these lines is never identified, but it has generally been assumed to be Pyrrho.

If one understands the second couplet according to reading (C), then the speaker is apparently endorsing a position that attributes definite natures to things; and this appears flatly inconsistent with the Aristocles passage, on either the metaphysical or the epistemological reading. The tension is especially bad if one reads the first couplet according to reading (B), in which case the speaker is insisting that he is in possession of the truth. But even on reading(A), where the effect is to weaken the assertion to one about what appears to the speaker to be the case, the statement about "the nature of the divine and the good" seems strikingly out of keeping with the rest of what we hear about Pyrrho's philosophy. It has been suggested that Pyrrho made an exception, in the case of the divine and the good, to his general prohibition on attributing definite natures to things; but it is hard to see the motivation for such a move, and this interpretation has not been generally accepted. It is true that Cicero speaks of Pyrrho as holding that virtue is the sole good, and that no distinctions of value are to be drawn among things other than virtue and vice. However, as was mentioned earlier, Cicero always attributes this view to Pyrrho alongside the unorthodox Stoic Aristo of Chios; he never gives any details about Pyrrho's thinking specifically. We know from other sources that Aristo did hold this position; and, as we have seen, there is good reason to think that Pyrrho did refrain quite generally from attributing positive or negative value to ordinary objects of concern (things other than virtue and vice), which is one part of the position Cicero attributes to him and Aristo. So it looks as if Cicero has been misled (probably by the sketchiness of the information in his source) into thinking that Pyrrho agreed with Aristo in both parts of his position rather than in just one part. At any rate, Cicero cannot be regarded as offering any credible support for an interpretation of Pyrrho that has him believing in a natural good; again, this is just too discordant with the remainder of the evidence.

Reading (D) of Timon's second couplet (which is due, with minor modifications, to Burnyeat (1980)) is intended to eliminate the troublesome reference to an eternal real nature. According to this interpretation, the phrase “the nature of the divine and the good” refers simply to a characteristic that is attributed to Pyrrho, and labeled by poetic hyperbole as ‘divine’, in another fragment of Timon, namely his extraordinary tranquillity; the couplet as a whole, then, is saying that tranquillity is the source of an even-tempered life. And if one combines this with the less dogmatic reading (A) of the first couplet, this yields a set of remarks that are not obviously in conflict with anything else in the record on Pyrrho.

The acceptability of the translation in reading (D) is not beyond question. There is also some question whether the claim that tranquillity is the source of an even-tempered life is anything more than vacuous. However, if one assumes that Pyrrho is the speaker of these lines, then this interpretation or something close to it seems to be the only way to rescue his thought (as reported by Timon) from inconsistency. Another possibility is to drop the assumption that Pyrrho is the speaker; in this case, there is no reason to assume that the thought expressed by the lines must be consistent with what we know of Pyrrho's philosophy. But if one takes this option, one must devise an alternative explanation for why Timon would have written these lines -- including some account of who else the speaker might be. It is fair to say that no resolution of these matters is in sight; the fragment continues to be regarded as one of the most intractable pieces of evidence in the corpus of material on Pyrrho and Timon..

7. Influences on Pyrrho

Many different philosophical antecedents have been claimed for Pyrrho. Since we know very little about which philosophical currents Pyrrho may have been acquainted with, such claims are bound to be in large measure speculative. There are, however, a couple of exceptions to this; as noted at the outset, Pyrrho was associated with Anaxarchus and was reported to have encountered some unnamed Indian thinkers. The little that we know of Anaxarchus seems to suggest that his philosophy had a good deal in common with Pyrrho's. Diogenes Laertius (9.60) ascribes to him an attitude of *apatheia* and *eukolia*, ‘freedom from emotion’ and ‘contentedness’; *apatheia* is used in some sources to describe Pyrrho's attitude as well, and the combination of the two terms seems to describe something close to the state cultivated by Pyrrho. We also hear from Sextus Empiricus that Anaxarchus “likened existing things to stage-painting and took them to be similar to the things which strike us while asleep or insane” (*M* 7.88). This has often been taken as an early expression of a form of epistemological scepticism. But it may also be taken as an ontological comment on the insubstantiality of the world around us; it is *things* (as opposed to our impressions of things) that are assimilated to stage-sets and the contents of dreams and fantasies. Either way, the remark looks like an anticipation of Pyrrho's position in the Aristocles passage; the first reading conforms to the epistemological interpretation of that passage, and the second to the metaphysical interpretation. It appears, then, that Pyrrho may have borrowed to a considerable extent from Anaxarchus. There is, however, no indication that Anaxarchus drew a connection between his view of the nature of things and his attitude of emotional contentment, such as we have seen that Pyrrho did.

We do not know the identity of the “naked wise men” whom Pyrrho met in India, or what they thought. There are reports of other meetings between Indian and Greek thinkers during Alexander's expedition,

and these tend to emphasize the Indians' extraordinary impassivity and insensitivity to pain and hardship. It is not unlikely that Pyrrho, too, was impressed by traits of this kind. Though precedents for his ideal of *ataraxia* exist in earlier Greek philosophy as well, his reported ability to withstand surgery without flinching is exceptional in the Greek context (and quite distinct from anything in later Pyrrhonism); if we believe this story, it is tempting to explain it by way of some form of training from the Indians. Some scholars have sought to establish more detailed links between the thought of the Aristocles passage and various currents in ancient Indian philosophy. But it is not clear how far these similarities really go; and in any case, it is not easy to imagine an interchange of any great philosophical subtlety occurring between the Indians and Pyrrho, given the linguistic barriers.

Beyond these figures with attested connections to Pyrrho, it is plausible to suppose a certain influence on Pyrrho from Democritus. Pyrrho is reported to have had a special admiration for Democritus (Diogenes Laertius 9.67, citing Pyrrho's associate Philo); Democritus is one of the few philosophers besides Pyrrho himself who seems to escape serious criticism in Timon's *Lampoons*; and Anaxarchus belonged in the tradition of thinkers stemming from Democritus. The influence may have been mainly in the ethical area; Democritus, too, had an ethical ideal that is recognizably a forerunner to Pyrrho's *ataraxia*. If one adopts the epistemological interpretation of Pyrrho's philosophy, one may see an additional area of influence in Democritus' sceptical pronouncements about the prospects for knowledge of the world around us.

Alternatively, if one interprets Pyrrho along metaphysical lines, one may be inclined to look to Plato and the Eleatics as possible influences. Timon's verdicts on these figures in the *Lampoons* are at least partially favorable; and, as was hinted at earlier on, the dim view of sensibles that is suggested by a number of Plato's dialogues -- but also anticipated by the Eleatics -- seems to have something in common with Pyrrho's view of reality (on the metaphysical interpretation) as indeterminate. The difference, of course, is that Pyrrho does not suggest any higher level of reality such as Plato's Forms or the Eleatic Being.

8. Pyrrho's Influence

Pyrrho's relation to the later Pyrrhonists has already been discussed. Given the importance of Pyrrhonism in earlier modern philosophy, Pyrrho's indirect influence may be thought of as very considerable. But beyond his being adopted as a figurehead in later Pyrrhonism -- itself never a widespread philosophical movement -- Pyrrho seems to have had very little impact in the ancient world after his own lifetime. Both Cicero and Seneca refer to Pyrrho as a neglected figure without a following, and the surviving testimonia do not contradict this impression. It is possible that he had some influence on the form of scepticism adopted by Arcesilaus and other members of the Academy; the extent to which this is so is disputed and difficult to assess. It is also possible that the Epicureans, whose aim was also *ataraxia*, learned something from Pyrrho; there are indications of an association between Pyrrho and Nausiphanes, the teacher of Epicurus. But if so, the extent of the Epicureans' borrowing was strictly limited. For them, *ataraxia* is to be attained by coming to understand that the universe consists of atoms and void; and the Epicureans' attitude towards the senses was anything but one of mistrust.

Max Stirner

Max Stirner (1806-56) is best known as the author of the idiosyncratic and provocative *Der Einzige und sein Eigenthum* (1844). Familiar in English as *The Ego and Its Own* (a more literal translation might be *The Individual and his Property*), both the form and content of Stirner's work are disconcerting. He challenges expectations about how political and philosophical argument should be conducted, and seeks to shake confidence in the superiority of contemporary civilisation. He provides a sweeping attack on the modern world as dominated by religious modes of thought and oppressive social institutions, together with a brief sketch of a radical ‘egoistic’ alternative in which individual autonomy might flourish. The historical impact of *The Ego and Its Own* is not easy to assess. However, Stirner's book can plausibly be claimed to have had a destructive impact on his left-Hegelian contemporaries, to have played a significant role in the intellectual development of Karl Marx (1818-1883), and to have influenced the tradition of individualist anarchism.

1. Stirner's Life and Work

There is a stark contrast between the often melodramatic tone of Stirner's best-known work and the rather less sensational, indeed occasionally abject, events of his own life.

Stirner was born Johann Caspar Schmidt on 25 October 1806, the only child of lower middle class Lutheran parents living in Bayreuth. (‘Stirner’ was originally a nickname, resulting from his large

forehead, and only later adopted, as ‘Max Stirner’, first as a literary pseudonym, and then as his preferred name.) His father died when Stirner was only six months old, and he was brought up by his mother (who remarried) and then later by an aunt (who, when his mother moved from Bayreuth, looked after Stirner in order that he could continue his schooling at the renowned local Gymnasium). Stirner subsequently pursued his undergraduate studies, with little notable academic distinction, at the universities of Berlin, Erlangen, and Königsberg. At Berlin, he is known to have attended three lecture-series given by G.W.F. Hegel (1770-1831): on the philosophy of religion; on the history of philosophy; and on the philosophy of subjective spirit (whose subject matter concerned the cognitive structures and processes of the individual mind).

Towards the end of his university career, Stirner is said to have devoted much of his time to ‘family affairs’, a euphemism for his mother's deteriorating mental health. In 1832, he returned with his mother to Berlin, and sought, with only partial success, to qualify as a teacher. (Stirner's mother was committed to a mental home in 1837 and she would finally outlive him by some three years.) A period of private study and irregular work followed, including eighteenth months as an unpaid Latin teacher. During this time he married Agnes Butz (1815-1838), the illegitimate daughter of his landlady. Edgar Bauer (1820-1886) would later record that Stirner had confessed that having once caught sight of his wife naked he had been unable to touch her again. In August 1838, Agnes died giving birth to a still-born child.

Between 1839 and 1844 Stirner maintained something of a double life in Berlin. He obtained a position at a well-regarded private girls' school, and spent the next five years teaching history and literature, establishing a reputation as a polite and reliable teacher. Away from his teaching post, however, Stirner began to frequent the more avant-garde of Berlin's intellectual haunts. He used the reading room of the novelist Willibald Alexis (1798-1871), spent afternoons at the Café Stehely, and from 1841 onwards was a regular visitor to Hippel's wine bar on the Friedrichstrasse. The latter was the main meeting place of ‘the free’, an increasingly bohemian group of teachers, students, officers, and journalists, under the loose intellectual leadership of the left-Hegelian Bruno Bauer (1809-1882), who had recently been dismissed from his teaching post at the University of Bonn following an offical inquiry into the orthodoxy of his writings on the New Testament. This group included Marie Dähnhardt (1818-1902) who became Stirner's second wife (and the dedicatee of *The Ego and Its Own*). In this unconventional environment, and despite his calm and unassuming personal appearance, Stirner gained a reputation for his hostility to religion, intolerance of moderation, and ability to provoke fierce argument.

Stirner's earliest published writings date from this time in Berlin. In addition to some short and unremarkable pieces of journalism for the *Rheinische Zeitung* and the *Leipziger Allgemeine Zeitung*, they include a knowing review of Bruno Bauer's anonymous and parodic attack on Hegel in *The Trumpet of the Last Judgement* (1842) and an article on pedagogy entitled “The False Principle of Our Education” (1842), which adumbrated some of the themes of his own later work (for example, contrasting the training of individuals to an alien calling with the cultivation of the predisposition to become ‘sovereign characters’). During this period, Stirner is said to have occasionally alluded to a book that he was working on, but it seems that few of his associates took its existence seriously. The impact of *The Ego and Its Own* on these left-Hegelian circles was to be both considerable and unexpected. Stirner finished the book in April 1844 and *The Ego and Its Own* was subsequently published by the Leipzig bookseller Otto Wigand

(1795-1870) in an edition of a thousand copies (although dated 1845 the book appears to have been widely available by November of the previous year).

Measured by the reaction that it produced, *The Ego and Its Own* could be described as a critical success. The book was widely reviewed, and attracted attention from such leading figures as Bettina von Arnim (1785-1859), the doyenne of the Berlin literati, and Kuno Fischer (1824-1907), the distinguished neo-Kantian historian of philosophy. The book also generated responses from many of its left-Hegelian targets: Bruno Bauer, Ludwig Feuerbach (1804-1872), Moses Hess (1812-1875), and Arnold Ruge (1802-1880), all ventured into print in order to defend their own views against Stirner's polemic. However, *The Ego and Its Own* was neither a popular nor a financial success. Stirner had left his teaching post shortly before the book was published, and, by 1846, having squandered much of his second wife's inheritance, he was reduced to advertising in the *Vossische Zeitung* for a loan. Marie Dähnhardt left him towards the end of the same year. Many years later she was traced by Stirner's loyal biographer, the poet and novelist John Henry Mackay (1864-1933), to a Roman Catholic religious community in England. She refused to meet Mackay in person but wrote to him describing Stirner as a very sly man whom she had neither respected nor loved, and claiming that their relationship together had been more of a cohabitation than a marriage.

From 1847, Stirner led a quiet and miserable existence. He remained curiously detached from contemporary events (he seems, for example, to have largely ignored the revolution of 1848), and his daily life was increasingly dominated by economic hardship. Stirner continued to write intermittently, but commentators have generally found his later work to be of little independent interest (that is, apart from its uncertain potential to illuminate *The Ego and Its Own*). He translated into German some of the economic writings of Jean-Baptiste Say (1767-1832) and Adam Smith (1723-1790), and may have written a series of short journalistic pieces for the *Journal des oesterreichischen Lloyd*. In 1852, he published part of a *History of Reaction*, mainly consisting of excerpts from other authors, including Edmund Burke (1729-1797). Stirner's main strategy for economic survival in this period relied on changing addresses in order to evade his creditors, although he does not appear to have moved quickly enough to avoid two brief periods in a debtors' prison in 1853 and 1854.

In May 1856, still living in reduced circumstances in Berlin, Stirner fell into a fever after being stung in the neck by a winged insect. Following a brief remission, he died on 25 June. His death went largely unnoticed by the outside world.

2. *The Ego and Its Own*

2.1 Form and Structure

Modern readers hoping to understand *The Ego and Its Own* are confronted by several obstacles, not least the form, structure, and argument, of Stirner's book.

Much of Stirner's prose—which is crowded with aphorisms, italicisation, and hyperbole—appears calculated to disconcert. Most striking, perhaps, is the use of word play. Rather than reach a conclusion through the conventional use of argument, Stirner often approaches a claim that he wishes to endorse by exploiting words with related etymologies or formal similarities. For example, he frequently associates words for property (such as ‘*Eigentum*’) with words connoting distinctive individual characteristics (such as ‘*Eigenheit*’) in order to promote the claim that property is expressive of selfhood. (Stirner's account of egoistic property—see below—gives this apparently orthodox Hegelian claim a distinctive twist.)

This rejection of conventional forms of intellectual discussion is linked to Stirner's substantive views about language and rationality. His unusual style reflects a conviction that both language and rationality are human products which have come to constrain and oppress their creators. Stirner maintains that accepted meanings and traditional standards of argumentation are underpinned by a conception of truth as a privileged realm beyond individual control. As a result, individuals who accept this conception are abandoning a potential area of creative self-expression in favour of adopting a subordinate role as servants of truth. In stark contrast, Stirner insists that the only legitimate restriction on the form of our language, or on the structure of our arguments, is that they should serve our individual ends. It is the frequent failure of ordinary meanings and standard forms of argument to satisfy his interpretation of this criterion which underpins Stirner's remorselessly idiosyncratic style.

The Ego and Its Own has an intelligible, but scarcely transparent, structure. It is organised around a tripartite account of human experience, initially introduced in a description of the stages of an individual life. The first stage in this developmental narrative is the *realistic* one of childhood, in which children are constrained by material and natural forces such as their parents. Liberation from these external constraints is achieved with what Stirner calls the self-discovery of mind, as children find the means to outwit those forces in their own determination and cunning. The *idealistic* stage of youth, however, contains new internal sources of constraint, as individuals once more become enslaved, this time to the spiritual forces of conscience and reason. Only with the adulthood of *egoism* do individuals escape both material (external) and spiritual (internal) constraints, learning to value their personal satisfaction above all other considerations.

Stirner portrays this dialectic of individual growth as an analogue of historical development, and it is a tripartite account of the latter which structures the remainder of the book. Human history is reduced to successive epochs of realism (the ancient, or pre-Christian, world), idealism (the modern, or Christian, world), and egoism (the future world). Part One of *The Ego and Its Own* is devoted to the first two of these subjects, whilst Part Two is concerned with the third of them.

2.2 The Ancient and Modern Worlds

Part One of *The Ego and Its Own* is backward-looking, in that it is concerned with the ancient and modern worlds rather than with the future, and negative, in that its primary aim is to demonstrate the failure of modernity to escape from the very religious modes of thought which it claims to have outgrown. The bulk of Stirner's historical account is devoted to the modern epoch, and he discusses the

ancient world only insofar as it contributes to the genesis of modernity. In both cases, however, the majority of his examples are taken from the realm of cultural and intellectual affairs. Cumulatively these examples are meant both to undermine historical narratives which portray the modern development of humankind as the progressive realisation of freedom and to support an account of individuals in the modern world as increasingly oppressed by the spiritual. For Stirner, the subordination of the individual to spirit—in any of its guises—counts as religious servitude.

Stirner's account of the historical development of modernity largely revolves around a single event, the Reformation. He attempts to show that, from the perspective of the individual, the movement from Catholic to Protestant hegemony was not a liberating one, but instead constituted both an extension and intensification of the domination of spirit. The Reformation extended, rather than contracted, the sphere of religious control over the individual because it refused to recognise the distinction between the spiritual and the sensuous. Rather than prevent priests marrying, for example, Protestantism made marriage religious, thereby absorbing the sensuous into the sphere of the spiritual. The Reformation also intensified, rather than relaxed, the bond between individuals and religion. The more inward faith of Protestantism, for example, established a perpetual internal conflict between natural impulses and religious conscience. In a typically vivid and belligerent metaphor, Stirner describes this internal conflict in the individual as analogous to the struggle between the population and the secret police in the contemporary body politic.

Stirner's claim that the modern world reproduced, rather than abolished, religious modes of thought provides the opportunity for a sustained attack on the writings of his left-Hegelian contemporaries, Ludwig Feuerbach in particular, for failing to overcome the subordination of the individual to spirit. Stirner's expansive definition of religion enables him to portray Feuerbach's work as sustaining rather than undermining religious modes of thought. The primary error of Christianity, according to Feuerbach, was that it took human predicates and projected them into another world as if they constituted an independent being. However, Stirner insists that Feuerbach's rejection of God as a transcendental subject leaves the divinity of the Christian predicates untouched. In short, rather than describing human nature as it is, Feuerbach is said to have deified a prescriptive account of what being human involves. As a result, the real kernel of religion, the positing of an ‘essence over me’ (46), had been left intact. (All page references in parenthesis are to the English translation of *The Ego and Its Own* cited in the Bibliography below.) Indeed, Stirner suggests that Feuerbach's achievement was to have effected a ‘change of masters’ (55) which made the tyranny of the divine over the individual even more complete, because human nature (unlike the conventional Christian God) was an immanent divinity which could possess both believers and unbelievers alike.

Stirner extends his critique to the work of all the left-Hegelians, including those with whom he had associated in Berlin. Although they disagreed about the content of human nature—for ‘political liberals’ like Arnold Ruge human nature was identified with citizenship, for ‘social liberals’ like Moses Hess human nature was identified with labour, and for ‘humane liberals’ like Bruno Bauer human nature was identified with critical activity—all the left-Hegelians are said to have reproduced the basic Feuerbachian error: separating the individual from his human essence, and setting that essence above the individual as something to be striven for. In contrast, Stirner maintains that because it has no universal or prescriptive

content, human nature cannot ground any claim about how we ought to live. His own intellectual project—which he describes as an attempt to rehabilitate the prosaic and mortal self, the ‘un-man’ (124) for whom the notion of a calling is alien—is intended as a radical break with the work of these contemporaries.

2.3 The Egoistic Future

Part Two of *The Ego and Its Own* is forward-looking, in that it is concerned with the egoistic future rather than the ancient or modern worlds, and positive, in that it aims to establish the possibility that Stirner's contemporaries could escape the tyranny of religion.

Stirner's account of the developing historical relationship between the individual and society is advanced in a series of parallels which are designed to portray egoism as the embodiment of a more advanced civilisation. At one point, he neatly inverts the terms of a familiar progression (rehearsed by countless early modern political thinkers) from a state of nature to civil society. It is membership of society, and not isolation, Stirner suggests, which is humankind's “state of nature” (271), in that it constitutes an early stage of development whose inadequacies are, in due course, outgrown. Elsewhere, he describes the developing relationship between the individual and society as analogous to that between a mother and her child. As the individual (the child) develops a mature preference for a less suffocating environment, it must throw off the claims of society (the mother) which seeks to maintain it in a subordinate position. In both cases, Stirner draws the lesson that the individual must move from social to egoistic relationships in order to escape subjection.

What is meant by ‘egoism’, however, is not always clear. Stirner is occasionally portrayed as a psychological egoist, that is, as a proponent of the descriptive claim that all (intentional) actions are motivated by a concern for the self-interest of the agent. However, this characterisation of Stirner's position appears mistaken. Not least, *The Ego and Its Own* is structured around the opposition between egoistic and non-egoistic forms of experience. Indeed, he appears to hold that non-egoistic action has predominated historically (in the epochs of realism and idealism). Moreover, at one point, Stirner explicitly considers adopting the explanatory stance of psychological egoism only to reject it. In a discussion of a young woman who sacrifices her love for another in order to respect the wishes of her family, Stirner remarks that an observer might be tempted to maintain that selfishness has still prevailed in this case since the woman clearly preferred the wishes of her family to the attractions of her suitor. However, Stirner rejects this hypothetical explanation, insisting that, provided “the pliable girl were conscious of having left her self-will unsatisfied and humbly subjected herself to a higher power” (197), we should see her actions as governed by piety rather than egoism.

It is also a mistake to think of Stirner as advocating a normative proposition about the value of self-interested action. Stirnerian egoism needs to be distinguished from the individual pursuit of narrow self-interest as it is conventionally understood. In *The Ego and Its Own,* Stirner discusses the important example of an avaricious individual who sacrifices everything in pursuit of material riches. Such an individual is clearly self-interested (he acts only to enrich himself) but it is an egoism which Stirner

rejects as one-sided and narrow. Stirner's reason for rejecting this form of egoism is instructive. He suggests that the avaricious man has become enslaved to a single end, and such enslavement is incompatible with egoism properly understood.

Stirnerian egoism is perhaps best thought of, not in terms of the pursuit of self-interest, but rather as a variety of individual self-government or autonomy. Egoism properly understood is to be identified with what Stirner calls ‘ownness [*Eigenheit*]’, a type of autonomy which is incompatible with any suspension, whether voluntary or forced, of individual judgement. “I am my own”, Stirner writes, “only when I am master of myself, instead of being mastered … by anything else” (153). This Stirnerian ideal of self-mastery has external and internal dimensions, requiring both that we avoid subordinating ourselves to others and that we escape being ‘dragged along’ (56) by our own appetites. In short, Stirner not only rejects the legitimacy of any subordination to the will of another but also recommends that individuals cultivate an ideal of emotional detachment towards their own appetites and ideas.

Judged against this account of egoism, characterisations of Stirner as a ‘nihilist’—as rejecting all normative judgement—would also appear to be mistaken. The popular but inaccurate description of Stirner as a ‘nihilist’ is encouraged by his explicit rejection of morality. Morality, on Stirner's account, involves the positing of obligations to behave in certain fixed ways. As a result, he rejects morality as incompatible with egoism properly understood. However, this rejection of morality is not grounded in the rejection of values as such, but in the affirmation of what might be called non-moral goods. That is, Stirner allows that there are actions and desires which, although not moral in his sense (because they do not involve obligations to others), are nonetheless to be assessed positively. Stirner is clearly committed to the non-nihilistic view that certain kinds of character and modes of behaviour (namely autonomous individuals and actions) are to be valued above all others. His conception of morality is, in this respect, a narrow one, and his rejection of the legitimacy of moral claims is not to be confused with a denial of the propriety of all normative judgement. There is, as a result, no inconsistency in Stirner's frequent use of an explicitly evaluative vocabulary, as when, for example, he praises the egoist for having the ‘courage’ (265) to lie, or condemns the ‘weakness’ (197) of the individual who succumbs to pressure from his family.

Two features of Stirner's position emerge as fundamental. First, he values ‘ownness’ neither as one good amongst many, nor as the most important of several goods, but rather as the only good. Second, he adopts an account of self-mastery which is incompatible with the existence of any legitimate obligations to others, even those which an individual has voluntarily undertaken (thereby rejecting perhaps the most familiar way of reconciling individual autonomy with the existence of binding obligations). In short, Stirner appears to value nothing other than individual self-mastery, and he interprets the latter in a stringent and idiosyncratic manner.

2.4 Some Consequences of Egoism

The consequences of Stirner's position appear extreme and far-reaching. As the example of morality suggests, egoists are likely to find themselves in conflict with some cherished social institutions and

practices. Stirner consistently associates (non-egoistic) society with relationships of ‘belonging’, which he treats as involving the subjugation of individuals. For example, he maintains that ‘the forming of family ties binds a man’ (102). (Stirner never appears to consider seriously the possibility that, in at least some of these social relationships, belonging might have more positive associations; for example, of being at home or of feeling secure.) Confronted with the conflict between egoism and ‘society’, Stirner is not prompted to re-examine his commitment to, or understanding of, self-mastery, but instead confidently denies the legitimacy of those conventional institutions and practices. Two examples of this response may suffice.

On Stirner's account, there is a necessary antipathy between the egoistic individual and the state. This inevitable hostility is based on the conflict between Stirner's conception of autonomy and any obligation to obey the law. “Own will and the state”, he writes, “are powers in deadly hostility, between which no ‘perpetual peace’ is possible” (175). Since self-mastery is incompatible with, and valued more highly than, any obligation to obey the law, Stirner rejects the legitimacy of political obligation. Note that this rejection stands irrespective of the foundation of that political obligation, and whatever the form of the state. “Every state”, Stirner insists, “is a despotism, be the despot one or many.” (175) Even in the hypothetical case of a direct democracy in which a collective decision had been made unanimously, Stirner denies that the egoist would be bound by the result. To be bound today by “my will of yesterday”, he maintains, would be to turn my ‘creature’, that is ‘a particular expression of will’, into my ‘commander’; it would be to freeze my will, and Stirner denies that ‘because I was a fool yesterday I must remain such’ (175).

Promise-keeping is another early victim of this commitment to, and understanding of, self-mastery. Stirner associates the institution of promising with illegitimate constraint, since the requirement that duly made promises be kept is incompatible with his understanding of individual autonomy. Stirner rejects any general obligation to keep promises as just another attempt to bind the individual. The egoist, he suggests, must embrace the heroism of the lie, and be willing to break even his own word “in order to determine himself instead of being determined” (210). Note that Stirner's enthusiasm is reserved not for those who break their word in the service of some larger spiritual goal (as Luther, for example, became unfaithful to his monastic vows for God's sake), but rather for the individual who is willing to break his word for his own sake.

As well as a negative account of the institutions and practices that egoists must reject as incompatible with autonomy, *The Ego and Its Own* also contains some positive suggestions about the possible shape of egoistic relationships which do not conflict with individual self-mastery. In particular, Stirner provides a brief sketch of what he calls the “union of egoists [*Verein von Egoisten*]” (161).

The egoistic future is said to consist not of wholly isolated individuals but rather in relationships of ‘uniting’, that is, in impermanent connections between individuals who themselves remain independent and self-determining. The central feature of the resulting union of egoists is that it does not involve the subordination of the individual. The union is “a son and co-worker” (273) of autonomy, a constantly shifting alliance which enables individuals to unite without loss of sovereignty, without swearing allegiance to anyone else's ‘flag’ (210). This union of egoists constitutes a purely instrumental association

whose good is solely the advantage that the individuals concerned may derive for the pursuit of their individual goals; there are no shared final ends and the association is not valued in itself.

Stirner occasionally appears uncertain as to how best to elaborate this basic account of egoistic social relations. In *The Ego and Its Own*, he appears to be pulled in two divergent directions.

In the first, and least typical, of these moods, Stirner shies away somewhat from the suggestion that his views might have radical consequences. More precisely, he seeks to suggest that certain familiar and worthwhile relationships (such as 'love') might continue into the egoistic future. This suggestion is presumably aimed at making that future appear more attractive (not least to those attached to these familiar and worthwhile relationships). However, it is far from certain that all of the relationships he mentions would emerge intact from their reincarnation in egoistic form.

Consider, for example, Stirner's contrast between two different kinds of love: the 'bad case' where 'ownness' is sacrificed, and egoistic love in which self-mastery is retained. Egoistic love allows the individual to deny himself something in order to enhance the pleasure of another, but only because his own pleasure is enhanced as a result. The object of egoistic love, in other words, remains the individual himself. The egoist will not sacrifice his autonomy and interests to another, but rather loves only as long as "love makes me happy" (258). At one point, Stirner characterises this relationship as one in which the individual 'enjoys' the other (258). The description is a revealing one, since enjoying another person and loving them would appear to be rather different matters. Loving another person in the conventional (and non-egoistic) sense might be thought to include the desire to promote the welfare of that person, even when it is not in our interests, or when it conflicts with our own wants and happiness. In this respect, it stands at some distance from Stirner's account of egoistic love. The point here is not a terminological one—Stirner rightly cares little whether we call egoistic love 'love' and "hence stick to the old sound" (261) or whether we invent a new vocabulary—but rather that a world without this experience would be an unfamiliar and impoverished one. Stirner appears to have failed to establish that this particular familiar and worthwhile relationship would survive this reestablishment on egoistic premises.

In the second, and more representative, of these moods, Stirner acknowledges the radical and unfamiliar consequences of adopting an egoistic order. Indeed, in places, he might be said to revel in the acknowledgement that his views have startling consequences from which few will take any solace. This is one of the sources of the melodramatic tone of parts of *The Ego and Its Own*.

Stirner describes the relation between the egoist and his objects (which include, of course, other persons) as a property relation. The egoist stands in a relation of 'ownership' to the wider world. This notion of 'egoistic property' is not to be confused with more familiar juridical concepts of ownership (such as private property or collective ownership). These more familiar forms of property rest on notions of right, and involve claims to exclusivity or constraints on use, which Stirner rejects. Egoistic property is rather constituted by the 'unlimited dominion' (223) of individuals over the world, by which Stirner appears to mean that there are no moral constraints on how an individual might relate to things and other persons. Stirner sometimes describes the resulting association between people as involving relationships "of utility, of use" (263). The egoist, he suggests, views others as "nothing but—my food, even as I am fed

upon and turned to use by you" (263). Stirner embraces the stark consequences of this rejection of any general obligation towards others, insisting, for example, that the egoist does not renounce "even the power over life and death" (282). Over the course of the book, he variously declines to condemn the officer's widow who strangles her child (281), the man who treats his sister 'as wife also' (45), and the murderer who no longer fears his act as a 'wrong' (169). In a world in which "we owe each other nothing" (263), it seems that acts of infanticide, incest, and murder, might all turn out to be justified.

Stirner acknowledges that few readers of *The Ego and Its Own* will draw any comfort from his vision of an egoistic future, but insists that the welfare of this audience is not of any interest to him. Indeed, Stirner suggests that, if he had been motivated by a concern for others, then he would have had to conceal rather than propagate his ideas. As it is, even if he had believed that these ideas would lead to the "bloodiest wars and the fall of many generations" (263) Stirner maintains that he would still have disseminated them.

3. Stirner's Influence

At the time of his death, Stirner's brief period of notoriety was long over, his book had been out of print for several years, and there was little sign that his work might have any longer term impact. Since then, however, *The Ego and Its Own* has been translated into at least eight languages, and appeared in over one hundred editions.

Many of the shifting claims that have been made for the influence of Stirner's ideas would appear to reflect changing historical enthusiasms as much as they accurately capture central features of his thought. For example, at the beginning of the twentieth century, Stirner was frequently portrayed as a precursor of Friedrich Nietzsche (1844-1900), as having anticipated, if not influenced (it is far from certain that Nietzsche had ever read Stirner's work), both the style and substance of Nietzsche's work. In the 1960s and early 1970s, Stirner was rediscovered as a forerunner of existentialism, whose anti-essentialist concept of the self as a 'creative nothing' had affinities with the notion of human nature employed by Jean-Paul Sartre (1905-1980). More recently, Stirner has been identified as a nascent poststructuralist, employing a genealogical critique of humanist discourses of power and identity. It would be wrong to suggest that these various parallels are wholly implausible. Nevertheless, they may not offer the most accurate account of Stirner's impact on philosophical and political thought.

The influence of Stirner's work is perhaps more plausibly located in two rather different contexts. As far as its contemporary impact on the cultural life of *Vormärz* Germany is concerned, *The Ego and Its Own* had a destructive impact on Stirner's left-Hegelian contemporaries, and played a significant role in the intellectual development of Karl Marx. As far as its longer term historical influence is concerned, Stirner's work has become a founding text in the tradition of individualist anarchism.

Stirner's insistence that his radical contemporaries had failed to break with religious modes of thought prompted most of the leading left-Hegelians to defend their own work in public against this attack. In perhaps the most important of these replies, a defensive and ill-tempered Feuerbach (who suspected

Stirner of trying to make a name for himself at his own expense) was widely seen as struggling to maintain a besieged and outdated position. Stirner responded to three of these left-Hegelian reviews—the defence of Bauer's ‘humane liberalism’ by ‘Szeliga’ (the pseudonym of Franz Zychlinski (1816-1900)); the defence of socialism by Moses Hess; and the defence of Feuerbach by Feuerbach himself—in an article entitled ‘Stirner's Critics’ (1845). In this confident rejoinder, Stirner reiterated some of the central themes of *The Ego and Its Own* and clarified the character of his commitment to egoism.

Stirner's work also had a significant impact on a little known contemporary associate of these left-Hegelians, one Karl Marx. Between 1845 and 1846, Marx collaborated with Friedrich Engels (1820-1895) on *The German Ideology*, a fierce and sustained attack on their erstwhile philosophical contemporaries. They were unsuccessful in finding a publisher for their lengthy polemic and it was 1932 before this critical engagement with the work of Bauer, Feuerbach, and Stirner, appeared in print. The account of Stirner contained in *The German Ideology* takes up over three hundred pages of the published text (unfortunately abridged editions occasionally omit this dense but fascinating part of the book), and, although Marx is remorselessly critical of Stirner's position, it scarcely follows that *The Ego and Its Own* was without influence on the former's own work. Not least, Stirner's book appears to have been decisive in motivating Marx's break with the work of Feuerbach, whose influence on many of Marx's earlier writings is readily apparent, and in forcing Marx to reconsider the role that concepts of human nature should play in social criticism.

Finally, and over a longer period of time, the author of *The Ego and Its Own* has become best-known as a member of, and influence upon, the anarchist tradition. In particular, Stirner's name appears with familiar regularity in historically-orientated surveys of anarchist thought as one of the earliest and best-known exponents of individualist anarchism. The affinity between Stirner and anarchism lies in his rejection of political obligation and in his denial of the legitimacy of the state. However, unlike many anarchists, Stirner does not maintain that individuals have a positive obligation to destroy the state (insofar as this may lie within their power), but rather suggests that individuals should simply cheat and evade the state's demands in order to maintain their autonomy. Anarchists influenced by Stirner's individualism and his suspicion of the state can be found in several European countries. However, his best-known anarchist admirers were in America, in the circle which formed around Benjamin R. Tucker (1854-1939) and the remarkable journal *Liberty* (founded in 1881).

Stirner is unlikely to have regretted these disputes about the nature and influence of *The Ego and Its Own*. In considering the various interpretative accounts of the Bible, he himself declined to chose between the judgement of the child who played with the book, the Inca emperor Atahualpa (c.1502-1533) who threw it away when it failed to speak to him, the priest who praised it as the word of God, and the critic who dissected it as a purely human invention. The plurality of interpretations of his own work might well have both amused Stirner and encouraged him in his view that there could be no legitimate constraints on the meaning of a text. Stirner once described himself as writing to procure for his thoughts an existence in the world, and insisted that what subsequently happened to these ideas ‘is your affair and does not trouble me’ (263).

Bibliography

Works by Stirner

- *Der Einzige und sein Eigentum* (Stuttgart: Philipp Reclam, 1972). (A modern edition of Stirner's best-known work.)
- *Max Stirner's Kleinere Schriften und seine Entgegnungen auf die Kritik seines Werkes "Der Einzige und sein Eigentum". Aus den Jahren 1842-1848*, edited by J.H. Mackay, second revised edition (Berlin: Bernhard Zack, 1914). (An extensive collection of Stirner's lesser writings.)
- *Parerga Kritiken Repliken*, edited by Bernd A. Laska (Nürnberg: LSR, 1986). (A modern selection of Stirner's lesser writings.)

Works by Stirner in Translation

- *The False Principle of Our Education*, edited by James J. Martin (Colorado Springs: Ralph Myles, 1967). (An early article on pedagogy.)
- "Stirner's Critics", *The Philosophical Forum*, volume 8 (1978) pp.66-80. (A partial translation of Stirner's 1845 response to critics, covering his reply to Feuerbach.)
- "Art and Religion", Lawrence S. Stepelevich (edited), *The Young Hegelians. An Anthology* (Cambridge: Cambridge University Press, 1983) pp.327-334. (An article on an eminently Hegelian topic from 1842.)
- *The Ego and Its Own*, edited by David Leopold (Cambridge: Cambridge University Press, 1995). (A well-annotated English edition of Stirner's best-known work.)

Bruno Bauer

Bruno Bauer (1809-1882), philosopher, historian, and theologian. His career falls into two main phases, divided by the revolutions of 1848. In the 1840's, the period known as the Vormärz or the prelude to the German revolutionary events of March 1848, Bauer was a leader of the Left-Hegelian movement, developing a republican interpretation of Hegel, which combined ethical and aesthetic motifs. His theory of infinite self-consciousness, derived from Hegel's account of subjective spirit, stressed rational autonomy and historical progress. Investigating the textual sources of Christianity, Bauer described religion as a form of alienation, which, because of the deficiencies of earthly life, projected irrational, transcendent powers over the self, while sanctioning particularistic sectarian and material interests. He criticized the Restoration state, its social and juridical base, and its orthodox religious ideology. Analyzing the emergence of modern mass society, he rejected liberalism for its inconsequent opposition to the existing order, and for its equation of freedom with property, but he accused socialism of an inadequate appreciation of individual autonomy. After the defeats of 1848, Bauer repudiated Hegel. He predicted a general crisis of European civilization, caused by the exhaustion of philosophy and the failure of liberal and revolutionary politics. New prospects of liberation would, he believed, issue from the crisis. His late writings examined the emergence of Russia as a world power, opening an era of global imperialism and war. These writings influenced Nietzsche's thinking on cultural renewal. Friedrich Engels and Karl Kautsky claimed Bauer's religious criticism for the socialist movement, while the anti-traditionalist conservatism and anti-Semitism of his late work link him to the revolutionary right in the twentieth century.

1. Career

Bauer's family moved from Saxony to Berlin in 1815. At the University of Berlin (1828 -1834), he studied under Hegel, Schleiermacher, and the Hegelians Hotho and Marheineke. His 1829 essay on

Kant's aesthetics won the Prussian royal prize in philosophy, on Hegel's recommendation. From 1834 to 1839, he lectured on theology and biblical texts in Berlin. He was transferred to the theology faculty at Bonn after publishing an attack on his colleague and former teacher Hengstenberg. He taught in Bonn from 1839 till spring 1842, when he was dismissed for the unorthodoxy of his writings on the New Testament. The dismissal followed a consultation by the ministry of education with the theology faculties of the six Prussian universities, but no consensus emerged from the academic inquest. The order for Bauer's dismissal came directly from the king of Prussia, Friedrich Wilhelm IV, who had decreed the suspension from state employment of participants in a banquet to honour the South German liberal Karl Welcker, held in Berlin in 1841. On that occasion, Bauer had proposed a toast to Hegel's conception of the state.

From 1842 to 1849, Bauer was active in political journalism and historical research on the Enlightenment and the French Revolution. He argued against the emancipation of Prussian Jews in 1842-43, seeing this proposal as a political legitimation of particular religious interests. He was the object of polemical attacks by Marx and Engels in *The Holy Family* (1844) and *The German Ideology* (written in 1845-46). With his brother Edgar, Bauer founded the Charlottenburg Democratic Society in 1848, and stood unsuccessfully for election to the Prussian National Assembly on a platform of popular sovereignty.

Remaining in Prussia after the defeats of 1848-49, Bauer continued to produce work of biblical criticism and political analysis. He wrote in the mid 1850's for *Die Zeit*, a government-sponsored newspaper, in which his anti-liberalism took a conservative turn. He contributed articles on European affairs to other newspapers, such as *Die Post*, the *Kleines Journal*, and the *New York Daily Tribune*. From 1859-66 he collaborated with F.W.H. Wagener on his conservative *Staats- und Gesellschafts-Lexikon*, editing almost all 23 volumes, and writing numerous articles, several with anti-Semitic themes. In 1865 he acquired a small farm in Rixdorf, on the outskirts of Berlin. He died there in April 1882.

2. Bauer's Writings, 1829-50

Bauer was a prolific writer, publishing a dozen substantial books and over 60 articles between 1838 and 1848 alone, but no critical edition of these works exists. They included analyses of Hegel, the Bible, modern theologies, the Enlightenment, and the French Revolution and its aftermath. The interpretation of Bauer's work is problematic for several reasons. Because of anonymous, pseudonymous, and collaborative publication, some attributions are disputed; and divergences exist between Bauer's published texts and private correspondence. In the anonymous *Trumpet of the Last Judgement* (1841) and *Hegel's Doctrine of Religion and Art* (1842), Bauer spoke not in his own voice, but in the ironic guise of a conservative critic of Hegel, attributing to Hegel his own revolutionary views.

Three lines of interpretation of Bauer can be distinguished. These focus on his early work; his later writings have attracted little critical attention. The first sees Bauer as a radical subjectivist, whose social and religious criticism was closer to Enlightenment rationalism than to Hegel (Sass, 1978; Brudney, 1998). The second, largely influenced by Marx, insists on Bauer's abandonment of the Hegelian left after 1843 (Rossi, 1974; Pepperle, 1978). The third emphasizes the continuity throughout the Vormärz of

Bauer's thought and of his republicanism, based on the Hegelian idea of the unity of thought and being (Moggach, 2002).

Bauer's prize manuscript of 1829, *De pulchri principiis*, presented the unity of concept and objectivity as the central idea of Hegel's idealism. It examined this unity as expressed in art, comparing Hegel's aesthetic theory to Kant's Third Critique. The manuscript supplemented the criticisms of Kant from Hegel's Berlin Aesthetics lectures with the logical analysis of categories provided by the 1827 *Encyclopaedia of the Philosophical Sciences*. Bauer argued that while the Critique of Judgement attempted to bridge thought and being, and thus opened the way to Hegel, it reproduced the antinomies characteristic of the first two critiques. Kant's synthesis failed, since he continued to define the concept as merely subjective, and the object as the unknowable thing-in-itself, transcending the cognitive power. Self-consciousness, or the subject of the transcendental unity of apperception, was likewise impervious to cognition from the Kantian standpoint. In Hegel's syllogisms of the idea, objectivity attained rational form, while the concept acquired an explicit, material existence. Beauty, life, and idea were moments in the process which constituted the actuality of reason. As the immediate unity of thought and objectivity, art illustrated the inexhaustible fecundity of the philosophical Idea. The manuscript underlined the opposition of faith and reason in its critique of the religious conceptions of the unity of thought and being. Faith was taken to be inimical to free inquiry, which is the element of reason.

Throughout the 1830's, however, Bauer sought to reconcile thought and being through the idea of rational faith. In *Zeitschrift für spekulative Theologie*, which he edited between 1836 and 1838, and in *Jahrbücher für wissenschaftliche Kritik*, he offered a speculative account of Christian doctrines as exemplifications of logical categories. In the 1838 *Religion of the Old Testament*, Bauer depicted religious experience as a product of self-consciousness. He proposed both a transcendental account, stressing the conditions of possibility of religious experiences, and a phenomenological sequence of their forms: a legalistic subordination to an authoritarian deity in the early books of the Old Testament expressed a merely external relation between God and man, while the messianic consciousness of later books heralded a higher form, the immanence of the universal in the community; but this consciousness could only point up the inadequacy of the law, not yet propose the effective overcoming of estrangement. The texts of the 1830's located the logical structure which, for Bauer, defined the religious consciousness: the immediate identity between particularity, whether of a subject or a community, and the abstract universal, a unity achieved without self-transformation. By 1839, Bauer deduced the political implications of this view: the religious consciousness asserted this immediate identity as a monopolistic, sectarian claim, excluding other particulars from equivalent status. The essence of religion for Bauer was now a hubristic particularism, which also conferred a transcendent status on the universal, as a realm divorced from concrete social relationships. This position received its fullest exposition in Bauer's *Christianity Revealed* (1843). He already sketched this argument in *Herr Dr. Hengstenberg*, of 1839, publicly breaking with orthodox and conservative versions of Christianity, and stressing the discontinuity between Christianity and Judaism. By 1840-41, Bauer would present the emancipated philosophical self-consciousness as opposed to all forms of religious representation. His political radicalism and republicanism were cemented by his recognition of the structural identity between the private interests fostered by the Restoration order, and the monopolistic religious consciousness.

Bauer's political and theoretical radicalization is evidenced in his biblical studies. The series is comprised of *Critique of the Gospel of John* (1840), and the three-volume *Critique of the Synoptic Gospels* (1840-42). Together with his 1838 study of the Old Testament, these volumes criticized the stages of revealed religion, and forms of self-alienated spirit in history. Bauer's critique of John's gospel demonstrated the opposition between the free self-consciousness and the religious spirit. His stated purpose was to restore the Christian principle to its source in creative self-consciousness; he did not yet openly oppose the principle itself, but sought to differentiate it, as a rational idea, from ecclesiastical dogmatism. The positivity of Christianity derived from the abstract understanding, rather than from speculative reason, which led religious experience back to its subjective roots. The rational core of Christianity was the identity of God and man, but theology had built an untenable doctrinal system on this foundation. Speculation now undermined dogma; it was not confirmed by it, as Bauer's mid-1830's articles had maintained. In his correspondence, though not in this text itself, Bauer indicated that this restoration of the Christian principle was also its overthrow, as the unity of universal and particular could now be grasped in more tangible and earthly forms. Christianity was a necessary but now transcended stage in the development of the human spirit, to be supplanted by new expressions of autonomous self-consciousness.

In his critique of the Synoptics, Bauer's object was more openly to negate dogmatic Christianity, mobilized in defence of the absolutist order. The incidents described in the gospels were products of the religious consciousness, rather than factual reports. Bauer's critique of John convinced him that the gospel narrative was a purely literary product, and he now argued that the Synoptics too contained no historically authentic material. Bauer attempted to establish the historical priority of Mark, and the specific elaborations undertaken sequentially by Luke and Matthew. He depicted miracles as fallaciously displaying the immediate causality of the universal in nature, and criticized the naturalistic explanations favoured by theological rationalism. The third volume of the series denied the historicity of Christ. The Christian idea that God and mankind share the same essence appeared as the religious representation of a single empirical individual who assumed the universal power of spirit. Like his contemporaries D.F. Strauss and Ludwig Feuerbach, Bauer understood this synthesis instead as a project immanent in human history. As Bauer's political writings from this period show, he proposed that the assumption of universality, and the transcendence of particular interest, were historical tasks, undertaken by the state and the republican citizenry. In the Synoptics texts, Bauer equated Christianity and feudalism, and defended the freedom and equality of self-consciousness. Religion and the absolutist state were mutually sustaining, sharing the essential features of alienation and repression. Christianity represented the completion of the religious consciousness in pure abstraction, and the dissolution of all ethical bonds. Bauer contended that Judaism presupposed the subordination of nature to religious interests, but still maintained the natural links of kinship and ethnicity. Christianity eliminated this limited *Sittlichkeit* in favour of the purely abstract self, thus perfecting alienation and requiring its definitive resolution.

The political application of self-consciousness can be traced through two texts on the state, also dating from 1840-41. In *The Evangelical State Church of Prussia and Science*, Bauer described the essence of the state as free development. The state was the dialectical agency of historical progress and of the universality of the will, manifesting the capacity to abstract from any given content and express itself in ever new forms. While signalling empirical tendencies which might limit the state's progressive function (the prominence of religious interests, and hesitancy before the social question), Bauer contended that the

genuine state, as the expression of freedom, was in constant transformation. His surface claim was that the Prussian state is such an institution, though his contemporary correspondence belied this view. He defended the 1817 union of the Lutheran and Reformed churches in Prussia as the political overcoming of religious oppositions, whose basis had been eroded by the Enlightenment. Through its (still abstract) grasp of the universal concept of man, against religious particularity, the Enlightenment had transformed religious consciousness into self-consciousness. (This process formed one of the major themes of Bauer's *Christianity Revealed*, along with a critique of French materialism for its inadequate grasp of freedom). The churches were now impotent to perpetuate their own existence without the support of the state. Countering conservative historians like F.J. Stahl, who championed the independence of the churches, Bauer's "The Christian State and Our Times," of 1841, again identified the state as the focus of ethical life. Stahl's position implied a derogation of the spirituality of the state, presenting it an agency of external constraint, to uphold the orthodox ecclesiastical and political order against the flow of history, and to defend a social order governed by irrational privileges and immunities. Bauer denounced not only the Christian state of Friedrich Wilhelm IV, but also the formal *Rechtsstaat*, or liberal constitutionalism. For Bauer, both these positions defined freedom as private interest, religious or economic; but as particularity, these attitudes had to be purged away in the name of a new political order. Bauer maintained that Hegel's view of freedom as universality was far in advance of liberal views, even if the Philosophy of Right was inconsistent or incomplete. This was Bauer's provocative claim at the Welcker banquet of 1841. The elimination of egoistic atomism by moral self-consciousness was the pre-requisite for the republic, or the free state.

The anonymous *Trumpet of the Last Judgement*, or *Posaune* (November, 1841), and its sequel, *Hegel's Doctrine of Religion and Art* (1842), interpreted Hegel as sounding a call for revolution, to bring this state into being. Bauer claimed that the consequences of Hegel's system were the overthrow of church and state; and that Hegel's conservative critics were right to see him as the most dangerous adversary of the Restoration. Written ironically as pietistic denunciations, Bauer's two texts attributed to Hegel a theory of infinite self-consciousness, in which the concept of substance and a transcendent absolute were necessary but self-annulling illusions. Recapitulating the issue in his own voice in 1845, Bauer identified a tension in Hegel's thought between Spinoza and Fichte, between inert, undifferentiated substance and creative form. The *Posaune*, however, argued that the Spinozist moment, though necessary to Hegel's dialectic, was fully assimilated to infinite self-consciousness. In absolute spirit, properly understood, all religious pretensions dissipated, while the absolute itself dissolved into the critical activities of conscious individual subjects. Nothing transcendent remained. Yet, the *Posaune* recognized, Hegel also stressed the concept of substance. Its role had to be accounted for. In its apparent transcendence, substance disciplined the immediate, particular self. This was necessary because, as Hegel argued, particularity cannot be the criterion of theoretical or practical reason; rather, individuals must first internalize substance as a stage in reaching infinite self-consciousness. The undifferentiated, pure universal of substance subsumed all particularity, including the self. This initial, Spinozist moment created an appearance of pantheism in Hegel, which misled interpreters like D. F. Strauss. In Bauer's depiction, however, Hegel proceeded to dissolve substantiality as a power independent of consciousness. This dialectical resolution was not equivalent to renouncing objectivity, but meant that substance, once it had demonstrated to the particular consciousness the need to transcend itself, might not claim an immediate validity either. Forgoing immediacy to substantiality, individuals could then become the organs through which the universal

attained conscious form. By overcoming the dialectical illusion of substance, the unity of concept and objectivity could first be glimpsed. The subject must appear as potentially universal, and the objective must show itself as a purposive order, responding to the subject's striving for rational freedom. This development entailed transforming substance into the record of the acts of conscious spirit, an inner relation of self-consciousness to itself. Subjectivity thus assimilated the principle of universality, which it now contained as its own character, not as something alien to it. But this relation was not confined to an inward experience, since reason must realize itself in the world. The externalization of reason produced a historical sequence, including the forms of alienated life. The stages in this sequence could be grasped as moments in the unfolding unity of thought and being. Bauer described self-consciousness, conceived as an immanent and subjective universality, as the motive force of history, generating historical content by taking up and transforming the given. As Bauer's 1829 manuscript had declared, at stake was not only the subjective realisation of the concept, but the fate of the idea, the unity of thought and being; and this required that the objectivity of the historical process be equally emphasized. This historical and critical idealism, which the Posaune attributes to Hegel, was politically revolutionary: it affirmed the rights of free self-consciousness against any positive institution which could not justify its existence before rational thinking, against state, religion, and social hierarchy.

Bauer used his central concept of infinite self-consciousness, a term taken from Hegel's theory of subjective spirit, to reconfigure the Hegelian absolute, bringing art and philosophy into close proximity, and excluding religion as a form of alienated reason, while recognising its past historical necessity. Bauer insisted on the immanence of the universal in history, as the record of struggles for liberation, and of alienation, which was necessary to discover the meaning of rational autonomy. Bauer's ethical idealism resembles what Kant calls perfectionism, or *Vollkommenheit*, a form of rational heteronomy, one of whose meanings is that action is validated by its contribution to historical progress. Bauer equated perfectionism and autonomy, as an uncompromising commitment to remodel political and social relations and institutions. Subjects acquired autonomy by freeing themselves from particular interests, and by repudiating transcendent universals, religious and political institutions which claimed to be underivable from self-consciousness, and exempt from history. Bauer denounced the *ancien régime* and its Restoration surrogates as a feudal system of tutelage and irrational privileges. Arrogating universality to itself, the authoritarian state which arose over these exclusive particulars thwarted the self-activity of its people, and concealed the source of its authority behind a veil of religious sanctification. Bauer maintained that the state, and not religion, was the principal adversary. Against this order of alienated spirit, he insisted that the decisive political question was the source of the state's authority, whether in tradition and religious sanction, or in the popular will. This question was to be resolved without compromise. Bauer asserted that his objective was not merely political, but social emancipation. The social question, the polarizations and crises of civil society to which Hegel had been alert, could be resolved not by direct appeals to the particular interests of one class, but by a common republican struggle against multiform privilege. The result of this combat would be the attainment of justice in all spheres of social life.

Two texts, dating from late 1842 and early 1843, *The Jewish Question*, and "The Capacity of Present-Day Jews and Christians to Become Free," elaborate Bauer's critique of the religious consciousness and of political reformism. The consequence of their publication, however, was that Bauer forfeited his leading

position in the opposition movement, as he challenged one of its central demands. The question was whether the explicitly Christian state of Prussia could eliminate restrictions on Jewish participation in civil institutions. While liberals and republicans advocated emancipation, conservative opponents defended the state's exclusive confessional allegiance. Bauer's interventions attacked the state for defending privilege, and claimed that it used religion as a mask for its interests in maintaining relations of subordination; but he also criticized Jews and their supporters for claiming freedom on the basis of a particular identity. Political and social freedom required the renunciation of all particularistic ties with the past; thus, as a precondition of juridical equality, Jews must renounce their religious allegiance, as must Christians. Christianity demonstrated a historically higher degree of consciousness, since it cancelled the externality of the deity. But this was not a unilateral progress upon Judaism, because Christianity, and especially Protestantism, universalized alienation to encompass all aspects of life. The superiority of Christianity consisted in its radical negativity, making requisite a transition to a new and higher form of ethical life. By exacerbating the contradiction between self-determination and self-abasement, the way was cleared for an epochal resolution. These interventions were censured by Marx, and by leading liberal spokesmen. Bauer remained adamant that his position was the correct progressive stance.

In his studies of the French Revolution and its impact on Germany, Bauer traced the emergence of mass society, based on conformity and inchoate particularism. The dissolution of the feudal estates by the Revolution produced a purely atomistic society, characterized by the assertion of individual property right. The attachment to private economic interest made impossible a concerted opposition to privilege and to the existing order, and had caused the ultimate defeat of the revolutions that had spawned it. Jacobinism, which Bauer in many ways endorsed, had been directed against this attitude, but had failed to overcome it; and it now threatened the republican movement of the Vormärz. The masses, encompassing both the proletariat and the bourgeoisie, represented inertia and stagnation, and formed the bulwark of the existing order. Their opposition to it was merely apparent. Liberalism unconsciously expressed this development of mass society, defining freedom as acquisition. Bauer criticized liberal constitutionalism as a vacillating, compromising attitude toward the feudal regime. Even in its most advanced form, that endorsed by Hegel, constitutionalism juxtaposed two diametrically opposed principles of sovereignty, popular and princely, and was unable to resolve the contention between them. Incipient socialism shared the same terrain as liberalism, the defence of private interest, but proposed inconsequent and unacceptable solutions to the conditions which liberalism simply affirmed. For Bauer, socialism was irredeemably heteronomous. The socialist movement, he claimed, sought to organize the workers in their immediate, particular existence, and not to transform them. He saw in the proletariat pure particularity, and, unlike Marx, denied that this particularity could transform itself into a genuine universal unless it first renounced its own sectional interests. Bauer also anticipated the negative effects of a socialist organization of labour. While criticizing capitalism for its irrational competitive forms, he defended the principle of competition itself as a necessary condition for progress, the independence of persons, and the possibility of conscious, free self-determination. Bauer's pre-1848 work revived the classical republican themes of the opposition of commerce and virtue, but gave them a new shape, consistent with his Hegelianism. In 1842-43, Bauer confidently predicted the triumph of republican principles and institutions, though this confidence waned as the political crisis deepened. In his two electoral addresses of 1848-49, he defended popular sovereignty and the right of revolution, demanding that the new constitution be promulgated as an act of revolutionary will, and not received as a concession from the king.

3. Bauer’s Late Work, 1850-1882

While he continued to proclaim the continuity of his thought, Bauer’s late work was characterized by the definitive abandonment of his Vormärz republicanism. The failure of 1848, he argued, demonstrated the bankruptcy of the European philosophical tradition. Instead of the triumph of republics, Bauer now foresaw an age of global imperialism. The decisive political question after 1848 was the rise of Russia. Bauer predicted that Russian pressure would promote a pan-European union, as a stage in a movement toward a global absolutism. The revolutionaries of 1848 still presupposed, uncritically, that states were independent units. The next historical period would initiate a genuine continental crisis. Anticipating Nietzsche, Bauer contended that the impending collapse of European civilisation would make possible a new beginning, a liberation from traditional forms and values, together with their metaphysical and religious sanctions. Bauer’s abiding opposition to liberalism now induced him to collaborate in conservative causes; but his conservatism was unconventional. Like Nietzsche, he continued to repudiate tradition and religion. Because of his anti-Semitism, Bauer was claimed as a precursor by some National-Socialist authors, though Ernst Barnikol, for example, disputes a direct connection (Barnikol 1972, pp. 350-53).

For Bauer, the revolutions of 1848 were so closely connected with the Enlightenment, Kantian, and Hegelian projects that their failure sounded the death-knell of philosophy and its claims to rational individual autonomy. Bauer’s late critique assimilated Hegel with Spinoza and the metaphysics of substance, understood as the negation of form and subjectivity. Unlike his Vormärz position, he asserted in texts of 1852 and 1853 that Hegel had yielded to the influence of Spinoza, effacing individuality, and submerging concrete particulars under illusory, abstract logical categories. Bauer now described the Hegelian idea as a transcendent illusion. Its inability to admit concrete particulars derived from the substantiality of the system itself. The result was that Hegel had discounted individuality in favour of conformity. While prior to 1848 Bauer proclaimed that Hegel had taught "the republic and the revolution," he now decried the absolutist tendencies of the Hegelian system, whose oppressive unity paralleled the historical trend toward an all-encompassing political despotism. Bauer accused philosophy of contributing to an inexorable process of levelling and uniformity in the post-revolutionary state (Bauer, *Russland und das Germanenthum*, I, pp. 40-54). These criticisms anticipated Rudolph Haym’s polemic in *Hegel und seine Zeit* (1857).

In common with many post-1848 intellectuals, Bauer’s abandonment of metaphysics led him to a new conception of critique as a positive science or empirical investigation. Bauer no longer contended that history represents an unfolding dialectic of self-consciousness. Critique was to permit the observer to examine historical phenomena without distortion or partiality, and without an a priori systemic concern. Bauer maintained that scientific research must remain independent of ecclesiastical and political tutelage. Its objective was to determine the relation of nature to rights and freedom of the will (concepts which the late Bauer retained, while rejecting their metaphysical foundations); but critique did not enjoin practical intervention in political affairs. The correct stance was now disinterested contemplation of the inevitable processes of cultural decay and regeneration.

The conclusion of this new critique was that the future belonged not to the republican people, or to separate peoples, but to a transnational imperialism, involving the confrontation of two absolutist programmes. In one of these, the Western European, political absolutism arose over modern mass society as its necessary complement. Bauer had earlier criticized this configuration as an outmoded form of state, to be supplanted by the republic; it now described the result of an incomplete political development, which would issue in a contention for world domination. Within the Western European form, Bauer distinguished two variants: Bismarck's state socialism, imitating eighteenth-century Prussian militarism, attempted to subject economic production to political control, suppressing innovation and personal independence; Disraeli's romantic imperialism sought to level and subordinate English society before a paternalistic monarchy. In opposition to the west, the second major absolutist form was that of Russia, a substantial power with limited internal distinctions. Its cohesiveness derived from the fusion of political and ecclesiastical power, and the absence of the modern idea of subjectivity. Bauer noted that Hegel had mistakenly discounted this zone from world history. Like the anarchist Michael Bakunin, Bauer claimed that Russia owed its original state formation to Germany; but Russia had otherwise been impervious to western philosophical influence, adopting only what served its immediate, concrete ends. Animated by hatred and shame of its past insignificance, Russia too was ambivalent. It did not directly provide the solution to the contemporary political crisis, but elicited the decisive struggle with the west. The vigour of an alien adversary would force Europe to transform itself. This process involved the extension of imperialism across the continent and the globe, and the clash of rivals for dominance within the new empire. World war was inevitable.

Bauer's prognosis anticipated aspects of Karl Kautsky's 1915 theory of ultraimperialism, though without the latter's optimism that this trend heralded a reduction in conflicts among contenders for hegemony. Imperialism, moreover, did not stimulate, but hampered economic growth, since insecurity and permanent military mobilization undermined productive activity. The historic function of the globalizing process was to eliminate national identities, laying the basis for an eventual cosmopolitan rebirth. Bauer saw nationalism as a dissipated force. The emerging world order was framed not by the defence of national interests, but by a struggle for transnational supremacy among elites with no local loyalties. The growing centralization of political power was abetted by the levelling forces of the socialist movement, with its own internationalist pretensions. This trend also underlay what Bauer called political pauperism, a generalised disqualification of individuals from participation in political activity. The conclusion of this process would be to perfect mass society, which Bauer had analyzed since the 1840's. The principle of substance, non-differentiation, and conformity would reach its ultimate extension, and could then be overthrown. World imperialism would issue in an all-embracing catastrophe, the apocalyptic end of the old, Christian-Germanic order. Only then would new cultural possibilities emerge. Though these could not be predicted in detail, they would involve the emergence of an unprecedented creative individuality, freed from religious and metaphysical illusions.

Bauer likened the present crisis to the end of the classical world in Roman imperialism. His studies in the 1850's located the origins of Christianity in the second century A.D., concluding that the first gospel was written under Hadrian (117-138 AD), though slightly predated by some of the Pauline epistles. Bauer traced the evolution of Christian ideas from Hellenism and Stoicism, deriving the logos doctrine of John's gospel from Philo and neo-Platonic sources. As in *Herr Dr. Hengstenberg*, he denied that Christianity

had emerged directly from Judaism. More than in his early work, though, he now stressed the revolutionary power of the early Christian religion, as a source of liberation for the excluded and impoverished elements of the Roman Empire. His final book described Christianity as the socialist culmination of Greek and Roman history. Responding to this argument in his very positive obituary of Bauer, Friedrich Engels acknowledged the importance of Bauer's late work for the socialist critique of religion (*Sozialdemokrat*, 1882). In 1908, Karl Kautsky's book, *The Origins of Christianity*, applied Bauer's thesis.

Bauer's late writings identified sentiment and pietistic feeling-certainty, rather than autonomous reason, as the principal force in shaping modern subjectivity. His studies of the Quakers and of pietism described passive inwardness and feeling as the dominant characteristics of the German Enlightenment. The practical reason of Kant and Fichte merely translated the inner voice of pietist conscience into a rationalist idiom. Bauer also described pietism as the end of Christianity, since it destroyed dogma in favour of inner illumination and personal moral rectitude. Consistent with his *Christianity Revealed*, Bauer continued to define positive or statutory religions by their exclusive dogmas and symbols; and he still saw the general course of history as dissipating these dogmas as mere illusions. He discounted the mobilizing potential of religion in the modern imperial order. In the Posaune, he had denounced Schleiermacher's efforts to restore dogmatic Christianity through an appeal to feelings of dependency. Now he claimed that the force of sentiment, contrary to Schleiermacher's supposition, was to dissolve dogmatic religion into personal conviction. The new world empire would end with the inner erosion of religious belief. Not rational speculation, but sentiment, would effect this transformation.

A stringent anti-nationalism and a marked anti-Semitism characterized Bauer's later thought. He defended German culture against its political appropriation by the Prussian and Austrian regimes, but criticized its insufficiencies, in Goethe, for example, who remained enthralled to the metaphysical tradition. Bauer stressed that Germany was not a racial unit, but a historical and cultural artefact, reinforced by racial mixing, and not by racial purity (Barnikol 1972, p. 393). It is clear, however, that some elements were excluded from the mix: unlike his earlier treatment of the Jewish question as historical, cultural, and religious, he now asserted that a natural distinction of race created an impassable divide between Jews and Europeans (Bauer, "Present Position of the Jews," 1852). His claim that the political significance of the Jews throughout the political spectrum was a testimony to the debility of European culture and to the approaching crisis was greeted by National-Socialist authors.

Bauer's late work contains prescient observations on globalization and world war, and has affinities with a variety of twentieth-century ideological forms, from socialism to imperialism and anti-Semitism. In contrast, his early work bespeaks an original, Hegelian republicanism, and offers cogent analyses of Restoration political thought and the rise of mass society. His intellectual legacy is complex and contentious.

Bibliography

Major Works by Bruno Bauer, 1829-1882

- *De pulchri principiis*. Prussian royal prize manuscript, University of Berlin,1829. First published as *Über die Prinzipien des Schönen. De pulchri principiis. Eine Preisschrift*, hrsg. Douglas Moggach und Winfried Schultze, mit einem Vorwort von Volker Gerhardt (Berlin: Akademie Verlag, 1996)
- "Rezension: *Das Leben Jesu, kritisch bearbeitet* von David Friedrich Strauss," *Jahrbücher für wissenschaftliche Kritik*, Dec. 1835, no. 109, 879-880; no. 111, 891; no. 113, 905-912. May 1836, no. 86, 681-688; no. 88, 697-704.
- *Kritik der Geschichte der Offenbarung. Die Religion des alten Testaments in der geschichtlichen Entwicklung ihrer Prinzipien dargestellt*, 2 vol. (Berlin, 1838).
- *Herr Dr. Hengstenberg* (Berlin, 1839)
- (anon., 1st ed.) *Die evangelische Landeskirche Preußens und die Wissenschaft* (Leipzig, 1840); second edition, with author indicated, 1840.
- *Kritik der evangelischen Geschichte des Johannes* (Bremen, 1840).
- "Der christliche Staat und unsere Zeit," *Hallische Jahrbücher für deutsche Wissenschaft und Kunst*, 7 - 12 June 1841, no 135-140, pp. 537-558.
- *Kritik der evangelischen Geschichte der Synoptiker*, 2 vol. (Leipzig, 1841); *Kritik der evangelischen Geschichte der Synoptiker und des Johannes, Dritter und letzter Band* (Braunschweig, 1842)
- (anon.) *Die Posaune des jüngsten Gerichts über Hegel den Atheisten und Antichristen. Ein Ultimatum* (Leipzig,1841); *The Trumpet of the Last Judgement against Hegel the Atheist and Antichrist. An Ultimatum*, trans. L. Stepelevich (Lewiston, N.Y.: E. Mellen Press, 1989)
- (anon.) *Hegels Lehre von der Religion und Kunst von dem Standpuncte des Glaubens aus beurtheilt* (Leipzig, 1842); new edition Aalen: Scientia Verlag, 1967
- *Die gute Sache der Freiheit und meine eigene Angelegenheit* (Zürich und Winterthur, 1842)
- *Die Judenfrage* (Braunschweig, 1843).
- articles in Arnold Ruge (ed.), *Anekdota zur neuesten deutschen Philosophie und Publizistik*, vol. 2 (Zürich und Winterthur, 1843): "Leiden und Freuden des theologischen Bewußtseins", 89-112; "Rezension: 'Bremisches Magazin für evangelische Wahrheit gegenüber dem modernen Pietismus. Erstes Heft'", 113-134; "Rezension: *Einleitung in die Dogmengeschichte* von Theodor Kliefoth."135-159; "Rezension: *Die Geschichte des Lebens Jesu mit steter Rücksicht auf die vorhandenen Quellen* dargestellt von Dr. von Ammon. Leipzig, 1842" 160-185.
- *Das entdeckte Christenthum. Eine Erinnerung an das 18. Jahrhundert und ein Beitrag zur Krisis des 19*. (Zürich und Winterthur, 1843)
- "Die Fähigkeit der heutigen Juden und Christen, frei zu werden," in Georg Herwegh (ed.), *Einundzwanzig Bogen aus der Schweiz* (Zürich und Winterthur, 1843), 56-71.
- *Geschichte der Politik, Kultur und AufklÄrung des achtzehnten Jahrhunderts*, 4 vols. (Charlottenburg: 1843-45).
- *Denkwürdigkeiten zur Geschichte der neueren Zeit seit der französischen Revolution* (Charlottenburg, 1843-1844).
- *Briefwechsel zwischen Bruno Bauer und Edgar Bauer während der Jahre 1839-1842 aus Bonn und Berlin* (Charlottenburg, 1844).
- "Was ist jetzt der Gegenstand der Kritik?" *Allg. Lit-Ztg*. VIII, July 1844, 18-26.

- "Die Gattung und die Masse", *Allg. Lit.-Ztg.* X, September 1844, 42-48.
- *Acktenstücke zu den Verhandlungen über die Beschlagnahme der "Geschichte der Politik, Kultur und Aufklärung des achtzehnten Jahrhunderts",* von Bruno Bauer. Teil I herausgegeben von Bruno Bauer (Christiania: Verlag von C.C. Werner, 1844).
- "Charakteristik Ludwig Feuerbachs," *Wigands Vierteljahrschrift* III, 1845, 86-146.
- *Geschichte Deutschlands und der französischen Revolution unter der Herrschaft Napoleons*, 2 vols. (Charlottenburg, 1846)
- *Vollständige Geschichte der Parteikämpfe in Deutschland während der Jahre 1842-1846* (Charlottenburg, 1847).
- *Die bürgerliche Revolution in Deutschland seit dem Anfange der deutschkatholischen Bewegung* (Charlottenburg, 1847)
- "Erste Wahlrede von 1848," and "Verteidigungsrede Bruno Bauers vor den Wahlmännern des Vierten Wahlbezirkes am 22.2. 1849," in E. Barnikol, *Bruno Bauer: Studien und Materialien*, 518-531.
- *Untergang des Frankfurter Parlaments* (Charlottenburg, 1849).
- *Kritik der paulinischen Briefe* (Berlin, 1850-1851).
- *Kritik der Evangelien und Geschichte ihres Ursprungs*, 3 vol. (Berlin, 1850-1851); 4th vol. under the title *Die theologische Erklärung der Evangelien* (Berlin, 1852).
- "The Present Position of the Jews," *New York Daily Tribune*, June 7, 1852.
- *Russland und das Germanenthum*, 2 vol. (Charlottenburg, 1853).
- *De la dictature occidentale* (Charlottenburg, 1854).
- *Deutschland und das Russenthum* (Charlottenburg, 1854).
- *Die russische Kirche. Schlussheft* (Charlottenburg, 1855).
- *Das Judenthum in der Fremde. Separat-Abdruck aus dem Wagener'schen Staats- und Gesellschaftslexikon* (Berlin, 1863).
- *Freimaurer, Jesuiten und Illuminaten in ihrem geschichtlichen Zusammenhange* (Berlin, 1863).
- *Philo, Strauss und Renan und das Urchristenthum* (Berlin, 1874).
- *Einfluss des englischen Quäkerthums auf die deutsche Cultur und auf das englisch-russische Project einer Weltkirche* (Berlin, 1878).
- *Christus und die Cäsaren. Der Ursprung des Christenthums aus dem römischen Griechenthum* (Berlin, 1879).
- *Zur Orientierung über die Bismarck'sche Ära* (Chemnitz, 1880).
- *Disraelis romantischer und Bismarcks socialistischer Imperialismus* (Chemnitz,1882).

Journals edited by Bruno Bauer

- *Zeitschrift für spekulative Theologie* (Berlin, three volumes,1836-1838).
- *Allgemeine Literatur-Zeitung* (Charlottenburg, 12 issues December 1843-October 1844). Second edition under the title: *Streit der Kritik mit den modernen Gegensätzen* (Charlottenburg, 1847).
- *Norddeutsche Blätter. Eine Monatschrift für Kritik, Literatur und Unterhaltung* (Charlottenburg. 10 issues July 1844 - April 1845). Second edition under the title: *Beiträge zum Feldzuge der Kritik. Norddeutsche Blätter für 1844 und 1845* (Berlin, 1846).
- collaboration in Friedrich Wilhelm Hermann Wagener, ed., *Neues Conversations-Lexikon. Staats-*

und Gesellschafts-Lexikon, 23 vol. (Berlin, 1859-1867).
- collaboration in *Schmeitzner's Internationale Monatsschrift. Zeitschrift für allgemeine nationale Kultur und deren Literatur* (Chemnitz, 1882).

Conventionality of Simultaneity

In his first paper on the special theory of relativity, Einstein indicated that the question of whether or not two spatially separated events were simultaneous did not necessarily have a definite answer, but instead depended on the adoption of a convention for its resolution. Some later writers have argued that Einstein's choice of a convention is, in fact, the only possible choice within the framework of special relativistic physics, while others have maintained that alternative choices, although perhaps less convenient, are indeed possible.

The Conventionality Thesis

Prior to Einstein's first paper on relativity (Einstein, 1905), it was generally agreed that simultaneity was absolute; i.e., that there was a unique event at location A that was simultaneous with a given event at location B. Einstein, however, said that it was necessary to make an assumption in order to be able to compare the times of occurrence of events at spatially separated locations (Einstein, 1905, pp. 38-40 of the Dover translation or pp. 125-127 of the Princeton translation; but note Scribner, 1963, for correction of an error in the Dover translation). His assumption, which defined what is usually called standard synchrony, can be described in terms of the following idealized thought experiment, where the spatial locations A and B are fixed locations in some particular, but arbitrary, inertial (i.e., unaccelerated) frame of reference: Let a light ray, traveling in vacuum, leave A at time t_1 (as measured by a clock at rest there), and arrive at B coincident with the event E at B. Let the ray be instantaneously reflected back to A, arriving at time t_2. Then standard synchrony is defined by saying that E is simultaneous with the event at A that occurred at time $(t_1 + t_2)/2$. This definition is equivalent to the requirement that the one-way

speeds of the ray be the same on the two segments of its round-trip journey between A and B.

The thesis that the choice of standard synchrony is a convention, rather than one necessitated by facts about the physical universe (within the framework of the special theory of relativity), has been argued particularly by Reichenbach (see, for example, Reichenbach, 1958, pp. 123-135) and Grünbaum (see, for example, Grünbaum, 1973, pp. 342-368). They argue that the only nonconventional basis for claiming that two distinct events are not simultaneous would be the possibility of a causal influence connecting the events. In the pre-Einsteinian view of the universe, there was no reason to rule out the possibility of arbitrarily fast causal influences, which would then be able to single out a unique event at A that would be simultaneous with E. In an Einsteinian universe, however, no causal influence can travel faster than the speed of light in vacuum, so from the point of view of Reichenbach and Grünbaum, any event at A whose time of occurrence is in the open interval between t_1 and t_2 could be defined to be simultaneous with E. In terms of the ε-notation introduced by Reichenbach, any event at A occurring at a time $t_1 + \varepsilon(t_2 - t_1)$, where $0 < \varepsilon < 1$, could be simultaneous with E. That is, the conventionality thesis asserts that any particular choice of ε within its stated range is a matter of convention, including the choice $\varepsilon=1/2$ (which corresponds to standard synchrony). If ε differs from 1/2, the one-way speeds of a light ray would differ (in an ε-dependent fashion) on the two segments of its round-trip journey between A and B. If, more generally, we consider light traveling on an arbitrary closed path in three-dimensional space, then (as shown by Minguzzi, 2002, pp.155-156) the freedom of choice in the one-way speeds of light amounts to the choice of an arbitrary scalar field (although two scalar fields that differ only by an additive constant would give the same assignment of one-way speeds).

It might be argued that the definition of standard synchrony makes use only of the relation of equality (of the one-way speeds of light in different directions), so that simplicity dictates its choice rather than a choice that requires the specification of a particular value for a parameter. Grünbaum (1973, p. 356) rejects this argument on the grounds that, since the equality of the one-way speeds of light is a convention, this choice does not simplify the postulational basis of the theory but only gives a symbolically simpler representation.

Phenomenological Counterarguments

Many of the arguments against the conventionality thesis make use of particular physical phenomena, together with the laws of physics, to establish simultaneity (or, equivalently, to measure the one-way speed of light). Salmon (1977), for example, discusses a number of such schemes and argues that each makes use of a nontrivial convention. For instance, one such scheme uses the law of conservation of momentum to conclude that two particles of equal mass, initially located halfway between A and B and then separated by an explosion, must arrive at A and B simultaneously. Salmon (1977, p. 273) argues, however, that the standard formulation of the law of conservation of momentum makes use of the concept of one-way velocities, which cannot be measured without the use of (something equivalent to) synchronized clocks at the two ends of the spatial interval that is traversed; thus, it is a circular argument to use conservation of momentum to define simultaneity.

It has been argued (see, for example, Janis, 1983, pp. 103-105, and Norton, 1986, p. 119) that all such schemes for establishing convention-free synchrony must fail. The argument can be summarized as follows: Suppose that clocks are set in standard synchrony, and consider the detailed space-time description of the proposed synchronization procedure that would be obtained with the use of such clocks. Next suppose that the clocks are reset in some nonstandard fashion (consistent with the causal order of events), and consider the description of the same sequence of events that would be obtained with the use of the reset clocks. In such a description, familiar laws may take unfamiliar forms, as in the case of the law of conservation of momentum in the example mentioned above. Indeed, all of special relativity has been reformulated (in an unfamiliar form) in terms of nonstandard synchronies (Winnie, 1970a and 1970b). Since the proposed synchronization procedure can itself be described in terms of a nonstandard synchrony, the scheme cannot describe a sequence of events that is incompatible with nonstandard synchrony. A comparison of the two descriptions makes clear what hidden assumptions in the scheme are equivalent to standard synchrony.

Transport of Clocks

A phenomenological scheme that deserves special mention, because of the amount of attention it has received over the course of many years, is to define synchrony by the use of clocks transported between locations A and B in the limit of zero velocity. Eddington (1924, p. 15) discusses this method of synchrony, and notes that it leads to the same results as those obtained by the use of electromagnetic signals (the method that has been referred to here as standard synchrony). He comments on both of these methods as follows (1924, pp. 15-16): "We can scarcely consider that either of these methods of comparing time at different places is an essential part of our primitive notion of time in the same way that measurement at one place by a cyclic mechanism is; therefore they are best regarded as conventional."

One objection to the use of the slow-transport scheme to synchronize clocks is that, until the clocks are synchronized, there is no way of measuring the one-way velocity of the transported clock. Bridgman (1962, p. 26) uses the "self-measured" velocity, determined by using the transported clock to measure the time interval, to avoid this problem. Using this meaning of velocity, he suggests (1962, pp. 64-67) a modified procedure that is equivalent to Eddington’s, but does not require having started in the infinite past. Bridgman would transport a number of clocks from A to B at various velocities; the readings of these clocks at B would differ. He would then pick one clock, say the one whose velocity was the smallest, and find the differences between its reading and the readings of the other clocks. Finally, he would plot these differences against the velocities of the corresponding clocks, and extrapolate to zero velocity. Like Eddington, Bridgman does not see this scheme as contradicting the conventionality thesis. He says (1962, p.66), "What becomes of Einstein’s insistence that his method for setting distant clocks -- that is, choosing the value 1/2 for ε -- constituted a ‘definition’ of distant simultaneity? It seems to me that Einstein’s remark is by no means invalidated."

Ellis and Bowman (1967) take a different point of view. Their means of synchronizing clocks by slow

transport (1967, pp. 129-130) is again somewhat different from, but equivalent to, those already mentioned. They would place clocks at A and B with arbitrary settings. They would then place a third clock at A and synchronize it with the one already there. Next they would move this third clock to B with a velocity they refer to as the "intervening ‘velocity’", determined by using the clocks in place at A and B to measure the time interval. They would repeat this procedure with decreasing velocities and extrapolate to find the zero-velocity limit of the difference between the readings of the clock at B and the transported clock. Finally, they would set the clock at B back by this limiting amount. On the basis of their analysis of this procedure, they argue that, although consistent nonstandard synchronization appears to be possible, there are good physical reasons (assuming the correctness of empirical predictions of the special theory of relativity) for preferring standard synchrony. Their conclusion (as summarized in the abstract of their 1967, p. 116) is, "The thesis of the conventionality of distant simultaneity espoused particularly by Reichenbach and Grünbaum is thus either trivialized or refuted."

A number of responses to these views of Ellis and Bowman (see, for example, Grünbaum et al., 1969; Winnie, 1970b, pp. 223-228; and Redhead, 1993, pp. 111-113) argue that nontrivial conventions are implicit in the choice to synchronize clocks by the slow-transport method. For example, Grünbaum (Grünbaum et al., 1969, pp. 5-43) argues that it is a nontrivial convention to equate the time interval measured by the infinitely slowly moving clock traveling from A to B with the interval measured by the clock remaining at A and in standard synchrony with that at B, and the conclusion of van Fraassen (Grünbaum et al., 1969, p. 73) is, "Ellis and Bowman have not proved that the standard simultaneity relation is nonconventional, which it is not, but have succeeded in exhibiting some *alternative conventions* which also yield that simultaneity relation." Winnie (1970b), using his reformulation of special relativity in terms of arbitrary synchrony, shows explicitly that synchrony by slow-clock transport agrees with synchrony by the standard light-signal method when both are described in terms of an arbitrary value of ε within the range $0 < \varepsilon < 1$, and argues that Ellis and Bowman err in having assumed the $\varepsilon=1/2$ form of the time-dilation formula in their arguments. He concludes (Winnie, 1970b, p. 228) that "it is not possible that the method of slow-transport, or any other synchrony method, could, within the framework of the *nonconventional* ingredients of the Special Theory, result in fixing *any* particular value of ε to the exclusion of any other particular values." Redhead (1993) also argues that slow transport of clocks fails to give a convention-free definition of simultaneity. He says (1993, p. 112), "There is no absolute factual sense in the term ‘slow.’ If we estimate ‘slow’ relative to a moving frame K’, then slow-clock-transport will pick out standard synchrony in K’, but this ... corresponds to nonstandard synchrony in K."

An alternative clock-transport scheme, which avoids the issue of slowness, is to have the clock move from A to B and back again (along straight paths in each direction) with the same self-measured speed throughout the round trip (Mamone Capria, 2001, pp. 812-813; as Mamone Capria notes, his scheme is similar to those propoosed by Brehme, 1985, pp. 57-58, and 1988, pp. 811-812). If the moving clock leaves A at time t_1 (as measured by a clock at rest there), arrives at B coincident with the event E at B, and arrives back at A at the time t_2, then standard synchrony is obtained by saying that E is simultaneous with the event at A that occurred at the time $(t_1 + t_2)/2$. It would seem that this transport scheme is sufficiently similar to the slow-transport scheme that it could engender much the same debate, apart from

those aspects of the debate that focussed specifically on the issue of slowness.

Malament's Theorem

An entirely different sort of argument against the conventionality thesis has been given by Malament (1977), who argues that standard synchrony is the only simultaneity relation that can be defined, relative to a given inertial frame, from the relation of (symmetric) causal connectibility. Let this relation be represented by κ, let the statement that events p and q are simultaneous be represented by S(p,q), and let the given inertial frame be specified by the world line, O, of some inertial observer. Then Malament's uniqueness theorem shows that if S is definable from κ and O, if it is an equivalence relation, if points p on O and q not on O exist such that S(p,q) holds, and if S is not the universal relation (which holds for all points), then S is the relation of standard synchrony.

Some commentators have taken Malament's theorem to have settled the debate on the side of nonconventionality. For example, Torretti (1983, p. 229) says, "Malament proved that simultaneity by standard synchronism in an inertial frame F is the *only* non-universal equivalence between events at different points of F that is definable ('in any sense of "definable" no matter how weak') in terms of causal connectibility alone, for a given F"; and Norton (Salmon et al., 1992, p. 222) says, "Contrary to most expectations, [Malament] was able to prove that the central claim about simultaneity of the causal theorists of time was false. He showed that the standard simultaneity relation was the only nontrivial simultaneity relation definable in terms of the causal structure of a Minkowski spacetime of special relativity."

Other commentators disagree with such arguments, however. Grünbaum (as reported by Norton in Salmon et al., 1992, p. 226) and Redhead (1993, p.114) cite Malament's need to postulate that S is an equivalence relation as a weakness in the argument. Havas (1987, p. 444) says, "What Malament has shown, in fact, is that in Minkowski space-time ... one can always introduce time-orthogonal coordinates ..., an obvious and well-known result which implies ε=1/2." Janis (1983, pp. 107-109) argues that Malament's theorem leads to a unique (but different) synchrony relative to any inertial observer, that this latitude is the same as that in introducing Reichenbach's ε, and thus Malament's theorem should carry neither more nor less weight against the conventionality thesis than the argument (mentioned above in the last paragraph of the first section of this article) that standard synchrony is the simplest choice. Similarly, Redhead (1993, p. 114) says that "we can use the same argument as we did for slow-clock-transport to demonstrate that we are faced with a conventional choice betweeen standard synchronies defined à la Malament in all possible inertial frames." In a comprehensive review of the problem of the conventionality of simultaneity, Anderson, Vetharaniam, and Stedman (1998, pp. 124-125) claim that Malament's proof is erroneous. Although they appear to be wrong in this claim, the nature of their error highlights the fact that Malament's proof, which uses the time-symmetric relation κ, would not be valid if a temporal orientation were introduced into space-time (see, for example, Spirtes, 1981, Ch. VI, Sec. F; and Stein, 1991, p. 153n).

Sarkar and Stachel (1999) argue that there is no physical warrant for the requirement that a simultaneity

relation be invariant under temporal reflections. Dropping that requirement, they show that Malament's other criteria for a simultaneity relation are then also satisfied if we fix some arbitrary event in space-time and say either that any pair of events on its backward null cone are simultaneous or, alternatively, that any pair of events on its forward null cone are simultaneous. They show further that, among the relations satisfying these requirements, standard synchrony is the unique such relation that is independent of the position of an observer and the half-null-cone relations are the unique such relations that are independent of the motion of an observer. If the backward-cone relation were chosen, then simultaneous events would be those seen simultaneously by an observer at the cone's vertex. As Sarkar and Stachel (1999, p. 209) note, Einstein (1905, p. 39 of the Dover translation or p. 126 of the Princeton translation) considered this possibility and rejected it because of its dependence on the position of the observer. Since the half-null-cone relations define causally connectible events to be simultaneous, it would seem that they would also be rejected by adherents of the views of Reichenbach and Grünbaum.

Giulini (2001, p.653) argues that it is too strong a requirement to ask that a simultaneity relation be invariant under causal transformations (such as scale transformations) that are not physical symmetries, which Malament as well as Sarkar and Stachel do. Using "Aut" to refer to the appropriate invariance group and "nontrivial" to refer to an equivalence relation on spacetime that is neither one in which all points are in the same equivalence class nor one in which each point is in a different equivalence class, Giulini (2001, pp. 657-658) defines two types of simultaneity: Absolute simultaneity is a nontrivial Aut-invariant equivalence relation on spacetime such that each equivalence class intersects any physically realizable timelike trajectory in at most one point, and simultaneity relative to some structure X in spacetime (for Malament, X is the world line of an inertial observer) is a nontrivial Aut_X-invariant equivalence relation on spacetime such that each equivalence class intersects any physically realizable timelike trajectory in at most one point, where Aut_X is the subgroup of Aut that preserves X. First taking Aut to be the inhomogeneous (i.e., including translations) Galilean transformations, Giulini (2001, pp. 660-662) shows that standard Galilean (i.e., pre-relativistic) simultaneity is the unique absolute simultaneity relation. Then taking Aut to be the inhomogeneous Lorentz tansformations (also known as the Poincaré transformations), Giulini (2001, pp. 664-666) shows that there is no absolute simultaneity relation and that standard Einsteinian synchrony is the unique relative simultaneity when X is taken to be a foliation of spacetime by straight lines (thus, like Malament, singling out a specific inertial frame, but in a way that is different from Malament's choice of X).

Other Considerations

Since the conventionality thesis rests upon the existence of a fastest causal signal, the existence of arbitrarily fast causal signals would undermine the thesis. If we leave aside the question of causality, for the moment, the possibility of particles (called tachyons) moving with arbitrarily high velocities is consistent with the mathematical formalism of special relativity (see, for example, Feinberg, 1967). Just as the speed of light in vacuum is an upper limit to the possible speeds of ordinary particles (sometimes called bradyons), it would be a lower limit to the speeds of tachyons. When a transformation is made to a different inertial frame of reference, the speeds of both bradyons and tachyons change (the speed of light in vacuum being the only invariant speed). At any instant, the speed of a bradyon can be transformed to

zero and the speed of a tachyon can be transformed to an infinite value. The statement that a bradyon is moving forward in time remains true in every inertial frame (if it is true in one), but this is not so for tachyons. Feinberg (1967) argues that this does not lead to violations of causality through the exchange of tachyons between two uniformly moving observers because of ambiguities in the interpretation of the behavior of tachyon emitters and absorbers, whose roles can change from one to the other under the transformation between inertial frames. He claims to resolve putative causal anomalies by adopting the convention that each observer describes the motion of each tachyon interacting with that observer's apparatus in such a way as to make the tachyon move forward in time. However, all of Feinberg's examples involve motion in only one spatial dimension. Pirani (1970) has given an explicit two-dimensional example in which Feinberg's convention is satisfied but a tachyon signal is emitted by an observer and returned to that observer at an earlier time, thus leading to possible causal anomalies.

A claim that no value of ε other than 1/2 is mathematically possible has been put forward by Zangari (1994). He argues that spin-1/2 particles (e.g., electrons) must be represented mathematically by what are known as complex spinors, and that the transformation properties of these spinors are not consistent with the introduction of nonstandard coordinates (corresponding to values of ε other than 1/2). Gunn and Vetharaniam (1995), however, present a derivation of the Dirac equation (the fundamental equation describing spin-1/2 particles) using coordinates that are consistent with arbitrary synchrony. They argue that Zangari mistakenly required a particular representation of space-time points as the only one consistent with the spinorial description of spin-1/2 particles.

The debate about conventionality of simultaneity seems far from settled, although some proponents on both sides of the argument might disagree with that statement. The reader wishing to pursue the matter further should consult the sources listed below as well as additional references cited in those sources.

Identity politics

The laden phrase "identity politics" has come to signify a wide range of political activity and theorizing founded in the shared experiences of injustice of members of certain social groups. Rather than organizing solely around ideology or party affiliation, identity politics typically concerns the liberation of a specific constituency marginalized within its larger context. Members of that constituency assert or reclaim ways of understanding their distinctiveness that challenge dominant oppressive characterizations, with the goal of greater self-determination.

1. History and Scope

The second half of the twentieth century saw the emergence of large-scale political movements -- second wave feminism, Black Civil Rights in the U.S., gay and lesbian liberation, and the American Indian movements, for example -- based in claims about the injustices done to particular social groups. These social movements are undergirded by and foster a philosophical body of literature that takes up questions about the nature, origin and futures of the identities being defended. Identity politics as a mode of organizing is intimately connected to the idea that some social groups are oppressed; that is, that one's identity as a woman or as a Native American, for example, makes one peculiarly vulnerable to cultural imperialism (including stereotyping, erasure, or appropriation of one's group identity), violence,

exploitation, marginalization, or powerlessness (Young 1990). Identity politics starts from analyses of oppression to recommend, variously, the reclaiming, redescription, or transformation of previously stigmatized accounts of group membership. Rather than accepting the negative scripts offered by a dominant culture about one's own inferiority, one transforms one's own sense of self and community, often through consciousness-raising. For example, in their germinal statement of Black feminist identity politics, the Combahee River Collective argued that "as children we realized that we were different from boys and that we were treated different -- for example, when we were told in the same breath to be quiet both for the sake of being 'ladylike' and to make us less objectionable in the eyes of white people. In the process of consciousness-raising, actually life-sharing, we began to recognize the commonality of our experiences and, from the sharing and growing consciousness, to build a politics that will change our lives and inevitably end our oppression" (Combahee River Collective 1982, 14-15).

The scope of political movements that may be described as identity politics is broad: the examples used in the philosophical literature are predominantly of struggles within Western capitalist democracies, but indigenous rights movements worldwide, nationalist projects, or demands for regional self-determination use similar arguments. Predictably, there is no straightforward criterion that makes a political struggle into an example of "identity politics;" rather, the term signifies a loose collection of political projects that each articulate a collective with a distinctively different social location that has hitherto been neglected, erased, or suppressed. It is beyond the scope of this essay to offer historical or sociological surveys of the many different social movements that might be described as identity politics, although some references to this literature are provided in the bibliography; instead the focus here is to provide an overview of the philosophical issues in the expansive literature in political theory.

The phrase "identity politics" is also something of a philosophical punching-bag for a variety of critics. Often challenges fail to make sufficiently clear their object of critique, using "identity politics" as a blanket description that invokes a range of tacit political failings (as discussed in Bickford 1997). From a contemporary perspective, some early identity claims by political activists certainly seem naive, totalizing, or unnuanced. However, the public rhetoric of identity politics both served useful and empowering purposes for some, and belied more subtle philosophical understandings of what political liberation requires. Since the twentieth century heyday of the well known political movements that made identity politics so visible, a vast academic literature has sprung up; although "identity politics" can draw on intellectual precursors from Mary Wollstonecraft to Frantz Fanon, writing that actually uses this specific phrase, with all its contemporary baggage, is limited almost exclusively to the last 15 years. Thus it was barely as intellectuals started to systematically outline and defend the philosophical underpinnings of identity politics that we simultaneously began to deconstruct them. At this historical juncture, then, asking whether one is for or against identity politics is to ask an impossible question. Wherever they line up in the debates, thinkers agree that the notion of *identity* has become indispensable to contemporary political discourse, at the same time as they concur that it has troubling implications for models of the self, political inclusiveness, and our possibilities for solidarity and resistance.

2. Philosophy and Identity

From this brief examination of how identity politics fits into the political landscape it is already clear that the use of the controversial term “identity” raises a host of philosophical questions. Logical uses aside, it is likely familiar to philosophers from the literature in metaphysics on personal identity -- one's sense of self and its persistence. Indeed, underlying many of the more overtly pragmatic debates about the merits of identity politics are philosophical questions about the nature of subjectivity and the self (Taylor 1989). Charles Taylor argues that the modern identity is characterized by an emphasis on its inner voice and capacity for *authenticity* -- that is, the ability to find a way of being that is somehow true to oneself (Taylor in Gutmann, ed. 1994). While doctrines of equality press the notion that each human being is capable of deploying his or her reason or moral sense to live an authentic live qua individual, the politics of difference has appropriated the language of authenticity to describe ways of living that are true to the identities of marginalized social groups. As Sonia Kruks puts it:

> What makes identity politics a significant departure from earlier, pre-identarian forms of the politics of recognition is its demand for recognition on the basis of the very grounds on which recognition has previously been denied: it is *qua* women, *qua* blacks, *qua* lesbians that groups demand recognition. The demand is not for inclusion within the fold of “universal humankind” on the basis of shared human attributes; nor is it for respect “in spite of” one's differences. Rather, what is demanded is respect for oneself *as* different (2001, 85).

For many proponents of identity politics this demand for authenticity includes appeals to a time before oppression, or a culture or way of life damaged by colonialism, imperialism, or even genocide. Thus for example Taiaiake Alfred, in his defense of a return to traditional indigenous values, argues that:

> Indigenous governance systems embody distinctive political values, radically different from those of the mainstream. Western notions of domination (human and natural) are noticeably absent; in their place we find harmony, autonomy, and respect. We have a responsibility to recover, understand, and preserve these values, not only because they represent a unique contribution to the history of ideas, but because renewal of respect for traditional values is the only lasting solution to the political, economic, and social problems that beset our people. (Alfred 1999, 5)

What is crucial about the “identity” of identity politics appears to be the experience of the subject, especially his or her experience of oppression and the possibility of a shared and more authentic alternative. Thus identity politics rests on unifying claims about the meaning of politically laden experiences to diverse individuals. Sometimes the meaning attributed to a particular experience will diverge from that of its subject: thus, for example, the woman who struggles desperately to be thin may think that she is simply trying to be a better person, rather than understanding her experience as part of the disciplining of female bodies in a patriarchal culture. Making sense of such disjunctions relies on notions such as false consciousness -- the systematic mystification of the experience of the oppressed by the perspective of the dominant. Thus despite its conflicts with Marxism and other radical political models, identity politics shares with them the anti-liberal view that individuals' perceptions of their own interests may be systematically distorted by ideology and must be somehow freed of their misperceptions by group-

based transformation.

Concern about this aspect of identity politics has crystallized around the transparency of experience to the oppressed, and the univocality of its interpretation. Experience is never, critics argue, epistemically available with a singular meaning (Scott 1992); rather it requires a theoretical framework -- implicit or explicit -- to give it sense. Moreover, if experience is the origin of politics, then some critics worry that what Kruks (2001) calls "an epistemology of provenance" will become the norm: on this view, political perspectives gain legitimacy by virtue of their articulation by subjects of particular experiences. This closes off the possibility of critique of these perspectives by those who don't share the experience, which in turn inhibits political dialogue and coalition-building.

From these understandings of subjectivity, it is easy to see how critics of identity politics, and even some cautious supporters, have feared that it is prone to *essentialism*. This term is another philosophical term of abuse, intended to capture a multitude of sins. In its original contexts in metaphysics, the term implies the belief that an object has a certain quality by virtue of which it is what it is; for Locke, famously, the essence of a triangle is that it is a three-sided shape. In the contemporary humanities the term is used more loosely to imply, most commonly, an illegitimate generalization about identity (Heyes 2000). In the case of identity politics, two claims stand out as plausibly "essentialist:" the first is the understanding of the subject that makes a single axis of identity stand in for the whole, as if being Asian-American, for example, were entirely separable from being a woman. To the extent that identity politics urges mobilization around a single axis, it will put pressure on participants to identify that axis as their defining feature, when in fact they may well understand themselves as heterogeneous selves with multiple identities and political goals (Spelman 1988). The second form of essentialism is closely related to the first: generalizations made about particular social groups in the context of identity politics may come to have a disciplinary function within the group, not just describing but also dictating the self-understanding that its members should have. Thus, the supposedly liberatory new identity may inhibit autonomy, as Anthony Appiah puts it, replacing "one kind of tyranny with another" (Appiah in Gutmann ed. 1994, 163). Just as dominant groups in the culture at large insisted that the marginalized integrate by assimilating to dominant norms, so within some practices of identity politics dominant sub-groups may, in theory and practice, impose their vision of the group's identity onto all its members. For example, in his films *Black Is, Black Ain't* and *Tongues Untied* Marlon Riggs eloquently portrays the exclusion of Black women and gay Black men from heterosexist and masculinist understandings of African-American identity politics.

Philosophical discussion around the identities identity politics defends has thus centered on a familiar metaphysical tension between identity and difference, and the possibilities for solidarity when these opposites are transposed to political contexts. Postmodern critics have suggested that alterity from dominant norms and within and between marginalized group members is a better descriptive and normative social ontology. How can a politics of difference mediate a conventional liberal individualism and more traditional identity politics? This question reflects the tremendous ambivalence with which all interlocutors approach identity politics. Many commentators describe and theorize the experience of hybridity for those whose identities are especially far from norms of univocality: Gloria Anzaldúa, for example, famously writes of her *mestiza* identity as a Chicana, American, raised poor, a lesbian and a

feminist, living in the metaphoric and literal Borderlands of the American Southwest (Anzaldúa 1999 [1987]). Some suggest the deployment of "strategic essentialism:" we should act *as if* an identity were uniform only to achieve interim political goals, without implying any deeper authenticity (Spivak 1990, 1-16). Others argue that a relational social ontology, which makes clear the fluidity and interdependence of social groups, should be developed as an alternative to the reification of other approaches to identity politics (Young 2000; Nelson 2001). These new accounts of subjectivity, new ontologies, and new ways of understanding solidarity and relationships are perhaps the most interesting and important face of contemporary scholarship in identity politics.

3. Liberalism and Identity Politics

A key condition of possibility for contemporary identity politics was institutionalized liberal democracy (Brown 1995). The perceived paucity of rewards offered by liberal capitalism after the extension of formal rights to most adult citizens spurred forms of radical critique that sought to explain the persistence of oppression. At the most basic philosophical level, critics of liberalism suggested that liberal social ontology -- the model of the nature of and relationship between subjects and collectives -- was misguided. The social ontology of most liberal political theories consists of citizens conceptualized as essentially similar individuals, as for example in John Rawls' famous thought experiment using the "original position," in which representatives of the citizenry are conceptually divested of all specific identities or affiliations in order to make rational decisions about social welfare (Rawls 1970). To the extent that group interests are represented in liberal polities, they tend to be understood as associational, forms of interest group pluralism whereby those sharing particular interests voluntarily join together to create a political lobby. Citizens are free to register their individual preferences (through voting, for example), or to aggregate themselves for the opportunity to lobby more systematically (e.g. by forming an association such as a neighborhood community league). These lobbies, however, are not defined by the identity of their members so much as by specific shared interests and goals, and their members are not taken to be peculiarly disadvantaged in pressing their case. Indeed, interest groups continue to include very powerful associations such as the National Rifle Association in the U.S., or tobacco company lobbies. Finally, political parties, the other primary organs of liberal democratic government, critics suggest, have few moments of inclusivity, being organized around party discipline, responsiveness to lobby groups, and broad-based electoral popularity. Ultimately conventional liberalism, diverse radical critics claim, cannot effectively address the ongoing structural marginalization that persists in late capitalist liberal states, and may even be complicit with it (Young 1990; P. Williams 1991; Brown 1995; M. Williams 1998).

On a philosophical level, these understandings of the political subject and its relationship to collectivity came to seem inadequate to ensuring representation for women, gays and lesbians, or racial-ethnic groups (M. Williams 1998). Critics charged that the neutral citizen of liberal theory was in fact the bearer of an identity coded white, male, bourgeois, able-bodied, and heterosexual (Young 1990). This implicit ontology in part explained the persistent historical failure of liberal democracies to achieve anything more than token inclusion in power structures for members of marginalized groups. A richer understanding of political subjects as deeply shaped by their social location was required. In particular, the history and experience of oppression brought with it certain perspectives and needs that could not be assimilated

through existing liberal structures. Individuals are oppressed by virtue of their membership in a particular *social group* -- that is, a collective whose members have relatively little mobility into or out of the collective, who usually experience their membership as involuntary, who are generally identified as members by others, and whose opportunities are deeply shaped by the relation of their group to corollary groups through privilege and oppression. Oppression, then, is the systematic limiting of opportunity or constraints on self-determination because of such membership: for example, Frantz Fanon eloquently describes the experience of being always constrained by the white gaze as a Black man: “I already knew that there were legends, stories, history, and above all *historicity*… I was responsible at the same time for my body, my race, for my ancestors” (Fanon 1968, 112). Conversely, members of dominant groups are *privileged* -- systematically advantaged by the deprivations imposed on the oppressed. For example, in a widely cited article Peggy McIntosh identifies whiteness as a dominant identity, and lists 47 ways in which she is advantaged by being white compared with her colleagues of color. These range from being able to buy “flesh-colored” Band-Aids that will match her skin tone, to knowing that she can be rude without provoking negative judgments of her racial group, to being able to buy a house in a middle-class community without risking neighbors' disapproval (1993).

Critics have also charged that *assimilation* (or, less provocatively, integration) is a guiding principle of liberalism. If the liberal subject is coded in the way Young (1990) suggests, then attempts to apply liberal norms of equality will risk demanding that the marginalized conform to the identities of their oppressors. For example, many gays and lesbians have objected to campaigns to institute “gay marriage” on the grounds that these legal developments assimilate same-sex relationships to a heterosexual model, rather than challenging its terms. If this is *equality*, they claim, then it looks suspiciously like the erasure of socially subordinate identities rather than their genuine incorporation into the polity. This suspicion helps to explain the affiliation of identity politics with *separatism*. This latter is a set of positions that share the view that attempts at integration of dominant and marginalized groups so consistently compromise the identity or potential of the less powerful that a distinct social and political space is the only structure that will adequately protect them. In Canada, for example, Québec separatists claim that the French language and francophone culture are persistently erased within an overwhelmingly dominant Anglo-American continent, despite the efforts of the Canadian state to maintain its official bilingualism and to integrate Québec into the nation. Given their long history of conflict and marginalization, a separate and sovereign Québec, they argue, is the only plausible solution (e.g. Laforest in Beiner and Norman 2001). Analogous arguments have been made on behalf of Native American and other indigenous peoples and African Americans (e.g. Alfred 1999, Asante 2000). Lesbian feminist separatists have claimed that the central mechanism for the oppression of women under patriarchy is heterosexuality. Understanding heterosexuality as a forced contract or compulsory institution, they argue that women's relationships with men are persistently characterized by domination and subordination. Only divorce (literal and figurative) and the creation of new geographic and political communities of woman-identified women will end patriarchal exploitation, and forge a liberatory female identity (Rich 1980; Frye 1983; Radicalesbians 1988; Wittig 1992).

One of the central charges against identity politics by liberals, among others, has been its alleged reliance on notions of sameness to justify political mobilization. Looking for people who are *like* you rather than who share your political values as allies runs the risk of sidelining critical political analysis of complex

social locations and ghettoizing members of social groups as the only persons capable of making or understanding claims to justice. After an initial wave of relatively uncompromising identity politics, proponents have taken these criticisms to heart and moved to more philosophically nuanced accounts that appeal to *coalitions* as better organizing structures. On this view, separatism around a single identity formation must be muted by recognition of the internally heterogeneous and overlapping nature of social group memberships. The idea of a dominant identity from which the oppressed may need to disassociate themselves remains, but the alternative becomes a more fluid and diverse grouping, less intent on guarantees of internal homogeneity and more concerned with identifying "family resemblances" than literal identity (Heyes 2000).

This trajectory -- from formal inclusion in liberal polities, to assertions of difference and new demands under the rubric of identity politics, to internal and external critique of identity political movements -- has taken different forms in relation to different identities. Increasingly it is difficult to see what divides contemporary positions, and some commentators have suggested possible *rapprochements* between liberalism and identity politics (e.g. Laden 2001). A problem in sorting through such claims is the vagueness of philosophical discussions of identity politics, which are often content to list their rubric under the mantra of "gender, race, class, etc." although these three are not obviously analogous, nor is it clear which identities are gestured toward by the predictable "etc." (or why they do not merit naming). Class in particular has a distinctively different political history, and contemporary critics of identity politics, as I'll discuss below, often take themselves to be defending class analysis against identity politics' depoliticizing effects. Of those many forms of identity politics to which large academic literatures attach, however, I'll briefly highlight key issues concerning gender, sexuality, disability, and a complex cluster of race, ethnicity and multiculturalism.

4. Gender and Feminism

Twentieth century feminism has consistently opposed biological determinism: the view that shared biological features among a certain group lead inevitably to certain social roles or functions. For example, one early opponent of women's suffrage suggested that women and men had different metabolic systems -- katabolic (or "energy-expending") in men, and anabolic (or "energy-conserving") in women -- that precluded women's effective or informed participation in politics (see Moi 2000, 3-21 for discussion). Feminist identity politics, then, takes up the task of articulating women's understandings of themselves (and of men) without reducing femininity (or masculine dominance) to biology, and instead situating women as oppressed under patriarchy. Two philosophical questions dog this endeavor: first, what to make of biological difference? In their eagerness to present gender as socially constructed and entirely separable from sex, feminists sidelined women's experiences of childbirth, menopause, or embodiment generally as "essentialist" and irrelevant to feminist politics. This gap is now being filled by so-called "sexual difference" feminism, but the legacy of social constructionism that reads gender identity only as a set of ideas rather than also embodied experiences has proved hard to shake. Second, the very idea of reclaiming women's identities from patriarchy has been criticized as merely an affirmation of a slave morality -- a Nietzschean term describing the *ressentiment* of the oppressed as they rationalize and prescribe their condition. Attempts from various quarters to capture and revalue the distinctively feminine

(by theorizing, for example, “maternal thinking,” [Ruddick 1989], or *écriture féminine* [Irigaray 1985]) risk endorsing existing power relations. Thus the heated debates surrounding the “ethic of care” in moral psychology, for example, line up around two constellations of positions: on the one hand, advocates of the ethic of care as a distinctively feminine contribution to moral reasoning point to its benefits for negotiating a social world characterized by webs of relationship, and to the pathologies of masculine disassociation. Carol Gilligan is the best known proponent of this position (although the details of her complex paradigm are often glossed or misrepresented) (Gilligan 1993 [1982]). Her critics charge that she reifies femininity -- were women not oppressed, they would not speak in the voice of care, thus casting doubt on its usefulness as a liberatory strategy. The current construction of femininity is so deeply imbricated with the oppression of women that such attempts will always end up reinforcing the very discourse they seek to undermine (Butler 1999 [1990]); this critique has strong affiliations with poststructuralism (which are discussed below).

The narrative of feminist interpretation of gender relations most commonly offered points to universalizing claims made on behalf of women during the so-called “second wave” of the feminist movement in the late 1960's and 1970's in Western countries. The most often discussed (and criticized) second wave feminist icons -- women such as Betty Friedan or Gloria Steinem -- are white, middle-class, and heterosexual, although this historical picture too often neglects the contributions of lesbian feminists, feminists of color, and working-class feminists, which were less visible in popular culture, perhaps, but arguably equally influential in the lives of women. For some early radical feminists, women's oppression *as women* was the core of identity politics, and should not be diluted with other identity issues. For example, Shulamith Firestone, in her classic book *The Dialectic of Sex*, argued that “*racism is sexism extended*,” and that the Black Power movement represented only sexist cooptation of Black women into a new kind of subservience to Black men. Thus for Black women to fight racism (especially among white women) was to divide the feminist movement, which properly focused on challenging patriarchy, understood as struggle between men and women, the foundational dynamic of all oppressions (Firestone 1970, esp. 103-120).

Claims about the universality of gender made during the second wave have been extensively criticized in feminist theory for failing to recognize the specificity of their own constituencies. For example, Friedan's famous proposition that women needed to get out of the household and into the professional workplace was, bell hooks pointed out, predicated on the experience of a post-war generation of white, middle-class married women confined to housekeeping and child-rearing by their professional husbands (Friedan 1963; hooks 1981). Many women of color and working-class women had worked outside their homes (sometimes in *other* women's homes) for decades; some lesbians had a history of working in traditionally male occupations or living alternative domestic lives without a man's “family wage.” Similarly, some women from the Southern hemisphere have been critical of Northern feminist theory for globalizing its claims. Such moves construct Southern women, they argue, as less developed or enlightened versions of their Northern counterparts, rather than understanding their distinctively different situation (Mohanty 1988); or, they characterize liberation for Northern women in ways that exacerbate the exploitation of the South: by supporting economic conditions in which increasing numbers of western women can abuse immigrant domestic workers, for example (Anderson 2000).

Thus feminist claims made about the oppression of women founded in a notion of shared experience and identity are now invariably greeted with philosophical suspicion. Some critics have charged that this suspicion itself has become excessive, undercutting the very possibility of generalizations about women that gives feminist theory its force (Martin 1994), or that it marks the distancing of feminist philosophy from its roots in political organizing. Others suggest alternative methods for feminist theory that will minimize the emphasis on shared criteria of membership in a social group and stress instead the possibilities for alliances founded on non-identical connections (Young 1997; Heyes 2000; Cornell 2000). It is commonplace to hear that "identity" is a term in serious crisis in feminist thought, and that feminist praxis must move beyond identity politics (Dean 1996). Nonetheless, sex-gender as a set of analytical categories continues to guide feminist thought, albeit in troubled and troubling ways.

5. From Gay and Lesbian to Queer

Nowhere have conceptual struggles over identity been more pronounced than in the lesbian and gay liberation movement. The notion that sexuality provides a stable and authentic core identity has itself been profoundly challenged by the advent of queer politics. Most early lesbian and gay activists emphasized the authenticity of their identities; they were a distinctively different natural kind of person, with the same rights as heterosexuals (another natural kind) to find fulfillment in marriage, child-rearing, property ownership, and so on. This conformist strand of gay organizing (perhaps associated more closely with white, middle-class gay men, at least until the radicalizing effects of the AIDS pandemic) has a genealogy going back to pre-Stonewall homophilic activism. While early lesbian feminists had a very different politics, oriented around liberation from patriarchy and the creation of separate spaces for woman-identified women, many still appealed to a more authentic, distinctively feminist self. Heterosexual feminine identities were products of oppression, yet the literature imagines a utopian alternative where woman-identification will liberate the lesbian within every woman.

The paradigm shift that the term "queer" signals, then, is a shift to a model in which identities are more self-consciously historicized, seen as contingent products of particular genealogies rather than enduring or essential natural kinds (Phelan 1989 and 1994; Blasius 2001). Michel Foucault's work, especially his *History of Sexuality*, is the most widely cited progenitor of this view: Foucault famously argues that "homosexuality appeared as one of the forms of sexuality when it was transposed from the practice of sodomy onto a kind of interior androgyny, a hermaphrodism of the soul. The sodomite had been a temporary aberration; the homosexual was now a species" (Foucault 1980, 43). Although Foucault is the most often cited as the originator of social constructionist arguments about sexuality, other often neglected writers contributed to the emergence of this new paradigm (e.g. M. McIntosh 1968). In western popular culture such theories co-exist uneasily with biologically essentialist accounts of sexual identity, which look for a particular gene, brain structure, or other biological feature that will explain same-sex sexual desire. At stake are not only epistemic questions about the correct explanation for certain human behaviors, but also a host of moral and political questions. If sexual identity is biological, then no individual is morally responsible for it, any more than it makes sense to say that an individual is responsible for his or her race. Some gay activists thus see biological explanations of sexuality as offering a defense against homophobic commentators who believe that gays can voluntarily change their

“immoral” behaviors. Indeed, much of the intuitive hostility to social constructionist accounts of sexuality within gay and lesbian communities seems to come from the dual sense of many individuals that they could not have been other than gay, and that anything less than a radically essentialist view of sexuality will open the door to further attempts to “cure” them of their homosexuality (through “ex-gay ministries,” for example).

Whatever the truth of these fears, Eve Sedgwick is right to say that no specific form of explanation for the origins of sexual preference will be proof against the infinitely varied strategies of homophobia (Sedgwick 1990, esp. 22-63). Queer politics, then, both stresses the usefulness of social constructionism while eschewing a genetic quest for the origins of homosexuality as always a presentist history. In addition to historicizing and contextualizing sexuality, including the very idea of sexual identity, the shift to queer is also characterized by deconstructive methods. Rather than understanding sexual identities as a set of discrete and independent social types, queer theorists emphasize their mutual implication: for example, the word “homosexuality” first appears in English in 1897, but the term “heterosexuality” is back-formed, first used some years later (Garber 1995, 39-42). Heterosexuality comes into existence as a way of understanding the nature of individuals *after* the homosexual has been diagnosed; homosexuality *requires* heterosexuality as its opposite, despite its self-professed essentialism. Queer theorists point out that the homo/hetero dichotomy, like many others in western intellectual history that it arguably draws on and reinforces, is not only mutually implicated, but also hierarchical (heterosexuality is superior, normal, and inevitable) and masquerades as natural or descriptive. The task of a more radical “identity politics,” on this vision, is to constantly denaturalize and deconstruct the identities in question, with a political goal of their subversion rather than their accommodation.

An exemplary conflict within the identity politics of sexuality focuses on the expansion of gay and lesbian organizing to those with other queer affiliations, especially bisexual and transgendered activists. Skepticism about inclusion of these groups in organizational mandates, community centers, parades, and festivals has origins in more traditional understandings of identity politics that see reclaiming lesbian and/or gay identity from its corruption in a homophobic society as a task compromised by those whose identities are read as diluted, treacherous, ambiguous, or peripheral. Lesbian feminist critiques of transgender, for example, see male-to-female transsexuals in particular as male infiltrators of women's space, individuals so intent on denying their male privilege that they will modify their bodies and attempt to pass as women to do it; bisexual women dabble in lesbian life, but flee to straight privilege when occasion demands (see Heyes 2003 for references and discussion). These arguments have been challenged in turn by writers who see them as attempts to justify purity of identity that merely replace the old exclusions with new dictatorships (Stone 1991, Lugones 1994) and inhibit coalitional organizing against conservative foes.

6. Disability

The trope of social constructionism reappears in disability studies as the argument that disability is not a natural or objective flaw of certain individuals, but rather a set of challenges faced by those whose needs the dominant culture fails to accommodate (Wendell 1996; Davis 1997). In a society in which buildings

or communications systems, for example, were differently designed, many of the struggles of people currently labeled "disabled" would no longer be disadvantaged. This has been the basis for legislation (such as the 1990 Americans with Disabilities Act), which requires of employers that they make reasonable accommodation for disabled employees, to minimize the disadvantages they face. Disability rights language here draws on feminist discourse: if employers are obliged to accommodate childbirth and parental leave (when once they would have fired or not hired women who had or were thought likely to have children), then other embodied differences merit the same treatment in order that employees can perform to their full potential. Thus disability rights advocates use the familiar strategy of shifting moral responsibility for an identity away from those who involuntarily share it, towards those whose actions have made it oppressive.

That disability should be involuntary rather than chosen has become an important issue here (in some ways paralleling debates in sexuality studies). It is a trope of liberal discourse that one should not be held morally responsible for traits (or their consequences) that one cannot control; thus arguments from accommodation have come to depend on disability being understood as analogous to sex or race in its immutability. Yet life-long smokers with chronic lung disease, or the very obese (to take a particularly tricky example), also require changes to work schedules or physical environments to participate in public life. If choosing to act differently *could* ameliorate or dispel the disability in question, why should others accommodate it?

Many philosophers of disability suggest that these questions conceal a deeper issue: like many objectors to identity politics, those skeptical of accommodating the disabled are liable to assume a charity model. The disabled, they suggest, are simply a burden on the larger society, and their demands constitute special pleading. Yet like many marginalized groups, disabled rights advocates point out that experiences of disability are far from entirely negative, and in fact have value as source of knowledge or a standpoint unavailable to others (Wendell 1996). This argument has taken a particularly forceful turn within Deaf studies, where scholars have argued that the Deaf constitute a separate culture and linguistic minority (as users of sign languages) that should be preserved and fostered. New technologies (such as cochlear implants) promise to reduce the numbers of deaf people, and increase the proportion of the deaf and hard-of-hearing who can use spoken language to communicate with hearing culture. For some Deaf activists, this move is less the lifting of an unfortunate affliction than the genocide of an under-valued and stigmatized culture. Again, the identity of being Deaf is affirmed contra attempts to assimilate it to the terms of the hearing.

7. Race, Ethnicity, and Multiculturalism

Similar debates in philosophy of race highlight the socially constructed and historical nature of "race" as a category of identity. Despite a complex history of biological essentialism in the presentation of racial typologies, the notion of a genetic basis to racial difference has been discredited; the criteria different societies (at different times) use to organize and hierarchize "racial formations" are political and contingent (Omi and Winant 1986). While skin color, appearance of facial features, or hair type are in some trivial sense genetically determined, the grouping of different persons into *races* does not pick out

any patterned biological difference. What it does pick out is a set of social meanings (Alcoff 1997). The most notorious example of an attempt to rationalize racial difference as biological is the U.S. "one-drop rule," under which an individual was characterized as Black if they had "one drop" or more of "Black blood." Adrian Piper points out that not only does this belief persist into contemporary readings of racial identity, it also implies that given the prolonged history of racial mixing in the US -- both coerced and voluntary -- very significant numbers of nominally "white" people in the U.S. today should be re-classified as "Black" (Piper 1996). In those countries that have had official racial classifications, individuals' struggles to be re-classified almost always as a member of a more privileged racial group are often invoked to highlight the contingency of race, especially at the borders of its categories. And a number of histories of racial groups that have apparently changed their racial identification -- Jews, Italians, or the Irish, for example -- also illustrate social constructionist theses (Ignatiev 1995).

The claim that race is socially constructed does not in itself mark out a specific identity politics. Indeed, the very contingency of race and its lack of correlation with ethnicity or culture circumscribes its political usefulness: just as feminists have found the limits of appeals to "women's identity," so Asian-Americans may find with ethnicities and cultures as diverse as Chinese, Indian, or Vietnamese that their racial designation itself provides little common ground. That a US citizen of both Norwegian and Ashkenazi Jewish heritage will check that they are "white" on a census form says relatively little (although nonetheless something) about their experience of their identity, or indeed of their very different relationship to anti-Semitism. Tropes of separatism and the search for forms of authentic self-expression are related to race via ethno-cultural understandings of identity: for example, the U.S. Afro-centric movement appeals to the cultural significance of African heritage for Black Americans (Asante 2000).

Where perhaps racial categories are most politically significant is in their contested relation to racism. Racism attempts to reduce members of social groups to their racial features, drawing on a complex history of racial stereotypes to do so. Racism is arguably analogous to other forms of oppression in being both overt and institutionalized, manifested both as deliberate acts by individuals and as unplanned systemic outcomes. The specific direction of US discussion of the categories of race has been around color-blind versus color-conscious public policy (Appiah and Gutmann 1996). Color-blindness -- that is, the view that race *should* be ignored in public policy and everyday exchange -- has hegemony in popular discourse. Drawing attention to race -- whether in a personal description or in university admissions procedures -- is unfair and racist. Advocates of color-consciousness argue that racism will not disappear without proactive efforts, which require the invocation of race. Thus affirmative action, for example, requires statistics about the numbers of members of oppressed racial groups employed in certain contexts, which in turn requires racial identification and categorization. Thus those working against racism face a paradox familiar in identity politics: the very identity they aim to dispel must be invoked to make their case.

The literature on multiculturalism takes up questions of race, ethnicity, and cultural diversity in relation to the liberal state. Some multicultural states -- notably Canada -- allegedly aim to permit the various cultural identities of their residents to be preserved rather than assimilated, despite the concern that the over-arching liberal aims of such states may be at odds with the values of those they claim to protect. For example, Susan Moller Okin argues that multiculturalism is sometimes bad for women, especially when it

works to preserve patriarchal values in minority cultures. If multiculturalism implies a form of cultural relativism that prevents judgment of or interference with the “private” practices of minorities, female genital mutilation, forced marriage, compulsory veiling, or being deprived of education may be the consequence. Okin's critics counter that she falsely portrays culture as static, internally homogeneous, and defined by men's values, allowing liberalism to represent a culturally unmarked medium for the defense of individual rights (Okin et al 1999). For many commentators on multiculturalism this is the nub of the issue: is there an inconsistency between defending the rights of minority cultures, while prohibiting those (allegedly) cultural practices that the state judges illiberal? Can liberalism sustain the cultural and value-neutrality that some commentators still ascribe to it, or to what extent should it embrace its own cultural specificity (Taylor, Habermas in Gutmann, ed. 1994; Lawrence and Herzog, eds. 1994; Kymlicka, ed. 1995)? Defenders of the right to cultural expression of minorities in multicultural states thus practice forms of identity politics that are both made possible by liberalism and sometimes in tension with it.

8. Other Challenges to Identity Politics

Since its 1970s vogue, identity politics as a mode of organizing and set of political philosophical positions has undergone numerous attacks by those motivated to point to its flaws, whether by its pragmatic exclusions or more programmatically as liberals, Marxists, or poststructuralists. For many leftist commentators, identity politics is something of a *bête noire*, representing the capitulation to cultural criticism in place of analysis of the material roots of oppression. Marxists, both orthodox and revisionist, and socialists -- especially those who came of age during the rise of the New Left in western countries -- have often interpreted the perceived ascendancy of identity politics as representing the end of radical materialist critique (see discussion in Farred 2000). Identity politics, for these critics, is both factionalizing and depoliticizing, drawing attention away from the ravages of late capitalism toward superstructural cultural accommodations that leave economic structures unchanged. For example, while allowing that both recognition and redistribution have a place in contemporary politics, Nancy Fraser laments the supremacy of perspectives that take injustice to inhere in “cultural” constructions of identity that the people to whom they are attributed want to reject. Such recognition models, she argues, require remedies that “valorize the group's ‘groupness’ by recognizing its specificity,” thus reifying identities that themselves are products of oppressive structures. By contrast, injustices of distribution require redistributive remedies that aim “to put the group out of business as a group” (Fraser 1997, 19).

The reasons given for this alleged turn away from economic oppression to themes of culture, language, and identity in contemporary politics differ. First, the institutionalization of North American radicalism in the middle-class bastion of academia creates incentives for intellectuals to minimize the political importance of their own class privilege, and focus instead on other identities (in turn divorced from their economic inflections). Second, Wendy Brown suggests that capitalist suffering has been displaced onto other identities, interpreted through the lens of class aspiration (Brown 1995, 59-60). Third, the turn away from economic analysis may be less dramatic than some critics believe: recent activism against global capitalism indicates a resurgence in economic critique that is now arguably more fully imbricated with identity politics (Lott 2000). Finally, the rise of diverse “postmodern” paradigms offers sophisticated theoretical alternatives to Marxism for those on the left.

Poststructuralist challenges to identity politics are perhaps the most philosophically developed and profound. Poststructuralists charge that identity politics rests on a mistaken view of the subject that assumes a *metaphysics of substance* -- that is, that a cohesive, self-identical subject can be identified and reclaimed from oppression (Butler 1999). This subject has certain core essential attributes that define her or his identity, over which are imposed forms of socialization that cause her or him to internalize other nonessential attributes. This position, they suggest, misrepresents both the psychology of identity and its political significance. The alternative view offered by poststructuralists is that the subject is itself always already a product of discourse, that possibilities for subjecthood are set out in advance of any possible expression by an individual. Some critics are uncomfortable with the limitations on agency this seems to assume, but advocates argue that changing discourse itself is a better possible goal than reclaiming authentic identities; individual choices have a role to play in this project.

Also key to poststructuralist positions is the mutually sustaining opposition of identity and difference:

> An identity is established in relation to a series of differences that have become socially recognized. These differences are essential to its being. If they did not coexist as differences, it would not exist in its distinctness and solidity. Entrenched in this indispensable relation is a second set of tendencies, themselves in need of exploration, to conceal established identities into fixed forms, thought and lived as if their structure expressed the true order of things. When these pressures prevail, the maintenance of one identity (or field of identities) involves the conversion of some differences into otherness, into evil, or one of its numerous surrogates. Identity requires differences in order to be, and it converts difference into otherness in order to secure its own self-certainty. (Connolly 2002, 64)

The dangers of identity politics, then, are that it casts as authentic to the self or group an identity that in fact is defined by its opposition to an Other. Reclaiming such an identity as one's own merely reinforces its dependence on this dominant Other, and further internalizes and reinforces an oppressive discourse. These moves cultivate *ressentiment* (the moralizing revenge of the powerless): while the charge that identity politics promotes a victim mentality is often facile, Brown makes a sophisticated version of the critique. She argues that identity politics has its own genealogy in liberal capitalism that relentlessly reinforces the “wounded attachments” it claims to sever: “Politicized identity thus enunciates itself, makes claims for itself, only by entrenching, restating, dramatizing, and inscribing its pain in politics; it can hold out no future -- for itself or others -- that triumphs over this pain” (Brown 1995, 74).

What political alternatives does this model imply? Proponents of identity politics have suggested that poststructuralism is politically impotent, capable only of deconstruction and never of action (Hartsock 1998, 205-226). Yet there are political projects motivated by poststructuralist theses. For example, Judith Butler's famous articulation of *performativity* as a way of understanding subject-development suggests to her and others the possibility of disarticulating seamless performances to subvert the meanings with which they are invested (Butler 1999). Drag can constitute such a disarticulation, although other critics have suggested other examples; Adrian Piper's conceptual art seeks to disrupt the presumed self-identity

of race by showing how it is actively interpreted and reconstituted, never determinate and self-evident.

9. Identity Politics in the 21st Century

The continuing intellectual crisis surrounding identity politics paradoxically marks its importance to contemporary political philosophy and practice. Both flexible and extensible, identity political tropes continue to influence new political claims: can identity politics be extended to children, for example, as the emergent children's rights movement implies? Identity politics has limits, too: is it too person-centered? How can identity politics also be an environmental politics (Sandilands 2000)? Perhaps most important for philosophers, the idea of identity itself appears to be in a period of rapid evolution. Changing technologies are having a profound impact on our philosophical understandings of who we are. Attempts to decode human genetics and possibly shape the genetic make-up of future persons (Wald 2000), to clone human beings, or to xeno-transplant animal organs, and so on, all raise deep philosophical questions about the kind of thing a person is. We are capable of changing our bodies in ways that dramatically change our identities, including through sex change or cosmetic surgeries, with immediate consequences for the kinds of identities I have been discussing in this essay. As more and more people form political alliances using disembodied communications technologies, the kinds of identities that matter seem also to shift (Turkle 1995). Our identities are increasingly pathologized as syndromes and disorders and treated by psychiatrists, and political thinkers should continue to criticize and resist the tendency to dehistoricize and naturalize them (Elliott 2003). At the same time, familiar mechanisms of oppression are further entrenching the very identities that in some western, wealthy contexts look set to fragment. Global capitalism appears to be widening the gap between the North and South, and working to further marginalize women, ethnic or indigenous minorities, and the disabled in the so-called Third and Fourth Worlds.[1] This mass of shifts and contradictions helps explain one move that almost all intellectuals agree on: identity politics must adopt a local focus. Structures of oppression may operate at macro-levels, but their consequences for the lived experience of those whose self-determination they undermine are myriad.

Notes to Identity Politics

Notes

1. The term "Third World" is clearly problematic in that it indicates a part of the world that has fallen behind, or lost the race to development altogether, rather than highlighting the exploitation and over-development of the “First World.” The term “Fourth World” is used to describe the increasing numbers of very poor who live in the world's wealthy countries.

Feminist Perspectives on the Self

The topic of the self has long been salient in feminist philosophy, for it is pivotal to questions about personhood, identity, the body, and agency that feminism must address. In some respects, Simone de Beauvoir's trenchant observation, "He is the Subject, he is the Absolute -- she is the Other," sums up why the self is such an important issue for feminism. To be the Other is to be the non-subject, the non-person, the non-agent -- in short, the mere body. In law, in customary practice, and in cultural stereotypes, women's selfhood has been systematically subordinated, diminished, and belittled, when it has not been outright denied. Since women have been cast as lesser forms of the masculine individual, the paradigm of the self that has gained ascendancy in U.S. popular culture and in Western philosophy is derived from the experience of the predominantly white and heterosexual, mostly economically advantaged men who have wielded social, economic, and political power and who have dominated the arts, literature, the media, and scholarship. Responding to this state of affairs, feminist philosophical work on the self has taken three main tacks: (1) critique of established views of the self, (2) reclamation of women's selfhood, and (3) reconceptualization of the self to incorporate women's experience. This entry will survey feminist perspectives on the self from all three of these angles.

---

1. Critique

Two views of the self have been prominent in contemporary Anglo-American moral and political

philosophy -- a Kantian ethical subject and homo economicus. Both of these conceptions see the individual as a free and rational chooser and actor -- an autonomous agent. Nevertheless, they differ in their emphasis. The Kantian ethical subject uses reason to transcend cultural norms and to discover absolute moral truth, whereas homo economicus uses reason to rank desires in a coherent order and to figure out how to maximize desire satisfaction. Whether the self is identified with pure abstract reason or with the instrumental rationality of the marketplace, though, these conceptions of the self isolate the individual from personal relationships and larger social forces. For the Kantian ethical subject, emotional bonds and social conventions imperil objectivity and undermine commitment to duty. For homo economicus, it makes no difference what social forces shape one's desires provided they do not result from coercion or fraud, and one's ties to other people are to be factored into one's calculations and planning along with the rest of one's desires. Some feminist philosophers modify and defend these conceptions of the self. But their decontextualized individualism and their privileging of reason over other capacities trouble many feminist philosophers.

Twentieth century philosophy's regnant conceptions of the self minimize the personal and moral import of unchosen circumstances and interpersonal relationships. They eclipse family, friendship, passionate love, and community, and they downplay the difficulty of resolving conflicts that arise between these commitments and personal values and aspirations. Since dependency is dismissed as a defective form of selfhood, caregiving responsibilities vanish along with children, the disabled, and the frail elderly. Prevailing conceptions of the self ignore the multiple, sometimes fractious sources of social identity constituted by one's gender, sexual orientation, race, class, age, ethnicity, and so forth. Structural domination and subordination do not penetrate the "inner citadel" of selfhood. Likewise, these conceptions deny the complexity of the intrapsychic world of unconscious fantasies, fears, and desires, and they overlook the ways in which such materials intrude upon conscious life. The homogenized -- you might say sterilized -- rational subject is not prey to ambivalence, anxiety, obsession, prejudice, hatred, or violence. A disembodied mind, the body is peripheral -- a source of desires for homo economicus to weigh and a distracting temptation for the Kantian ethical subject. Age, looks, sexuality, and physical competencies are extraneous to the self. As valuable as the capacities for rational analysis and free choice undoubtedly are, it is hard to believe that there is nothing more to the self.

Feminist philosophers have charged that these views are, at best, incomplete and, at worst, fundamentally misleading. Many feminist critiques take the question of who provides the paradigm for these conceptions as their point of departure. Who models this free, rational self? Although represented as genderless, sexless, raceless, ageless, and classless, feminists argue that the Kantian ethical subject and homo economicus mask a white, healthy, youthfully middle-aged, middleclass, heterosexual MAN. He is pictured in two principle roles -- as an impartial judge or legislator reflecting on principles and deliberating about policies and as a self-interested bargainer and contractor wheeling and dealing in the marketplace. It is no accident that politics and commerce are both domains from which women have historically been excluded. It is no accident either that the philosophers who originated these views of the self typically endorsed this exclusion. Deeming women emotional and unprincipled, these thinkers advocated confining women to the domestic sphere where their vices could be neutralized, even transformed into virtues, in the role of submissive wife and nurturant mother.

Feminist critics point out, furthermore, that this misogynist heritage cannot be remedied simply by condemning these traditional constraints and advocating equal rights for women, for these conceptions of the self are themselves gendered. In western culture, the mind and reason are coded masculine, whereas the body and emotion are coded feminine (Lloyd 1992). To identify the self with the rational mind is, then, to masculinize the self. If selfhood is not impossible for women, it is only because they resemble men in certain essential respects -- they are not altogether devoid of rational will. Yet, feminine selves are necessarily deficient, for they only mimic and approximate the masculine ideal.

Problematic, as well, is the way in which these gendered conceptions of the self contribute to the valorization of the masculine and the stigmatization of the feminine. The masculine realm of rational selfhood is a realm of moral decency -- principled respect for others and conscientious fidelity to duty -- and of prudent good sense -- adherence to shrewd, fulfilling, long-range life plans. However, femininity is associated with emotionally rooted concern for family and friends that spawns favoritism and compromises principles. Likewise, femininity is associated with immersion in unpredictable domestic exigencies that forever jeopardize the best-laid plans and often necessitate resorting to hasty retreats or charting new directions. By comparison, the masculinized self appears to be a sturdy fortress of integrity. How flattering! The self is essentially masculine, and the masculine self is essentially good and wise.

Feminists object that this philosophical consolidation of the preeminence of the masculine over the feminine rests on untenable assumptions about the transparency of the self, the immunity of the self to noxious social influences, and the reliability of reason as a corrective to distorted moral judgment. Today people grow up in social environments in which culturally normative prejudice persists, even in communities where overt forms of bigotry are strictly proscribed (Meyers 1994). Although official cultural norms uphold the values of equality and tolerance, cultures continue to transmit camouflaged messages of the inferiority of historically subordinated social groups through stereotypes and other imagery. These deeply ingrained schemas commonly structure attitudes, perception, and judgment despite the individual's conscious good will (Valian 1998). As a result, people often consider themselves objective and fair, and yet they systematically discriminate against "different" others while favoring members of their own social group (Piper 1990; Young 1990). Fortified by culture and ensconced in the unconscious, such prejudice cannot be dispelled through rational reflection alone (Meyers 1994). In effect, then, the Kantian moral subject countenances "innocent" wrongdoing and occluded reinforcement of the social stratification that privileges the minority of men whom this conception takes as paradigmatic.

These oversights necessitate reconceptualizing the self in two respects. To account for the residual potency of this form of prejudice, feminists urge, the self must be understood as socially situated and murkily heterogeneous. To account for the self's ability to discern and resist culturally normative prejudice, the moral subject must not be reduced to the capacity for reason.

Complementing this line of argument, a number of feminists argue that conceptualizing the self as a seamless whole has invidious social consequences. To realize this ideal, it is necessary to repress inner diversity and conflict and to police the boundaries of the purified self. Alien desires and impulses are consigned to the unconscious, but this unconscious material inevitably intrudes upon conscious life and

influences people's attitudes and desires. In particular, the feared and despised Other within is projected onto "other" social groups, and hatred and contempt are redirected at these imagined enemies (Scheman 1993; Kristeva 1991). Misogyny and other forms of bigotry are thus borne of the demand that the self be unitary together with the impossibility of meeting this demand. Worse still, these irrational hatreds cannot be cured unless this demand is repudiated, but to repudiate this demand is to be resigned to a degraded, feminized self. Far from functioning as the guarantor of moral probity, the Kantian moral subject is the condition of the possibility of intractable animosity and injustice.

Another strand of feminist critique targets homo economicus's preoccupation with independence and planning. In an eery suspension of biological reality, selves are conceived as sufficient unto themselves. No one seems to be born and raised, for birth mothers and caregivers are driven offstage (Baier 1987; Code 1987; Held 1987; Benhabib 1987; Kittay 1999). The self appears to materialize on its own, endowed with a starter set of basic desires, ready to select additional desires and construct overarching goals, and skilled in performing instrumental rationality tasks. No one's powers ever seem to deteriorate either, for time is suspended along with biology. Since dependency is denied, no morally significant preconsensual or nonconsensual entanglements at the beginning or the end of life need be acknowledged. All affiliations are to be freely chosen, and all transactions are to be freely negotiated. The repudiation of feminine caregiving underwrites the illusion of independence, and the illusion of independence underwrites homo economicus's voluntarism.

To achieve maximal fulfillment, homo economicus must organize his chosen pursuits into a rational life plan. He must decide which desires are most urgent; he must ensure that his desires are co-satisfiable; and he must ascertain the most efficient way to satisfy this set of desires. Madcap spontaneity and seat-of-the-pants improvisation are registered as defeats for "The Man with the Plan." Not only is this vision of a life governed by a self-chosen plan distinctly middleclass, it is gendered (Addelson 1994; Walker 1999). The mother coping with the vagaries of early childhood and the wife accommodating her man's plan are the antitheses of this conception of the self. Uncertain of where they are ultimately headed and seldom sure how to achieve the goals they embrace as they go along, these women violate norms of selfhood. Ironically, middleclass men who grow old also have difficulty measuring up to homo economicus's standards of control. Unable to count on continued health and vigor, unable to anticipate the onset of serious disease or disabling conditions, unable finally to outwit the grim reaper, affluent elderly men violate norms of selfhood along with women and the poor. The price of denying the relationality of the self and idolizing rational self-regulation is that full selfhood eludes all but a lucky, albeit transitory, male elite.

A further problem with this view from a feminist standpoint is that it fails to furnish an adequate account of internalized oppression and the process of overcoming it. It is common for women to comport themselves in a feminine fashion, to scale down their aspirations, and to embrace gender-compliant goals (Bartky 1990; Babbitt 1993). Feminists account for this phenomenon by explaining that women internalize patriarchal values and norms -- that is, these pernicious values and norms become integrated in the cognitive, emotional, and conative structure of the self. Once embedded in a woman's psychic economy, internalized oppression conditions her desires. To maximize satisfaction of her desires, then, would be to collaborate in her own oppression. Paradoxically, the more completely she fulfills these

desires, the worse off she becomes. Advantaged as he is, homo economicus can safely accept his desires as given and proceed without ado to orchestrate a plan to satisfy them. But women and members of other subordinated groups can ill-afford such complacency, and homo economicus's instrumental reason is too superficial a form of mastery to serve their interests (Babbitt 1993). They need a conception of the self that renders emancipatory transformation of one's values and projects intelligible.

Feminist critique exposes the partiality of the ostensibly universal Kantian ethical subject and homo economicus. These conceptions of the self are: 1) androcentric because they replicate masculine stereotypes and ideals; 2) sexist because they demean anything that smacks of the feminine; and 3) masculinist because they help to perpetuate male dominance. I leave the heterosexist, racist, ethnocentric, ableist, and classist dimensions of these conceptions to other encyclopedia articles.

2. Reclamation

Feminist critiques, we have seen, accuse regnant philosophical accounts of masculinizing the self. One corollary of this masculinized view of selfhood is that women are consigned to selflessness -- that is, to invisibility, subservient passivity, and self-sacrificial altruism.

Feminist critiques, we have seen, accuse regnant philosophical accounts of masculinizing the self. One corollary of this masculinized view of selfhood is that women are consigned to selflessness -- that is, to invisibility, subservient passivity, and self-sacrificial altruism.

This nullification of women's selfhood was once explicitly codified in law. The legal doctrine of coverture held that a woman's personhood was absorbed into that of her husband when she married (McDonagh 1996). The wife's assuming her husband's surname symbolizes this revocation of her separate identity. In addition, coverture deprived the wife of her right to bodily integrity, for rape within marriage was not recognized as a crime, nor was it illegal for a husband to beat his wife. She lost her right to property, as well, for her husband was entitled to control her earnings, and she was barred from making contracts in her own name. Lacking the right to vote or to serve on juries, she was a second-class citizen whose enfranchised husband purportedly represented her politically.

Although coverture has been rescinded, vestiges of this denial of women's selfhood can be discerned in recent legal rulings, and the doctrine remains influential in culture. For example, pregnant women remain vulnerable to legally sanctioned violations of their right to bodily integrity. Courts have forced pregnant women to submit to invasive medical procedures for the sake of the fetuses they were carrying, although no court would compel any other woman or man to undergo comparable procedures for the sake of a living individual, including a family member (Bordo 1993). Selflessness remains the pregnant woman's legal status. Moreover, the stereotype of feminine selflessness still thrives in the popular imagination. Any self-confident, self-assertive woman is out of step with prevalent gender norms, and a mother who is not unstintingly devoted to her children is likely to be perceived as selfish and face severe social censure. Despite the fact that it is no longer legally mandatory for wives to give up their maiden names, many women adhere to this custom and perpetuate this traditional gesture of self-renunciation.

A tension within feminism complicates the project of reclaiming women's selfhood, however. The claim that women are systematically subordinated and that this subordination has a grievous impact on women's lives is central to feminism. Yet, this key insight seems to belie the claim that women's selfhood and agency have been overlooked. To be unjustly subordinated, it would seem, is to be diminished in one's selfhood and to have one's agency curtailed. Otherwise, what's the harm?

Some feminists have endorsed this very position. Arguing that moral virtues have no gender, Mary Wollstonecraft regards "feminine" virtues as perversions of true human virtues and laments women's conscription into a bogus ideal (Wollstonecraft 1792). Similarly but more vividly, Simone de Beauvoir labels women "mutilated" and "immanent" (Beauvoir 1952). Socialized to objectify themselves, women become narcissistic, small-minded, and dependent on others' approval. Excluded from careers, waiting to be chosen by their future husbands, taken over by natural forces during pregnancy, busy with tedious, repetitive housework, women never become transcendent agents. Indeed, they are content not to assume the burden of responsibility for their own freedom. Cast in the role of man's Other and at the mercy of feminine vices, women succumb to bad faith and surrender their agency.

This portrayal of women as abject victims has been challenged and modulated in contemporary feminist philosophy. I shall review four major reclamation strategies: 1) rethinking the activities of mothering, 2) developing an ethic of care, 3) exploring separatist practices, and 4) reconceiving autonomy.

The conventional view of pregnancy and birth classifies them as merely biological processes, and the conventional view of mothering classifies it as a merely instinctual activity. Feminists demonstrate that these assessments are sorely mistaken. Both pregnancy and birthgiving engage women's agentic powers. Not only does pregnancy raise the question of whether to have an abortion, but also a woman's decision to proceed with a pregnancy entails learning to care for herself in previously unnecessary ways (Held 1989). In the last few decades, medical technologies, such as sonography and fetal surgery, have raised new issues for pregnant women and sometimes confront them with wrenching choices that test their agentic resilience. Arguably, routine pregnancy and birthgiving mobilize specific agentic capacities, such as "active waiting" and coping with "chosen and predictable pain" (Ruddick 1994).

A related feminist innovation focuses on analyzing the discipline of mothering to grasp its aims, its forms of thought, its ideal form, and its characteristic values and disvalues (Ruddick 1989). Caring for a child imposes a set of demands -- for preservation (survival), for growth (development into a healthy adult), and for acceptability (enculturation that ensures fitting into a community). Meeting these demands involves a range of activities that are governed by a distinctive set of values: protecting a fragile existence, acknowledging the limits of one's power and the unpredictability of events, cheerful determination to persist despite setbacks, responsive adaptability, sensitivity to the child's subjective viewpoint, and tolerance for inconclusive processes of disclosure. Although the practice of mothering places no premium on independence, self-interest, free choice, power, advance planning, or control, it clearly calls upon a wide range of interpersonal and reflective skills and enlists caregivers' agentic capacities. Dumb instinct hardly suffices for good childcare.

Like feminists who have reclaimed women's agency as mothers, feminists who have developed different versions of care ethics insist on taking women's experience seriously and use this experience as a basis for new approaches to morality and social policy. The aim of the psychological studies that first made the voice of care audible was to recognize and understand the capacities for moral judgment of women whose competency had been underrated. Previous research comparing boys' and girls' moral development had concluded that girls' development was stunted, but Carol Gilligan argues that this assessment misconstrued the data (Gilligan 1982). According to Gilligan, there are two paths of moral development. Many girls and women but almost no men follow the care trajectory (Gilligan 1987). Since earlier investigations first studied U.S. boys and men and used these interviews to generalize about people's moral development, researchers noticed only one path, namely, the justice trajectory. By repudiating the assumption that the masculine is the human norm and by studying girls and women, Gilligan discovered an alternative mode of moral cognition -- the Care Perspective. Constituted by a distinctive set of framing concepts and a distinctive set of reflective skills, the morality of care is not translatable into the morality of justice that Gilligan's predecessors had taken to be the gauge of moral development. The Care Perspective, in Gilligan's view, is a different and equally good way to interpret moral situations and to decide how to act. Moreover, by noticing this alternative, we are able to recognize women's moral agency and defend women against the age-old charge that they are morally inferior to men.

Although some feminist philosophers criticize Gilligan's investigations on empirical or philosophical grounds (Moody-Adams 1991; Friedman 1993; Card 1996; Fraser and Nicholson 1990), her research prompted a number of feminist philosophers to develop moral theories marked by quite different emphases from those of traditional moral theories. The theme of human interconnectedness and the value of intersubjectivity are prominent in contemporary feminist moral philosophy. A climate of trust forms an indispensable background for all sorts of undertakings, but no voluntaristic ethic can account for trust (Baier 1986). The ability to empathize with other individuals and imaginatively reconstruct their unique subjective viewpoints is vital to moral insight and wise moral choice, but ethics that base moral judgment on a universal conception of the person marginalize this skill (Meyers 1994). By developing narratives of one's moral identity, one's relationships, and one's values and sharing those narratives with one's associates, one endows one's life with moral meaning and integrity, but rationalistic ethics overlook this process of self-disclosure and interpersonal mediation (Walker 1998). Taking responsibility for who one is and how one shall respond is a salient feature of informal personal relationships, yet justice oriented ethics focus exclusively on being held responsible for what one has done and the credit or blame one's actions may deserve (Card 1996). Appreciating the inevitability of dependency and the need for care demonstrates the poverty of conceiving justice exclusively in terms of rights not to be interfered with and the urgency of developing a theory of justice that includes provisions for care (Kittay 1999). In each instance, feminist moral theorists revalue that which is traditionally deemed feminine -- feeling, intimacy, nurturance, and so forth. By highlighting these contexts and values, they reclaim the venues traditionally associated with women as morally significant sites, and they reclaim the moral agency of the individuals whose lives are centered in these sites.

A third approach to reclaiming women's agency spotlights several types of separatist practice -- including friendship among women, lesbianism, support groups for rape victims and battered women, and women's consciousness raising and activist groups. Establishing and maintaining such affiliations presupposes self-

willed defiance of norms of heterosexual fidelity and familial commitment. Thus, the very existence of these relationships testifies to women's awareness of their own needs and their capacity to act on them despite a repressive social context. Moreover, noting that unchosen relationships and communities of origin often prove oppressive to women and inimical to their agency, some feminists stress that it is important not to underestimate the role of chosen relationships and communities as sites of women's agency (Friedman 1993; Brison 1997; Hoagland 1988; Ferguson 1987; Frye 1983; MacKinnon 1982; Hartsock 1983). By cordoning off a social sphere of mutually attuned, mutually concerned women, separatism in all its forms turns down the racket of patriarchy. Separatist associations provide forums in which women can exchange personal confidences, secure in the knowledge that other participants will empathize with their dissatisfactions and frustrations as well as their joys and triumphs and that others will be receptive to their worries and complaints. Isolation often confounds women's subjectivity and agency, for in isolation their problems appear to be personal failings if not pathologies. Separatism overcomes isolation. It affords women the opportunity to develop language that makes sense of their anomalous experience and that restores their self-esteem together with the opportunity to reflect on the social meanings of their experience. Within separatist contexts, women find support for their resistance to social norms and their struggles to overcome personal privations or pressures.

Separatist practices relieve women of the burden of Otherness. Each woman is an equal among equals. Each woman's subjectivity and agency are affirmed. Thus, feminist philosophers seek not only to chronicle the ways in which women have created pockets of separatism within patriarchal systems but also to theorize the forms of subjectivity and agency that flourish in these sites.

Autonomy is a key issue for this theoretical project. Although some feminists dismiss autonomy as an androcentric relic of modernism (Jaggar 1983; Addelson 1994; Hekman 1995; Card 1996), others assert women's need for self-determination (de Lauretis 1986; King 1988; Lugones and Spelman 1983; Govier 1993). In light of the history of figuring women as driven by their reproductive biology and in need of rational male guidance and the history of women's enforced economic dependence on men or relegation to poorly paid, often despised forms of labor, feminists can hardly ignore the topic of self-determination. Thus, a number of feminist philosophers take up this challenge and present accounts of autonomy that do not devalue the interpersonal capacities and social contributions that are conventionally coded feminine (Nedelsky 1989; Meyers 1989 and 2000; Benhabib 1995 and 1999; Weir 1995). In feminist accounts, autonomy is not conflated with self-sufficiency and free will, but rather it is seen to be facilitated by supportive relationships and also to be a matter of degree.

Whereas standard philosophical accounts of autonomy confine their social critique to the observation that pluralistic societies that respect basic rights are more conducive to autonomy, feminist accounts point up how subordination constrains autonomy and how egalitarian communities augment it (Meyers 1989; Babbitt 1993; Benhabib 1995). Whereas standard philosophical accounts intellectualize autonomy and stress rational decision making, feminist accounts accent the role of feelings in autonomous lives (Nedelsky 1989; Meyers 1989; Weir 1995). Whereas standard philosophical accounts spotlight the autonomous individual's independence and immunity to others' influence, feminist accounts stress the autonomous individual's need for constructive feedback, advice, and encouragement (Meyers 1989; Brison 1997). Whereas standard philosophical accounts trace autonomy to endorsing and prioritizing a

coherent set of desires and goals and to scheduling fulfillment of these objectives, feminist accounts view autonomy as an ongoing and improvisational process of exercising self-discovery, self-definition, and self-direction skills (Meyers 1989 and 2000). Whereas standard philosophical accounts see autonomy as an all-or-nothing achievement, feminist accounts note how autonomy skills piggyback on seemingly unrelated ancillary skills, how autonomy skills may be exercised in certain contexts yet deactivated in others, and how different degrees of skillfulness yield varying degrees of autonomy (Friedman 1993; Meyers 1989).

Feminist accounts of autonomy strike a balance between recognizing the injury that subordination does to women's sense of self and agency and respecting the measure of autonomy women gain despite this subjugation. Subordination endangers women's autonomy in a number of ways. Not only does internalized oppression mold women's desires and alienate them from themselves, but also those in subordinate positions are offered all sorts of incentives to minimize friction and ease their lot by placating those with power (Card 1996). Likewise, well-meaning friends are all too likely to counsel the course of least resistance, namely, compliance with convention regardless of one's personal values and aspirations. Another effect of systematic subordination is that women's autonomy skills may be poorly developed or poorly coordinated, and exercising these skills is rarely rewarded and generally discouraged (Meyers 1989). Deficient autonomy skills compound the threat internalized oppression poses.

Still, feminist accounts of autonomy enable us to understand why women do not completely lack autonomy and how women's autonomy can be augmented. The self-discovery, self-definition, and self-direction skills that secure autonomy are commonplace (Meyers 1989). Indeed, some of them,such as introspective attunement to feelings and receptiveness to others' feedback, are gender-compatible for and often promoted in women. Although others, such as rational planning and self-assertion, are coded masculine, many women in fact have considerable proficiency in these areas. All too often, however, they exercise these skills only in narrowly restricted, gender-appropriate contexts. For example, a homemaker may demonstrate remarkable instrumental reason skills in running her household, or a mother may exhibit effective self-assertion skills in dealing with a teacher who has mistreated her child. Yet, these women may come off as inept, helpless, and meek in other situations. Thus, augmenting women's autonomy is often a matter of emboldening women to extend the range of application of their existing autonomy skills and fostering the development of weak skills. It is evident, then, why separatist practices of various kinds are conducive to women's autonomy. By inviting women to marshall their autonomy skills and reinforcing women's determination to carry out their decisions, they function as autonomy workshops.

Still, from a feminist perspective, separatist practices are merely transitional and ameliorative. In addition, the patriarchal social structures that relentlessly undermine women's autonomy must be changed, and women's selfhood and agency must be legally and culturally affirmed. Thus, feminist philosophers defend a variety of social policy initiatives that expand the scope of women's choices and that respect women as self-directing individuals. Feminist philosophers have been in the forefront in arguing for egalitarian families, in legitimating economic opportunity for women, in opposing harassment of women in workplaces, in defending women's reproductive rights, and in condemning violence against women in all its forms. In each instance, greater justice for women strikes a blow against the masculinized self of traditional philosophy by securing greater social recognition for the female agentic self.

3. Reconceptualizations

A. The Nature of the Self

The primary task of a philosophy of the self is to clarify what makes something a self. Feminist philosophers are acutely aware that this is not a value-free task. To get an analysis of the nature of the self off the ground, one must decide which entities count as selves (or, at least, which entities are noncontroversially counted as selves within one's linguistic community). Since we regard selves as valuable -- as members of our moral community and as worthy of respect -- these judgments are in part judgments about which entities are valuable. Moreover, values enter into these judgments because we consider selves to be the sorts of things that can achieve (or fail to achieve) ideals of selfhood. Thus, philosophical accounts of the self have implications for conceptions of what it is to lead a good life. As we have seen, many feminist philosophers argue that it is a mistake to hold that rationality alone is essential to the self and that the ideal self is transparent, unified, coherent, and independent, for they discern misogynist subtexts in the atomistic individualism of the Kantian ethical subject and homo economicus (see Section 1). It is incumbent on feminist philosophers, then, to develop more satisfactory accounts of the self -- accounts that are compatible with respect for women. Thus, a number of feminist philosophers propose reconstructions of alternative theories of the nature of the self.

Three traditions have been especially influential in recent feminist thought -- classic psychoanalysis, object relations theory, and poststructuralism. Feminist philosophers gravitate toward these approaches to understanding selfhood because they do not share the drawbacks that prompt feminist critique of the Kantian ethical subject and homo economicus. None of these approaches regards the self as homogeneous or transparent; none supposes that a self should be coherent and speak in a single voice; none removes the self from its cultural or interpersonal setting; n one sidelines the body. In appropriating these views, feminists bring out their implications in regard to gender, incorporate feminist insights into these theories, and modify the theories to address feminist concerns.

Julia Kristeva transposes the classic Freudian conception of the self and the distinction between consciousness and the unconscious into an explicitly gendered discursive framework (Kristeva 1980). For Kristeva, the self is a subject of enunciation -- a speaker who can use the pronoun ‘I’. But speakers are not unitary, nor are they fully in control of what they say because discourse is bifurcated. The symbolic dimension of language, which is characterized by referential signs and linear logic, corresponds to consciousness and control. The clear, dry prose of scientific research reports epitomizes symbolic discourse. The semiotic dimension of language, which is characterized by figurative language, cadences, and intonations, corresponds to the unruly, passion-fueled unconscious. The ambiguities and nonstandard usages of poetry epitomize semiotic discourse. These paradigms notwithstanding, Kristeva maintains that all discourse combines elements of both registers. Every intelligible utterance relies on semantic conventions, and every utterance has a tone, even if it is a dull monotone. This contention connects Kristeva's account to feminist concerns about gender and the self. Since the rational orderliness of the symbolic is culturally coded masculine while the affect-laden allure of the semiotic is culturally coded

feminine, it follows that no discourse is purely masculine or purely feminine. The masculine symbolic and the feminine semiotic are equally indispensable to the speaking subject, whatever this individual's socially assigned gender may be. It is not possible, then, to be an unsulliedly masculine self or an unsulliedly feminine self. Every subject of enunciation -- every self -- amalgamates masculine and feminine discursive modalities.

Like the unconscious in classic psychoanalytic theory, the semiotic decenters the self. One may try to express one's thoughts in definite, straightforward language, yet because of the semiotic aspects of one's utterances, what one says carries no single meaning and is amenable to being interpreted in more than one way. In Kristeva's view, this is all to the good, for accessing the semiotic -- that which is conveyed, often inadvertently, by the style of an utterance -- kindles social critique. The semiotic gives expression to repressed, unconscious material. According to Kristeva, what society systematically represses provides clues to what is oppressive about society and how society needs to be changed. Thus, she discerns a vital ethical potential in the semiotic (Kristeva 1987). Since this ethical potential is explicitly linked to the feminine, moreover, Kristeva's account of the self displaces "masculine" adherence to principle as the prime mode of ethical agency and recognizes the urgent need for a "feminine" ethical approach. Viewing the self as a "questionable-subject-in-process" -- a subject who is responsive to the encroachments of semiotic material into conscious life and who is therefore without a fixed or unitary identity -- and valorizing the dissident potential of this decentered subjectivity, Kristeva seeks to neutralize the fear of the inchoate feminine that, in her view, underwrites misogyny. In one respect, Nancy Chodorow's appropriation of object relations theory parallels Kristeva's project of reclaiming and revaluing femininity, for Chodorow's account of the relational self reclaims and revalues feminine mothering capacities. But whereas Kristeva focuses on challenging the homogeneous self and the bright line between reason, on the one hand, and emotion and desire, on the other, Chodorow focuses on challenging the self-subsisting self with its sharp self-other boundaries. Chodorow's claim that the self is inextricable from interpersonal relationships calls into question the decontextualized individualism of the Kantian ethical subject and homo economicus.

Chodorow sees the self as relational in several respects (Chodorow 1981). Every child is cared for by an adult or adults, and every individual is shaped for better or worse by this emotionally charged interaction. As a result of feelings of need and moments of frustration, the infant becomes differentiated from its primary caregiver and develops a sense of separate identity. Concomitantly, a distinctive personality emerges. By selectively internalizing and recombining elements of their experience with other people, children develop characteristic traits and dispositions. Moreover, Chodorow attributes the development of a key interpersonal capacity to nurturance. A caregiver who is experienced as warmly solicitous is internalized as a "good internal mother" (Chodorow 1980). Children gain a sense of their worthiness by internalizing the nurturance they receive and directing it toward themselves, and they learn to respect and respond to other people by internalizing their experience of nurturance and projecting it toward others. Whereas Kristeva understands the self as a dynamic interplay between the feminine semiotic and the masculine symbolic, Chodorow understands the self as fundamentally relational and thus linked to cultural norms of feminine interpersonal responsiveness. For Chodorow, the rigidly differentiated, compulsively rational, stubbornly independent self is a masculine defensive formation -- a warped form of the relational self -- that develops as a result of fathers' negligible involvement in childcare.

Feminist philosophers have noted strengths and weaknesses in both of these views. For example, Kristeva's questionable-subject-in-process seems to enshrine and endorse the very gender dichotomy that causes women so much grief. Yet, Chodorow's relational self seems to glorify weak individuation and scorn the independence and self-assertiveness that many women desperately need. Still, Kristeva's analyses of the psychic, social, and political potency of gender figurations underscore the need for feminist counter-imagery to offset culturally entrenched, patriarchal images of womanhood. And Chodorow's appreciation of the relational self together with her diagnosis of the damage wrought by hyperindividuation advances feminist demands for equitable parenting practices. These contributions notwithstanding, both of these views have come under attack for heterosexist biases as well as for inattention to other forms of difference among women.

Critical race theorists and poststructuralists have been particularly vocal about this failure to come to grips with the diversity of gender, and they have offered accounts of the self designed to accommodate difference. Poststructuralist Judith Butler maintains that personal identity -- the sense that there are answers to the questions ‘who am I?’ and ‘what am I like?’ -- is an illusion (Butler 1990). The self is merely an unstable discursive node -- a shifting confluence of multiple discursive currents -- and sexed/gendered identity is merely a "corporeal style" -- the imitation and repeated enactment of ubiquitous norms. For Butler, psychodynamic accounts of the self, including Kristeva's and Chodorow's, camouflage the performative nature of the self and collaborate in the cultural conspiracy that maintains the illusion that one has an emotionally anchored, interior identity that is derived from one's biological nature, which is manifest in one's genitalia. Such accounts are pernicious. In concealing the ways in which normalizing regimes deploy power to enforce the performative routines that construct "natural" sexed/gendered bodies together with debased, "unnatural" bodies, they obscure the arbitrariness of the constraints that are being imposed and deflect resistance to these constraints. The solution, in Butler's view, is to question the categories of biological sex, polarized gender, and determinate sexuality that serve as markers of personal identity, to treat the construction of identity as a site of political contestation, and to embrace the subversive potential of unorthodox performances and parodic identities.

African American feminists are less sanguine than poststructuralists about the felicitous social impact of playful deviations from norms and the laughter they may prompt (Williams 1991; Crenshaw 1993). Nevertheless, some of them have adapted poststructuralist theory to the purposes of critical race theory. Noting that gender, race, and class stratification do not operate in isolation from one another but rather interact to produce compound effects, these theorists conceive of the individual as an intersectional subject -- a site where structures of domination and subordination converge (King 1988; Crenshaw 1993). Intersectional theory does not purport to offer a comprehensive theory of the self. Its aim is to capture those aspects of selfhood that are conditioned by membership in subordinated or privileged social groups. Accenting the liabilities of belonging to more than one subordinated group, Kimberle Crenshaw likens the position of such individuals to that of a pedestrian hit by several speeding vehicles simultaneously, and Maria Lugones likens their position to that of a stateless border-dweller who is not at home anywhere (Crenshaw 1991; Lugones 1992). Nevertheless, some theorists of mixed ancestry embrace border-dwelling as a model of positive identity (Anzaldua 1987; Alcoff 1995). Moreover, proponents of the intersectional self credit multiply oppressed people with a certain epistemic advantage. In virtue of their

suffering and alienation, these individuals are well situated not only to discern which values and practices in their heritage deserve allegiance but also to identify shortcomings in the traditions of the groups to which they belong. Thus, African American women are acutely aware of racism within feminism and sexism within the struggle for racial justice. Their intersectional positioning and subjectivity makes such insight virtually unavoidable.

By and large, recent feminist philosophy of the self reflects skepticism about modernist, unitary accounts of the self. In seeking to remedy the androcentric biases of the latter views, feminist philosophers emphasize features of selfhood that other philosophical schools neglect, including intersubjectivity, heterogeneity, and social construction. Still, some contemporary feminist philosophers express concern that the sorts of conceptions I have sketched are detrimental to feminist aims. Influenced by Jurgen Habermas's communicative ethics, Seyla Benhabib refuses to join poststructuralists in declaring the death of the autonomous, self-reflective individual who is capable of taking responsibility and acting on principle (Benhabib 1995). Although Benhabib is committed to viewing people as socially situated, interpersonally bonded, and embodied, she is also committed to the feasibility of rational philosophical justification of universal moral norms. Moreover, she argues that a narrative conception of the self renders the idea of a core self and coherent identity intelligible without suppressing difference and without insulating the self from social relations (Benhabib 1999). Autobiographical stories can include the many voices within us and the many relationships we have experienced, and these stories are constantly under revision, for they are always being contested by our associates' disparate self-narratives with their divergent versions of events. Nevertheless, these narratives do not collapse into incoherence, and they presuppose a core capacity to describe and reflect on one's experience. For Benhabib, this view of selfhood and reason is indispensable to feminist emancipatory objectives.

B. Gender and Identity

Postmodern challenges to the idea of a stable self and to the coherence of the category woman' have sparked a lively debate about the relation between gender and the self. If there is no such thing as a self with persistent attributes, it seems that gender cannot be a feature of every woman's identity. But if there is nothing that all women have in common, it seems that there are no interests that all women share, and there is nothing for feminism to be about. Several feminist philosophers have proposed accounts of the relation between gender and the self that aim to rescue feminism from this reductio. Linda Alcoff rejects both the universalized conceptions of gender that cultural feminists advocate and the deconstructions of the category ‘woman’ that poststructuralist feminists tender. Her alternative is to construe femininity as "positionality." Positionality has two dimensions (Alcoff 1994). First, it is the social context that locates the individual and that deprives her of power and mobility. Second, it is a political point of departure -- the affirmation of women's collective right to take charge of their gendered identity. To be a woman is, then, to be deprived of equality, and to be a feminist is to take responsibility for redressing this wrong and for redefining the meaning of being a woman. Alcoff salvages the category ‘woman’ by defending an interpretation of the social meaning of being assigned to that category.

Iris Young introduces an additional layer of analysis. To explain gender, Young invokes Jean-Paul Sartre's idea of seriality (Young 1994). A social series is "a social collective whose members are unified

passively by the objects around which their actions are oriented or by the objectified results of the material effects of the actions of others." In other words, a series is constituted by a behavior-directing, meaning-defining environment. The lives of series members are affected by being assigned to particular social series, for serial existence is experienced as a "felt necessity." People feel impelled to act in ways that are consonant with their series memberships. Yet, series membership "does not define the person's identity in the sense of forming his/her individual purposes, projects, and sense of self in relation to others." Indeed, a woman "can choose to make none of her serial memberships important for her sense of identity." For Young, then, a gendered self is optional although membership in the series ‘woman’ is not.

Sally Haslanger underscores three conceptions of ‘gender’, and her distinctions clear up much of what seems puzzling in Alcoff's and Young's views (Haslanger 2000). Haslanger argues in favor of a "critical analytical" approach to gender -- that is, focusing on the "work the concepts of gender and race might do for us in a critical -- specifically feminist and antiracist -- social theory" and suggesting "concepts that can accomplish at least some important elements of that work." To pursue this politicized approach to gender, it is necessary to decide which conception of gender best serves the aims of emancipatory political theory and politics. As Haslanger points out, feminist theorists have interpreted gender as the experience of sexed embodiment, a broad psychological orientation to the world, a set of internalized norms, a system of sexual symbolism, a set of traditional roles, and a social position or class. In her view, the principal task for feminist theory is to provide an analysis of gender as a "pattern of social relations that constitute the social classes of men as dominant and women as subordinate." The other forms of gender, including gendered identity, should be explained in terms of this fundamental structure.

Like Alcoff and Young, Haslanger is acutely aware of the political damage essentialist theories of gender have done -- especially, the alienation of women of color and lesbians from feminism -- and also the factual shortcomings of essentialist theories of gender -- that is, many women do not fit the proposed accounts of what it is to be a woman. Although none of these feminist philosophers repudiates the conception of gender as a gendered self, each treats this conception as secondary or derivative. Alcoff politicizes gendered identity and ties it to a self-ascribed commitment to progressive social change. Young stresses the indeterminacy of gendered identity and allows that women's gender-based political commitments can be antifeminist as well as feminist. Although Haslanger insists that the connections between gender as social class and gendered identities are highly variable, she claims that gender "implicates each of us at the heart of our self-understandings," and she advocates conscientious reflection on "who we think we are."

Alcoff remarks that every woman's subjectivity is engendered; Young observes that every woman's identity is marked by gender; and Haslanger notes that every woman is invested in her gender. From the standpoint of a feminist philosophy of the self, it is crucial to account for this engendering, marking, and investment. In my view, the alternative to a common homogeneous feminine identity is gendered and individualized identities (Meyers forthcoming 2000). Individualization does not, however, entail optionality, for gender insinuates itself into identity in ways that we may not be conscious of and in ways that we may not be able to change no matter how much we try. Gender is constitutive of who we are -- our personalities, our capabilities and liabilities, our aspirations, and how we feel about all of these attributes. Yet, there is no feature of identity that all women share. How is this possible? Nancy

Chodorow uses psychoanalytic theory to make sense of individualized, gendered identities (Chodorow 1995). Psychoanalysis explains how individuals' affective dispositions, unconscious fantasies, and interpersonal relationships filter the culturally entrenched conception of gender they encounter. Through various psychic processes -- projection and introjection together with the defense mechanisms -- gender acquires a "personal meaning" that is inspired by, but that does not wholly replicate culturally transmitted strictures and iconography.

It is a mistake to picture gender as a toxic capsule full of norms and interpretive schemas that individuals swallow whole and that lodges intact in their psychic structure. The diversity of individuals' experience of gender belies this view. But it is also a mistake to picture attributes like gender as systems of social and economic opportunities, constraints, rewards, and penalties that need not impinge upon individual identity. The seeming naturalness of enacting gendered characteristics, the passion with which people cling to their sense of their gender, and the intractability of many gendered attributes when people seek to change them testify to the embeddedness of gender in identity. Still, it is important to recognize, as Alcoff, Young, Haslanger, and Chodorow do, that the potency of the impact of gender on the self does not altogether deprive women of control over their gendered attributes. Neither personal resistance to one's own gendered dispositions and evaluative standards nor political resistance to the social structures that gender women's identities is ruled out on this view (See Section 2).

4. Conclusion

As this article attests, there is tremendous foment and variety within the field of feminist work on the self. Yet, in reviewing this literature, I have been struck by a recurrent theme -- the inextricability of metaphysical issues about the self from moral and political theory. Feminist critiques of regnant philosophical theories of the self expose the normative underpinnings of these theories. Feminist analyses of women's agentic capacities both acknowledge traditional feminine social contributions and provide accounts of how women can overcome oppressive norms and practices. Feminist reconstructions of the nature of the self are interwoven with arguments that draw out the emancipatory benefits of conceiving the self one way rather than another. There is nothing surprising, to be sure, about the salience of normative concerns in feminist philosophizing. Still, I mention it because I believe that feminists' attention to political concerns leads to fresh questions and also that asking novel questions enriches philosophical understanding of the self. Moreover, I would urge that this forthrightness about the political viewpoint that informs philosophy is a virtue, for overlooking the political suppositions and implications of esoteric philosophical views has led to considerable mischief.

Bibliography

Comprehensive Bibliography

In the interests of concision and readability, the present essay mentions only some of the representative works on the feminist literature on the self. These cited works are collated in the Bibliography which

appears in the next section of this essay. However, the feminist literature on the self is vast. Lisa Cassidy has put together a comprehensive bibliography of this literature; it attempts to cite all of the books and articles that are relevant to the present entry. This comprehensive bibliography is linked into the present essay as the following supplementary document:

Comprehensive Bibliography of Feminist Perspectives on the Self (by Lisa Cassidy)

Readers are therefore encouraged to pursue additional references by following the above link.

Supplement to Feminist Perspectives on the Self

Comprehensive Bibliography on Feminist Perspectives on the Self

Introduction

This bibliography serves as a supplement to Diana Tietjens Meyers' entry "Feminist Perspectives on the Self". I hope it will be useful to philosophers as well as a general audience. All the listings are written in English. Individual chapters in anthologies are cited, and all the mentioned anthologies are also listed separately. Although I have tried to be thorough, my apologies are offered in advance for misclassifying

or omitting relevant pieces.

This Bibliography is up to date with respect to publications prior to March 1997. Because the feminist literature on the self is voluminous, it is organized around three central philosophical disciplines: metaphysics, epistemology, and social philosophy.

- Metaphysical treatments of the self address the question ‘What is the self?’. Four sub-categories are included: agency, the body, gender & identities, and personhood.
- Epistemological treatments of the self ask ‘What and how do we gain knowledge of the self?’. Three sub-categories are included: emotional knowledge, self-knowledge, and knowledge of others & women's ways of knowing.
- Social treatments of the self have a dual aspect of ethics and politics. The key question addressed is ‘What are the ethics and/or politics of the self?’. Seven sub-categories are included: care ethics, critiques of individualism, ethical & political theory, families & friendship, self-respect, social groups, and violence & self.

Two additional interdisciplinary categories are included: literary & cultural studies and psychology & psychoanalysis.

Leibniz's Philosophy of Mind

In a more popular view, Leibniz's place in the history of the philosophy of mind is best secured by his pre-established harmony, that is, roughly, by the thesis that there is no mind-body interaction strictly speaking, but only a non-causal relationship of harmony, parallelism, or correspondence between mind and body. Certainly, the pre-established harmony is important for a proper understanding of Leibniz's philosophy of mind, but there is much more to be considered as well, and even in connection with the pre-established harmony, the more popular view needs to be refined, particularly insofar as it suggests that Leibniz accepts a roughly Cartesian, albeit non-interactionist dualism, which he does not. In fact, Leibniz is justly famous for his critiques, not only of materialism, but also of such a dualism. (Whether Leibniz accepts, throughout his maturity, the idealistic view that all substances are simple unextended substances or monads is an important interpretive issue that has been discussed widely in recent years. We shall not try to resolve the issue here.) In short, Leibniz made important contributions to a number of classical topics of the philosophy of mind, including materialism, dualism, idealism and mind-body interaction.

But Leibniz has much to say about the philosophy of mind that goes well beyond these traditionally important topics. Perhaps surprisingly, his system sometimes contains ideas of relevance even to contemporary discussions in the cognitive sciences. More generally, he discusses in depth the nature of perception and thought (conscious and unconscious), and of human motivation and striving (or, as he would say, appetition). We will take up such topics in what follows.

1. Matter and Thought

For present purposes, we may think of materialism as the view that everything that exists is material, or

physical, with this view closely allied to another, namely, that mental states and processes are either identical to, or realized by, physical states and processes. Leibniz remained opposed to materialism throughout his career, particularly as it figured in the writings of Epicurus and Hobbes. The realms of the mental and the physical, for Leibniz, form two distinct realms—but not in a way conducive to dualism, or the view that there exists both thinking substance, and extended substance. By opposing both materialism and dualism, Leibniz carved himself an interesting place in the history of views concerning the relationship between thought and matter.

Most of Leibniz's arguments against materialism are directly aimed at the thesis that perception and consciousness can be given mechanical (i.e. physical) explanations. His position is that perception and consciousness cannot *possibly* be explained mechanically, and, hence, could not be physical processes. His most famous argument against the possibility of materialism is found in section 17 of the *Monadology* (1714):

> One is obliged to admit that *perception* and what depends upon it is *inexplicable on mechanical principles*, that is, by figures and motions. In imagining that there is a machine whose construction would enable it to think, to sense, and to have perception, one could conceive it enlarged while retaining the same proportions, so that one could enter into it, just like into a windmill. Supposing this, one should, when visiting within it, find only parts pushing one another, and never anything by which to explain a perception. Thus it is in the simple substance, and not in the composite or in the machine, that one must look for perception.

Leibniz's argument seems to be this: the visitor of the machine, upon entering it, would observe nothing but the properties of the parts, and the relations they bear to one another. But no explanation of perception, or consciousness, can possibly be deduced from this conglomerate. No matter how complex the inner workings of this machine, nothing about them reveals that what is being observed are the inner workings of a conscious being. Hence, materialism must be false, for there is no possible way that the purely mechanical principles of materialism can account for the phenomena of consciousness.

In other writings, Leibniz suggests exactly what characteristic it is of perception and consciousness that the mechanical principles of materialism cannot account for. The following passages, the first from the *New System of Nature* (1695), the second from the *Reply to Bayle* (1702), are revealing in this regard:

> Furthermore, by means of the soul or form, there is a true unity which corresponds to what is called the *I* in us; such a thing could not occur in artificial machines, nor in the simple mass of matter, however organized it may be.

> But in addition to the general principles which establish the monads of which compound things are merely the results, internal experience refutes the Epicurean [i.e. materialist] doctrine. This experience is the consciousness which is in us of this *I* which apperceives things which occur in the body. This perception cannot be explained by figures and movements.

Leibniz's point is that whatever is the subject of perception and consciousness must be truly one, a single "I" properly regarded as *one* conscious being. An aggregate of matter is not truly one and so cannot be regarded as a single *I*, capable of being the subject of a unified mental life. This interpretation fits nicely with Lebniz's oft-repeated definition of perception as "the representation in the simple of the compound, or of that which is outside" (*Principles of Nature and Grace*, sec.2 (1714)). More explicitly, in a letter to Antoine Arnauld of 9 October 1687, Leibniz wrote that "in natural perception and sensation, it is enough for what is divisible and material and dispersed into many entities to be expressed or represented in a single indivisible entity or in a substance which is endowed with genuine unity." If perception (and hence, consciousness) essentially involves a representation of a variety of content in a simple, indivisible "I," then we may construct Leibniz's argument against materialism as follows: Materialism holds that matter can explain (is identical with, can give rise to) perception. A perception is a state whereby a variety of content is represented in a true unity. Thus, whatever is not a true unity cannot give rise to perception. Whatever is divisible is not a true unity. Matter is infinitely divisible. Hence, matter cannot form a true unity. Hence, matter cannot explain (be identical with, give rise to) perception. If matter cannot explain (be identical to, give rise to) perception, then materialism is false. Hence, materialism is false.

Leibniz rejected materialism on the grounds that it could not, in principle, ever capture the "true unity" of perceptual consciousness, that characteristic of the self which can simultaneously unify a manifoldness of perceptual content. If this is Leibniz's argument, it is of some historical interest that it bears striking resemblances to contemporary objections to certain materialist theories of mind. Many contemporary philosophers have objected to some versions of materialism on the basis of thought experiments like Leibniz's: experiments designed to show that qualia and consciousness are bound to elude certain materialist conceptions of the mind (cf. Searle 1980; Nagel 1974; McGinn 1989; Jackson 1982).

Leibniz's rejection of materialist conceptions of the mind was coupled with a strong opposition to dualistic views concerning the relationship between mind and body, particularly the substance dualism that figured in the philosophy of Descartes and his followers. According to this dualism, the world fundamentally consists of two disparate substances: extended material substance (body) and unextended thinking substance (mind). This bifurcation, of course, carries no burden of holding that the operations of the mental are realized by the operations of the physical. But despite his claim that consciousness and perception cannot be realized by, nor reduced to, the mechanical operations of matter, Leibniz found the alternative of postulating two distinct kinds of substance equally implausible.

Leibniz's opposition to Cartesian dualism stems not from a rejection of unextended substance, but from his denial of the existence of genuine extended material substance. To begin with, Leibniz held the Scholastic thesis that "being" and "one" are equivalent. He writes to Arnauld: "To be brief, I hold as axiomatic the identical proposition which varies only in emphasis: that what is not truly *one* being is not truly one *being* either" (30 April 1687). For Leibniz, in order for something to count as a real being—a substance—it must be "truly one," or an entity endowed with genuine unity. And, as we saw above, in order for something to be a genuine unity, it must be a simple, indivisible entity. "Substantial unity," he writes, "requires a complete, indivisible and naturally indestructible entity" (to Arnauld, 28 November 1686). But matter is extended, and thus, Leibniz believes, infinitely divisible. Hence, there is no such

thing, for Leibniz, as material substance.

There is a positive thesis which goes hand-in-hand with Leibniz's negative thesis against material substance, and which helps to explain further his rejection of material substance. It is summarized in the following passage from a letter to Arnauld of 30 April 1687:

> I believe that *where there are only beings through aggregation, there will not even be real beings*. For every being through aggregation presupposes beings endowed with a true unity, because it obtains its reality from nowhere but that of its constituents, so that it will have no reality at all if each constituent being is still an entity through aggregation; or else, one must yet seek another basis to its reality, which in this way, if one must constantly go on searching, can never be found…. If there are aggregates of substances, there must also be genuine substances from which all the aggregates result. One must therefore necessarily arrive either at mathematical points from which certain authors make up extension, or at Epicurus' and M. Cordemoy's atoms (which you, like me, dismiss), or else one must acknowledge that no reality can be found in bodies, or finally one must recognize certain substances in them that possess a true unity.

According to Leibniz, bodies (qua material) are aggregates, and an aggregate, of course, is not a substance on account of its lack of unity. The claim in the above passage is that whatever being, or reality, an aggregate has derives from the being and reality of its constituents. Thus, Leibniz thinks that if a body is to have any reality at all, if it is to be more than a mere "phenomenon, lacking all reality as would a coherent dream," then it must ultimately be composed of things which are real beings. Atoms, he claims, are unfit for this role, because they are themselves extended beings, and for Leibniz, divisibility is of the essence of extension. That is, those who believe in indivisible atoms make matter "divisible in one place, indivisible in another" (*On Nature Itself* (1698)), but "we cannot explain why bodies of a definite smallness [i.e. atoms] should not be further divisible" (*Primary Truths* (1686)). Every extended mass, for Leibniz, is composed of extended parts, and so even if we could conceive of an atom as composed of parts which cannot be physically divided, "an invincible attachment of one part to another would not at all destroy the diversity of these parts" (*New System of Nature*, (1695)), or it would not at all overcome the fact that it is an aggregate composed of parts, and not truly one being. Likewise, mathematical points, "even an infinity of points gathered into one, will not make extension," (to Des Bosses, 30 April 1709) and so cannot be understood as the constituents of extended bodies. Hence, Leibniz opts for the last of the above quoted alternatives: the constituents of bodies are "certain substances … that possess a true unity." These substances are partless, unextended, and indivisible, and therefore real beings in Leibniz's sense. Indeed, in several writings, Leibniz invites us to conceive of these substances on the model of our notion of souls. These simple substances are the only things which suffice for grounding the reality of bodies. To be sure, substances, Leibniz tells us, do not constitute a body as parts of the body, but as the "first elements," or "primitive unities," of the body. As he sometimes puts it, bodies "result from" these constitutive unities. That is, bodies just are aggregates of substances which *appear to us* as extended corporeal phenomena, though they are "well-founded" phenomena; they have their foundation in real beings.

In short, Leibniz stands in a special position with respect to the history of views concerning thought and its relationship to matter. He rejects the materialist position that thought and consciousness can be captured by purely mechanical principles. But he also rejects the dualist position that the universe must therefore be bifurcated into two different kinds of substance, thinking substance, and material substance. Rather, it is his view that the world consists solely of one *type* of substance, though there are infinitely many substances of that type. These substances are partless, unextended entities, some of which are endowed with thought and consciousness, and others of which found the phenomenality of the corporeal world. The sum of these views secures Leibniz a distinctive position in the history of the philosophy of mind.

2. Denial of Mind-Body Interaction, Assertion of Pre-established Harmony

A central philosophical issue of the seventeenth century concerned the apparent causal relations which hold between the mind and the body. In most seventeenth-century settings this issue was discussed within the context of substance dualism, the view that mind and body are different kinds of substance. For Leibniz, this is a particularly interesting issue in that he remained fundamentally opposed to dualism. But although Leibniz held that there is only one type of substance in the world, and thus that mind and body are ultimately composed of the same kind of substance (a version of monism), he also held that mind and body are metaphysically distinct. There are a variety of interpretations of what this metaphysical distinctness consists in for Leibniz, but on any plausible interpretation it is safe to assume (as Leibniz seems to have done) that for any person *P*, *P*'s mind is a distinct substance (a soul) from *P*'s body. With this assumption in hand, we may formulate the central issue in the form of a question: how is it that certain mental states and events are coordinated with certain bodily states and events, and vice-versa? There were various attempts to answer this question in Leibniz's time period. For Descartes, the answer was mind-body interactionism: the mind can causally influence the body, and (most commentators have held) vice-versa. For Malebranche, the answer was that neither created minds nor bodies can enter into causal relations because God is the only causally efficient being in the universe. God causes certain bodily states and events on the occasion of certain mental states and events, and vice-versa. Leibniz found Descartes' answer unintelligible (cf. *Theodicy*, sec. 60), and Malebranche's excessive because miraculous (cf. Letter to Arnauld, 14 July 1686).

Leibniz's account of mind-body causation was in terms of his famous doctrine of the *preestablished harmony*. According to the latter, (1) no state of a created substance has as a real cause some state of another created substance (i.e. a denial of inter-substantial causality); (2) every non-initial, non-miraculous, state of a created substance has as a real cause some previous state of that very substance (i.e. an affirmation of intra-substantial causality); and (3) each created substance is programmed at creation such that all its natural states and actions are carried out in conformity with all the natural states and actions of every other created substance.

Formulating (1) through (3) in the language of minds and bodies, Leibniz held that no mental state has as

a real cause some state of another created mind or body, and no bodily state has as a real cause some state of another created mind or body. Further, every non-initial, non-miraculous, mental state of a substance has as a real cause some previous state of that mind, and every non-initial, non-miraculous, bodily state has as a real cause some previous state of that body. Finally, created minds and bodies are programmed at creation such that all their natural states and actions are carried out in mutual coordination.

According to Leibniz, what *appear* to be real causal relations between mind and body are, in metaphysical reality, the mutual conformity or coordination of mind and body—in accordance with (3)—with no interaction or divine intervention involved. For example, suppose that Smith is pricked with a pin (call this bodily state *Sb*) and pain ensues (call this mental state *Sm*), a case of apparent body to mind causation. Leibniz would say that in such a case some state of Smith's mind (soul) prior to *Sm* was the real cause of *Sm,* and *Sb* was not a causal factor in the obtaining of *Sm*. Suppose now that Smith has a desire to raise his arm (call this mental state *Sm*), and the raising of his arm ensues (call this bodily state *Sb*), a case of apparent mind to body causation. Leibniz would say that in such a case some state of Smith's body prior to *Sb* was the real cause of *Sb* and *Sm* was not a causal factor in the obtaining of *Sb*. So although substances do not causally interact, their states accommodate one another as if there were causal interaction among substances.

It should be noted, however, that Leibniz did think that there was a sense in which one could say that mental events influence bodily events, and vice-versa. He wrote to Antoine Arnauld that although “one particular substance has no physical influence on another … nevertheless, one is quite right to say that my will is the cause of this movement of my arm …; for the one expresses distinctly what the other expresses more confusedly, and one must ascribe the action to the substance whose expression is more distinct” (28 November 1686 (draft)). In this passage, Leibniz sets forth what he takes the metaphysical reality of apparent inter-substantial causation to amount to. We begin with the thesis that every created substance perceives the entire universe, though only a portion of it is perceived distinctly, most of it being perceived unconsciously, and, hence, confusedly. Now consider two created substances, *x* and *y* (*x* not identical to *y*), where some state of *x* is said to be the cause of some state of *y*. Leibniz's analysis is this: when the causal state of affairs occurred, the relevant perceptions of substance *x* became more distinct, while the relevant perceptions of substance *y* became more confused. Insofar as the relevant perceptions of *x* become increasingly distinct, it is “causally” active; insofar as the relevant perceptions of substance *y* become increasingly confused, it is passive. In general, causation is to be understood as an increase in distinctness on the part of the causally active substance, and an increase in confusedness on the part of the passively effected substance. Again, each substance is programmed at creation to be active/passive at the relevant moment, with no occurrence of real substantial interaction.

It is difficult to say exactly why Leibniz denied inter-substantial causation. Some of the things he tells us, in both private and public writings, seem unsatisfactory for one reason or another. For example, in *Primary Truths* (1686?), we are given this:

> Strictly speaking, one can say that *no created substance exerts a metaphysical action or influx on any other thing*. For, not to mention the fact that one cannot explain how something can pass from one thing into the substance of another, we have already shown

> that from the notion of each and every thing follows all of its future states. What we call causes are only concurrent requisites, in metaphysical rigor.

Here Leibniz gives a reason tied to his complete concept theory of substance, according to which “the nature of an individual substance or of a complete being is to have a notion so complete that it is sufficient to contain and to allow us to deduce from it all the predicates of the subject to which this notion is attributed” (*Discourse on Metaphysics*, sec. 8). But there are, it seems, at least two problems with this explanation. First, Leibniz moves rather quickly from a conceptual explanation of substance in terms of the complete concept theory, to the conclusion that this consideration is sufficient to explain the activity of concrete substances. Second, even if conceptual considerations about substances were sufficient to explain their apparent causal activity, it does not seem to follow that substances do not interact—unless one is assuming that causal overdetermination is not a genuine possibility. Leibniz seems to be assuming just that, but without argument.

Sometimes Leibniz gives a more familiar line of reasoning. At *Monadology* 7, we read this:

> There is no way of explaining how a monad can be altered or changed internally by some other creature, since one cannot transpose anything in it, nor can one conceive of any internal motion that can be excited, directed, augmented, or diminished within it, as can be done in composites, where there can be change among the parts. The monads have no windows through which something can enter or leave. Accidents cannot be detached, nor can they go about outside of substances, as the sensible species of the Scholastics once did. Thus, neither substance nor accident can enter a monad from without.

He seems to think that causal interaction between two beings requires the transmission or transposition of the parts of those beings. But substances are simple unextended entities which contain no parts. Thus, there is no way to explain how one substance could influence another. Unfortunately, however, this line of reasoning would seem to also rule out one case of inter-substantial causation which Leibniz allows, viz., God's causal action on finite simple substances.

3. Language and Mind

Some scholars have suggested that Leibniz should be regarded as one of the first thinkers to envision something like the idea of artificial intelligence (cf. Churchland 1984; Pratt 1987). Whether or not he should be regarded as such, it is clear that Leibniz, like contemporary cognitive scientists, saw an intimate connection between the form and content of language, and the operations of the mind. Indeed, according to his own testimony in the *New Essays*, he “really believe[s] that languages are the best mirror of the human mind, and that a precise analysis of the signification of words would tell us more than anything else about the operations of the understanding” (bk.III, ch.7, sec.6 (RB, 333)). This view of Leibniz's led him to formulate a plan for a “universal language,” an artificial language composed of symbols, which would stand for concepts or ideas, and logical rules for their valid manipulation. He believed that such a language would perfectly mirror the processes of intelligible human reasoning. It is this plan that has led

some to believe that Leibniz came close to anticipating artificial intelligence. At any rate, Leibniz's writings about this project (which, it should be noted, he never got the chance to actualize) reveal significant insights into his understanding of the nature of human reasoning. This understanding, it turns out, is not that different from contemporary conceptions of the mind, as many of his discussions bear considerable relevance to discussions in the cognitive sciences.

According to Leibniz, natural language, despite its powerful resources for communication, often makes reasoning obscure since it is an imperfect mirror of intelligible thoughts. As a result, it is often difficult to reason with the apparatus of natural language, “since it is full of innumerable equivocations” (*On the Universal Science: Characteristic* (undated); G VII, 205 (S, 18)). Perhaps this is because of his view that the terms of natural language stand for complex, or derivative, concepts—concepts which are composed of, and reducible to, simpler concepts. With this “combinatorial” view of concepts in hand, Leibniz notices “that all human ideas can be resolved into a few as their primitives” (*On the Universal Science: Characteristic*; G VII, 205 (S, 18)). We could then assign symbols, or “characters,” to these primitive concepts from which we could form characters for derivative concepts by means of combinations of the symbols. As a result, Leibniz tells us, “it would be possible to find correct definitions and values and, hence, also the properties which are demonstrably implied in the definitions” (*On the Universal Science: Characteristic*; G VII, 205 (S, 19)). The totality of these symbols would form a “universal characteristic,” an ideal language in which all human concepts would be perfectly represented, and their constitutive nature perfectly transparent. Now it is true that Leibniz eventually came to doubt “whether any concept of this [primitive] kind appears distinctly to men, namely, in such a way that they know they have it” (*An Introduction to a Secret Encyclopedia* (1679?); C, 513 (MP, 7)). But it is also clear that he did not see this skepticism concerning our ability to reach the primitive concepts as much of a barrier to the project of a universal language. He writes in *The Art of Discovery* (1685) that “there are certain primitive terms which can be posited, if not absolutely, at least relatively to us” (C, 176 (W, 51)). The suggestion seems to be that even if we cannot provide a catalog of absolutely primitive concepts, we can nevertheless construct a characteristic based on concepts which cannot be further resolved by humans.

In addition to the resolution of concepts, and their symbolic assignments, Leibniz envisages the formulation of logical rules for the universal characteristic. He claims that “it is plain that men make use in reasoning of several axioms which are not yet quite certain” (*The Method of Certitude and the Art of Discovery* (undated); G VII, 183 (W, 49)). Yet with the explicit formulation of these rules for the logical manipulation of the symbols—rules which humans use in reasoning—we would be in possession of a universal language which would mirror the relations between the concepts used in human reasoning. Indeed, the universal characteristic was intended by Leibniz as an instrument for the effective calculation of truths. Like formal logic systems, it would be a language capable of representing valid reasoning patterns by means of the use of symbols. Unlike formal logic systems, however, the universal language would also express the content of human reasoning in addition to its formal structure. In Leibniz's mind, “this language will be the greatest instrument of reason,” for “when there are disputes among persons, we can simply say: Let us calculate, without further ado, and see who is right” (*The Art of Discovery* (1685); C, 176 (W, 51)).

Judging from Leibniz's plans for a universal language, it is clear that Leibniz had a specific view about the

nature of human cognitive processes, particularly about the nature of human reasoning. According to this view, cognition is essentially symbolic: it takes place in a system of representations which possesses language-like structure. Indeed, it was Leibniz's view that “all human reasoning uses certain signs or characters,” (*On the Universal Science: Characteristic*; G VII, 204 (S, 17)) and “if there were no characters, we could neither think of anything distinctly nor reason about it” (*Dialogue* (1677); G VII, 191 (A&G, 271)). Add to this conception Leibniz's view that human cognitive processes follow determinable axioms of logic, and the picture that emerges is one according to which the mind operates, at least when it comes to intelligible reasoning, by following implicit algorithmic procedures. Regardless of whether or not Leibniz should be seen as the grandfather of artificial intelligence, he did conceive of human cognition in essentially computational terms. In fact, as early as 1666, remarking favorably on Hobbes' writings, Leibniz wrote: “Thomas Hobbes, everywhere a profound examiner of principles, rightly stated that everything done by our mind is a *computation*” (*On the Art of Combinations* (1666); G IV, 64 (P, 3)).

4. Perception and Appetition

What do we find in the human mind? Representations on the one hand, and tendencies, inclinations, or strivings on the other, according to Leibniz. Or, to put this in Leibniz's more customary terminology, what is found within us is perception and appetition. For human minds count for Leibniz as simple substances, and, as he says in a letter to De Volder, “it may be said that there is nothing in the world except simple substances, and, in them, perception and appetite.” (30 June 1704)

Perception has already been discussed briefly above. But it will be advisable to consider also a definition from a letter to Des Bosses (and echoed in many other passages), in which Leibniz discusses perception as the representation or “expression” of “the many in the one” (letter to Des Bosses, 11 July 1706). We shall return to this definition below. Appetitions are explained as “tendencies from one perception to another” (*Principles of Nature and Grace*, sec.2 (1714)). Thus, we represent the world in our perceptions, and these representations are linked with an internal principle of activity and change (*Monadology*, sec.15 (1714)) which, in its expression in appetitions, urges us ever onward in the constantly changing flow of mental life. More technically explained, the principle of action, that is, the primitive force which is our essence, expresses itself in momentary derivative forces involving two aspects: on the one hand, there is a representative aspect (perception), by which that the many without are expressed within the one, the simple substance; on the other, there is a dynamical aspect, a tendency or striving towards new perceptions, which inclines us to change our representative state, to move towards new perceptions.

It should not be inferred that this appetitive tendency to change is entirely mechanistic, entirely governed by efficient causation only. For in Leibniz's view, value and final causes are not excluded from the action of the mind, the change of mental states. As he says in section 13 of the *Discourse on Metaphysics* (1686), just as “God will always do the best, … a man shall always do … that which appears to him to be the best.” Appearance, of course, has to do with perception; doing, with appetition. So this principle of human action applies directly, as one would expect, to the two key factors of monadic interior life, only with the role of value, or an end in view, now more clearly in focus. This is why Leibniz says that, at the

level of bodies (that is, for Leibniz, at the level of well-founded phenomena), all occurs according to the laws of efficient causes; whereas with respect to perceptions and appetites (or at least with some of these—interpretations differ here) all occurs according to the laws of final causes. But there is no clash here, given the harmony of the kingdom of nature and the kingdom of grace in Leibniz's system, the harmony of final and efficient causes.

To be sure, at an ultimate level, the only actions of substances *are* changes of perceptions. Thus, at the ultimate level, the appetitions are not so much the tendencies impelling a person towards voluntary motions of the human body (although at the level of well-founded phenomena this may indeed be the case) but rather tendencies arising out of present perceptions (present appearances) towards new perceptions. This explains why Leibniz defines appetitions in the initially surprising way noted above, as “tendencies from one perception to *another*”—another *perception,* that is.

The last two paragraphs have helped to clarify appetition. It is time to return to perception. In Leibniz's definition (the expression of the many in the one) the two key terms are ‘expression’ and ‘one’. Both of them bear considerable weight in Leibniz's metaphysics. Representation or expression (Leibniz uses the two terms interchangeably) has its own definition: “One thing expresses another … when there is a constant and regulated relation between what can be said of the one and of the other” (letter to Arnauld, 9 October 1687). Examples, in addition to perception, include a map expressing or representing a geographical region and an algebraic equation representing or expressing a geometric figure, such as a circle or an ellipse.

With respect to oneness, Leibniz famously claims a connection with being. He says, “I hold this identical proposition, differentiated only by the emphasis, to be an axiom, namely, *that what is not truly* one *being is not truly one* being *either*” (letter to Arnauld, 30 April 1687). For Leibniz, what truly is is substance, so it is not surprising that at one point he clarifies his definition of perception by saying that perception is “the expression of many things in one, *or in simple substance*” (*A New Method of Learning and Teaching Jurisprudence*, revision notes of 1697-1700).

Finally, it should be recalled that for Leibniz there are quite distinct levels of perception among created substances. Some of these will be taken up in more detail in the following section, but the basic point for now is that the three major levels, from the lowest to the highest, are bare perception (without special distinctness or memory), sensation (with heightened distinctness and memory), and thought (with distinctness, memory, and reflection). These are distinctive of the three levels of monads, respectively, the bare monads, souls, and spirits. Only the last of these may properly be said to have reason. Only the last of these is strictly a mind in the Leibnizian classification.

5. Apperception, Desire and the Unconscious

One of the better-known terms of Leibniz's philosophy, and of his philosophy of mind, is apperception. A famous definition is presented in section 4 of the *Principles of Nature and of Grace* (1714), where Leibniz says that apperception is “*consciousness,* or the reflective knowledge of this internal state.” He

adds that this is “something not given to all souls, nor at all times to a given soul.”

Despite being well known, Leibniz's concept of apperception is not necessarily well understood. In particular, the place of apperception in the three-fold classifications given just above—of three kinds of perceptions and of simple substances—is not agreed upon, despite the fact that this would seem to be of considerable importance. A common understanding is that for Leibniz apperception is distinctive of spirits, and is not present in even the highest of animals beneath humans. While there is evidence that Leibniz at least sometimes adopts this position, there is also evidence that he sometimes endorses the view that (at least some) beasts also apperceive. Since we may assume that at a minimum apperception involves consciousness (though not necessarily certain higher forms of consciousness, e.g., self-consciousness, or reflective consciousness, in one sense or another), this leads to some uncertainty as to whether Leibniz assigns consciousness to beasts, that is, whether he does or does not agree with the famous Cartesian principle that beasts are not conscious, but only material automata.

There are at least three specific lines of evidence for apperception in beasts. The first is that Leibniz sometimes uses very similar definitions and examples when talking about the contrast between, on the one hand, apperceptions and *petites* perceptions (perceptions which are not apperceived), and, on the other, sensation and bare perceptions. This suggests, though it does not demonstrate, that Leibniz is identifying apperception and sensation, not apperception and rational thought. The second line of evidence is that he often appears to take the side of the common man against Descartes' position on beasts, for example, when he says,

> It will be difficult to rid mankind of this opinion which has been held always and everywhere and which is universal if any opinion deserves that term, namely, that beasts have feelings (letter to Arnauld, 9 October 1687).

Finally, there are passages, notably in the *New Essays concerning Human Understanding* (1704), in which Leibniz quite simply ascribes apperception, directly or indirectly, to beasts, as, for example, when he discusses the case of a wild boar that has only a bare perception of a human until the human shouts at it, at which point the boar apperceives the person (”*s'apperçoit d'une personne*“)and begins a charge (Bk.II ch.21, sec.5; A vi VI 173).

Without trying to proceed further with this issue here, we can see that whichever of these views is ultimately adopted, it remains the case that Leibniz's theory of perception involves something very distinctive in an age dominated by Descartes' theory of ideas, the thesis that there are some perceptions of which we are not conscious, the much-discussed *petites* perceptions. Although Leibniz was not the first to propose such an idea (Aquinas, for example, had a similar view), and although the view in his hands did not have the explosive quality that it did in the hands of Freud, the thesis remains an intriguing and important part of his philosophy of mind. Indeed, the Preface of the *New Essays concerning Human Understanding* contains as strong a statement as one is likely to find about the centrality of this view in a particular metaphysical system. Among other things, Leibniz makes it very clear that it is not just lower simple substances that have such unconscious perceptions but also human minds.

Having raised the issue of unconscious perceptions, we should consider also the question of unconscious appetitions. This is infrequently discussed, but the question should not be overlooked. Since appetitions are tendencies or strivings, ones which profoundly influence human actions, it is of distinct human relevance whether or not an individual human is conscious of all of these strivings. Certainly, some have taken the possibility of urges of which we are not conscious as highly important for the proper understanding of individual humans, and indeed of the human condition generally.

There is evidence, notably from the *New Essays*, that Leibniz did indeed draw a parallel between perceptions and appetitions with respect to consciousness. Although he did not always explain the distinction between conscious and unconscious appetitions with care and uniformity, it seems clear that he committed himself to appetitions of which we are not conscious, or which we do not apperceive, just as he had committed himself to perceptions which are not apperceived. Consider the following two statements in combination: “desires and tendencies which are apperceived are often called volitions” (*New Essays*, Bk.II, ch.21, sec.39); and, “There are also efforts that result from insensible perceptions which one does not apperceive, and these I prefer to call *appetitions* rather than volitions (although there are also apperceptible appetitions)” (*New Essays*, Bk.2, ch.21, sec.5).

In short, and perhaps oversimplifying to a certain extent, we can say that in the Leibnizian realm of mind there are indeed only perceptions and appetitions, but in these there is a fundamental divide between the realm of consciousness and unconsciousness. In the former, there are apperceptions and desires, the perceptions and appetitions of which we are conscious. In the latter, there are perceptions and appetitions of which we are not conscious. That does not mean, however, that this latter realm is unimportant in our mental lives. As Leibniz says, “insensible perceptions are as important to [the science of minds, souls, and soul-like substances] as insensible corpuscles are to natural science, and it is just as unreasonable to reject the one as the other on the pretext that they are beyond the reach of our senses.” ((*New Essays*, Preface) He would have said the same, no doubt, about inapperceptible appetitions.

Leibniz on the Problem of Evil

Without question, the problem of evil vexed Leibniz as much as any philosophical problem during his career. This is obvious from the fact that the first and the last book length works that he authored, the PhilosopherÕs Confession (written at age 26 in 1672) and the Theodicy (written in 1709, seven years before his death) were both devoted to this problem. It is, as well, equally striking that this latter work was the only book length treatise Leibniz saw fit to publish during his life. In this entry we will examine to two main species of the problem of evil which Leibniz addresses. The first, "the underachiver problem," is the one raised by the critic who argues that the evil in our world indicates that God cannot be as knowledgeable, powerful, or good, as traditional monotheists have claimed. The second, "the holiness problem," is one raised by a critic who argues that God's intimate causal entanglements with the world make God the cause of evil. God is thereby implicated in the evil at the expense of his holiness.

The Variety of Problems of Evil in Leibniz

Without question, the problem of evil vexed Leibniz as much as any philosophical problem during his career. This is obvious from the fact that the first and the last book length works that he authored, the *Philosopher's Confession* (written at age 26 in 1672) and the *Theodicy* (written in 1709, seven years before his death) were both devoted to this problem. It is, as well, equally striking that this latter work was the only book length treatise Leibniz saw fit to publish during his life.

Before we take a closer look at Leibniz's views on the problem of evil, we will need to do some stage-setting to help us understand just what sort of problem Leibniz thought evil presented. Open any contemporary introductory textbook and philosophy and it becomes clear that the problem of evil in contemporary philosophy is thought of as an argument for atheism. Since, the atheist contends, God and

evil are incompatible, and evil clearly exists, there is no God. Some, thinking that the claimed incompatibility in the above argument is too strong, argue that even if the existence of God and the existence of evil prove compatible, the existence (or duration, or amount, or distribution) of evil provides us with at least strong evidence that God does not exist.

Framed in this way, the "atheistic problem of evil" invites certain sorts of responses. In particular, it invites the theist to explain how a being that is all-knowing, all-powerful, and all-good can allow evil to exist. And thus, contemporary responses to the problem of evil focus largely on presenting "theodicies" that is, reasons why a perfect being does or might allow evils of the sort (or duration, or amount, or distribution) we find in our world.

When we turn back, however, to the works of those medieval philosophers who treat the problem of evil, the "atheistic problem" is not to be found. Since these figures believed that the arguments of natural theology demonstrated overwhelmingly the existence of God, the problem that evil presented was quite different. For them, the problem was how the existence of evil was compatible with divine moral purity or holiness. Since, they argued, God is the author of everything that exists, and evil is one of the things that exists, God is thereby the author of evil. And if someone is an "author of evil," they are thereby implicated in the evil and thus cannot be morally pure or holy. Thus, God cannot be morally pure nor holy. Let's call this problem of evil the "holiness problem."

Because traditional theists held that God is the "author" or cause of everything in the cosmos in at least three different respects, discussions of the holiness problem often branch off into three correspondingly different directions. First, God is regarded as the *creative cause* of everything in the cosmos. Everything which exists contingently is caused to come into being by the creative activity of God. Second, God is the *conserving cause* of everything that exists. This means that God not only brings into existence every contingent thing that exists, but that every contingent thing which remains in existence does so by God's continuously *maintaining* it in existence. Third, every action by a created substance requires direct divine activity as *concurrent cause*. Thus, every whack of the hammer, every hit of my fingertip on the keyboard, every tug of a magnet on a piece of iron requires not merely that a created substance act, but also that the creator act concurrently with the substance to bring about the particular effect. [For a classic exposition of these various modes of divine causal involvement see St. Thomas Aquinas, *Disputationes de Potentia Dei* , Q.3, a.7, resp.]

Of course, since this traditional picture had God so intimately connected with the workings of the cosmos, the holiness problem seemed all the more intractable. In light of these intimate connections the problem is not just that God created a world in which evil happens to occur, but that God seems to be causally (and thus morally) implicated in, for example, every particular act of murder, every earthquake, and every death caused by plague. As a result, responses to the holiness problem sought to explain not only how God could remain holy in light of having *created* a world such as ours, but also how he could remain holy in light of *conserving* it in existence and *cooperating* in all the events that occur in it.

Since Leibniz lived in between these two eras, eras in which evil was taken to present quite different

problems for the monotheistic philosopher, we are immediately led to wonder which sort of problem he sought to address. Without a doubt Leibniz expends a great deal of effort attempting to solve the holiness problem. But he also frequently takes up something much like the atheistic problem. It would be somewhat deceptive, however, to call it the atheistic problem at this stage in the history of ideas however, since, when raised in this way, evil was seen more an argument for an unorthodox form of theism, than an argument for atheism. Thus, for example, a group of thinkers collectively known as "Socinians" held, among other things, that the existence of evil was not incompatible with God's *existence*, but that it was incompatible with the existence of a God who is *all-knowing*. Thus, Socinians held that God must not be all-knowing, lacking at least knowledge of the future. [For Leibniz's view on the Socinians see Theodicy 364 (H343; G VI 318) et passim. More details on Socinianism can be found in Jolley, c.2, and Maclachlan.]

We might then characterize the problem raised by atheists in our own century and by Socinians, to cite just one example, in the seventeenth century, in more broad terms as what I will call the "underachiever problem." According to the underachiever problem, if there were the sort of being that traditional monotheism describes as God, the existence of this world would represent a vast underachievement on his part; thus there is no such being as this. Atheists take this conclusion to show that there is no God, Socinians take it to show that God is not the sort of being the traditionalist supposes.

Without a doubt, Leibniz is concerned about the underachiever problem, though it is the Socinian, and not the atheist, version of the problem that occupies his attention. The winds of atheism simply had not reached the gale force proportions that it would in succeeding centuries. As a result, this stronger conclusion was not yet taken as a serious, or at least the main, threat presented by evil.

It is important to distinguish these various problems of evil since we cannot understand Leibniz's treatment of evil in a given text until we know what problem it is that he is addressing. Having set the stage in this way, we can know turn to look at Leibniz's solutions to these problems of evil, beginning with the underachiever problem, then turning to the holiness problem.

The Underachiever Problem

The core of Leibniz's solution to the underachiever problem is quite straightforward. Leibniz argues that there is no underachieving involved in creating this world since this world is the best of all possible worlds. Many thinkers have supposed that commitment to the claim that this world is the best of all possible worlds follows straightforwardly from monotheism. Since God is all-powerful, all-knowing, and all-good, there is certainly nothing that can prevent God from creating the best world. And God's goodness further obliges God to create the best world. Thus, the actual world is the best world.

Leibniz's reasoning to his conclusion does not, however, follow this straightforward path since, among other things, it is not clearly cogent as it stands. A number of seventeenth century figures recognized that God would not be obliged to create the best if there were no best world. There might be no such best world if the series of possible worlds formed a continuum of increasingly good worlds ad infinitum. And

if there were no such best world, we cannot fault God for failing to create the best since to do so is as impossible as, say, naming the highest number. There is no such number of course, and likewise no such world. Thus, while God may obliged to create a world which has at least some measure of goodness, he could not be obliged, on this view, to create the best. Thus, God simply chose arbitrarily to bring about one among the range of morally acceptable worlds. [This line of argument was common among certain Jesuit scholastics of the period. For discussions of this see, for example, Ruiz de Montoya, *Commentaria ac Disputationes in primam partem Summae Thologicae S. Thomae. De voluntate Dei et propiis actibus eius* , Lyon 1630, disp. 9 and 10, and Diego Granado, Diego Granado, *Comentarii in primam partem Summae Theologicae S. Thomae* , Pont-a-Mousson, 1624, pp.420-433.]

Leibniz was aware of this argument which denied God's obligation to create the best, but he was firmly committed to rejecting it. The reason for this is that a central principle of Leibniz's system, the Principle of Sufficient Reason, forced him to reject it. According to this principle, any state of affairs must have a reason sufficient which explains why it and not some other state of affairs obtains. When it comes to our world, then, there must be some reason which explains why it, and not some other world, obtains. Clearly, however, there can be no such reason on the view that the goodness of worlds increases ad infinitum. Thus, Leibniz held, there must be no such infinite continuum.

One might be tempted to resist Leibniz's argument here by saying that even on the "infinite continuum of good worlds" view there is something which can play the role of sufficient reason for the fact that this world is actual, namely, *God's decree that this world be actual* . But this, as Leibniz notes, would just push the problem back one step further, since the Principle of Sufficient Reason applies to free choices as much as any other event. Thus, we would have to provide a sufficient reason for God choosing this world over some other on the continuum. And it looks like providing such a sufficient reason is the very thing we cannot do on the infinite continuum of good worlds view. Notice that the sufficient reason cannot be provided by some feature or fact about the world actually chosen. For this would raise the obvious question: why did *this* feature provide the sufficient reason for God's choice? The only possible answers, it appears, would be: a) because God arbitrarily selected that feature as the one he would favor in deciding which world to create, or b) because that feature made that world better than the competitors. But notice that neither of these answers are acceptable. The first is inconsistent with the Principle of Sufficient Reason. The second is incompatible with the hypothesis we are trying to defend here: that there is no "best world."

One might think that declaring this world to be the best possible world is hardly a response to the underachiever problem. In fact, one might think it just provides ammunition for a new underachiever argument along the following lines:

> 1) If God were all-powerful, all-knowing, and all-good, then this world would be the best possible world.
>
> 2) But surely this world is not the best possible world.

3) Thus, God is not all-powerful, all-knowing, and all-good.

Leibniz believed that the evidence that the conclusion of this argument was false was simply overwhelming. So, he is committed to thinking that one of the two premises in this argument is false. Since he himself is committed to the first, he ought to reject the second. And this is what he does.

What reason, Leibniz asks, does the critic have for thinking that 2) is true? When Leibniz addresses this issue, he usually has the critic saying something along the following lines:

> Surely this world is not the best possible world since we can easily conceive of possible worlds that are better. Take some token instance of suffering: the tragic bombing of the Oklahoma City federal building. Surely a world without that event would be better than the actual world. And there is no reason why God couldn't have created the world without that event. Thus, this is not the best possible world. [See Theodicy 118-119 (H 188-191; G VI 168-172)

Leibniz's response to this sort of criticism comes in two stages. First, Leibniz says that while we can think of certain token features of the world that might be better than they are taken individually, we don't know whether or not it is possible to create a better world without those features, since we are never sure of what the connections between the token events and other events in the world might be. If we could improve the token event without otherwise changing the world, we may well have a better world. Unfortunately, we have no way of knowing if changing the token would leave the world otherwise unchanged, or might instead make things, on balance, worse. [See Theodicy 211-214 (H260-2; G VI 244-7) and Grua, p.64f., for examples]

Second, examples such as these are deceptive because they presume that God utilizes standards of world goodness that he does not use. For example, it might presume that a world is only good if each part taken in isolation is good (a standard we have seen Leibniz argues against). Or, it might presume that a world is good only if earthly humans enjoy happiness.

Leibniz argued repeatedly that it was surely too parochial to think that the standard by which the goodness of worlds is to be judged is earthly human happiness. A more reasonable standard, says Leibniz, would be the happiness of all sentient beings. But once we admit this, it may turn out that the amount of unhappiness in the created realm is quite small since for all we know, the sentient beings on the earth might represent a very small percentage of the sentient beings God has created. Here he includes not only preternatural beings such as angels, but the possibility of extra-terrestrial rational beings as well [Theodicy 19 (H134-5; G VI 113-4)].

Leibniz scholars differ about which standard Leibniz thought was applicable in judging the goodness of worlds. Various scholars have defended one or more of the following:

1) The best world is the one which maximizes happiness (i.e., virtue) of rational beings.

> 2) The best world is the one which maximizes the "quantity of essence."
>
> 3) The best world is the one which yields the greatest variety of phenomena governed by the simplest set of laws.

Whether or not Leibniz believed that the maximizing the happiness or virtue of rational beings is one of the standards by which God judges world goodness is a disputed question. [For supporters of this claim see Rutherford, c.3; Blumenfeld, Brown; for detractors see Russell, p.199, Gale]. It is unlikely that Leibniz believed that 1) alone was the true standard of world goodness in light of the fact that he says, in commenting on an argument by Bayle:

> the author is still presupposing that false maxim . . . stating that the happiness of rational creatures is the sole aim of God [Theodicy 120 (H192; G VI 172)]

In part, the dispute over this standard hangs on whether or not 1) is compatible with the more metaphysical standards embodied in 2) and 3), since it is these more metaphysical standards that Leibniz seems to endorse most consistently. In some cases, Leibniz writes as if the standard of happiness is fully compatible with the more metaphysical criteria For example, within a single work, the *Discourse on Metaphysics* , Leibniz entitled section 5 "What the rules of the perfection of divine conduct consist in, and that the simplicity of the ways is in balance with the richness of effects," and entitled section 36: "God is the monarch of the most perfect republic, composed of all minds, and the happiness of this city of God is his principle purpose." Here Leibniz seems to advance both standards 1) and 3) in the same work [For another example, see Riley, p.105 (K X pp.9-10)]. In other places however, he writes as if they compete with one another [See Theodicy 124 (H197-8;G VI 178-9)].

Whatever position one comes to hold on this matter, Leibniz often points to the more metaphysical standards as the ones God utilizes in assessing world goodness. But there is further controversy over exactly which metaphysical standard, 2) or 3), Leibniz endorses. In general, Leibniz holds that God creates the world in order to share his goodness with created things in the most perfect manner possible [Grua 355-6]. Since limited created things can only mirror the divine goodness in limited respects, God creates a variety of things, each of which has an essence that reflects different facets of divine perfection in unique ways. Since this is God's goal in creating, it would be reasonable to think that maximizing the mirroring of divine goodness in creation is the goal that God seeks in creating. And this in fact is one of the standards Leibniz seems to endorse. We might call this the "maximization of essence" standard. Leibniz seemed convinced that the actual world met this standard and that we could therefore find creatures which mirrored the divine perfections in all the sorts of ways that creatures could do this. Thus, there are creatures with bodies and creatures without, creatures with freedom and intelligence and creatures without, creatures with sentience and creatures without, etc. [See, for example, MP pp.75-6 and 138 (G VII 303-4 and 310)].

In some texts, however, Leibniz frames the standard of goodness in what some have taken to be a third distinct way. In these places he argues that the goodness of a world is measured by the ratio of the variety

of phenomena a world contains to the simplicity of the laws which govern it. Here Leibniz emphasizes the fact that the perfection of a world which maximizes the variety of phenomena it contains is enhanced by the simplicity of its laws since this displays the intelligence of the creator who created it.

Various scholars have made the case that one or the other of these two more metaphysical standards represents Leibniz's settled view on the true standard of goodness [Gale, for example]. Others have argued that, in the end, the two standards are not exclusive of one another [See Rutherford, cc.2-3 and Rescher, c.1 for two very different ways of harmonizing 2) and 3)].

Whichever might be the case, if these are the standards by which one thinks God judges the world's goodness, it becomes much more difficult to defend the claim that this is not the best possible world. We can use standard 3) to illustrate. If God were to eliminate the Oklahoma City bombing, what would be required to do so? There are presumably a number of ways in which this might be done. The most obvious would involve miraculous intervention somewhere in the chain of events leading up to the explosion. God might miraculously prevent the explosives from detonating, or might make the entire truck and its contents vanish. But any sort of miraculous intervention will involve making the laws governing the phenomena more complex. As a result, Leibniz, and others who share this view of what world goodness consists in, such as Malebranche, think that miraculous intervention is generally repugnant and would require vastly outweighing goods in order for them to be permissible. [See Theodicy 129 (H192-3; G VI 182)].

In any case, Leibniz holds that we are simply unable to know how changing certain events would change the worlds capacity to meet the standards of goodness described in 2) and 3). As a result, we can never, with any confidence, make the claim that this world is not as good, all things considered, as some other world we might try to imagine. According to Leibniz, then, the underachiever problem cannot get off the ground unless the critic is able to defend the claim that this world is not the best possible world. While we might think such a defense would be easy to mount, our inability to know how changing certain events in the world would affect other events, and our inability to know how such changes would affect the true overall goodness of the world makes such a defense impossible for us.

The Holiness Problem

Far less scholarly attention has been devoted to Leibniz's treatment of the holiness problem, if only because this way of seeing the problem has only recently been recognized by Leibniz scholars. As mentioned above, the main problem here is that God's character seems to be stained by evil since God knowingly and causally contributes to the existence of everything in the world, and evil is one of those things. [For two recent treatments see Sleigh (1997) and Murray (1998)]
The standard solution adopted by medieval thinkers was to deny something the above argument affirms, namely, that evil is a "something." Evil, they claimed was not a positive reality, but a "privation" or "lack." As a result, evil has no more reality than the hole in the center of a donut. Making a donut does not require putting together two components, the cake and the hole. Instead, the cake is all that there is to the donut. The hole is just "privation of cake." Thus, it would be silly to say that making the donut

requires something to cause the cake, and then something to cause the hole. Causing the cake causes the hole as a "by-product." Thus, we need not assume any additional cause for the hole beyond that assumed for the causing of the cake.

The upshot of our pastry analogy is simply this: since evil, like the hole, is merely a privation, it needs no cause on its own (or as the medievals, and Leibniz, liked to say, it needs no "cause *per se* "). Thus, God is not a "knowing causal contributor to evil" since evil *per se* has no cause at all. But since God does not contribute to evil, God cannot be implicated in the evil. Thus, the holiness problem evaporates.

Early in his career Leibniz, like many seventeenth century figures, scoffed at this solution. In a short piece entitled "The Author of Sin," Leibniz explains why he thinks the privation response to the holiness problem fails. Since, Leibniz argues, God is the author of all that is real and positive in the world, God is, by extension, "author" of all of its privations, "It is a manifest illusion to hold that God is not the author of sin because there is no such thing as an author of a privation, even though he can be called the author of everything which is real and positive in the sinful act." [A.6.3.150]

The reason, says Leibniz, can be gleaned from an example. Consider a painter who creates two paintings, one a small scale version of the other. The details of the pictures are identical in every respect, only the scale is different. It would be absurd, Leibniz remarks,

> . . . to say that the painter is the author of all that is real in the two paintings, without however being the author of what is lacking or the disproportion between the larger and the smaller painting. . . . In effect, what is lacking is nothing more than a simple result of an infallible consequence of that which is positive, without any need for a distinct author [of that which is lacking] [A.6.3.151]

Thus, even if it is true that evil is a privation, this does not have as a consequence that God is not the author of sin. Since what is positively willed by God is a sufficient condition for the evil state of affairs obtaining, willing what is positive makes God the author of that which is privative as well [A similar early critique is found at A.6.3.544].

Thus, in his early years Leibniz looks to develop a different strategy. In the *Philosopher's Confession* , his most significant treatise on evil aside for the *Theodicy* , Leibniz claims that God wills everything in the world, though his will with respect to goods in the world is *decretory* , while his will respect to evils is merely *permissive* . Further, Leibniz argues, permissive willing of evils is morally permissible as long as the permitting the evil is a necessary condition for meeting one's outweighing obligations.

It is important to note here that Leibniz does not think that the permission of evil is morally permissible because allowing the evil *brings about a greater good not otherwise attainable* . To put the matter this way leaves God, according to Leibniz, in the position of violating the Biblical injunction "not to do evil that good may come" [Causa Dei 36 (S 121; G VI 444)]. Thus, Leibniz casts permission in such a way that the resultant evil is a *necessary consequence of God's performing his duty* (namely, to create the best

world). As a result, Leibniz characterizes (morally permissible) permission as follows:

> P permits E iff:
>
> 1. P fails to will that E
> 2. P fails to will that not-E
> 3. P brings it about that state of affairs S obtains by willing that S obtains
> 4. If S obtains then E obtains
> 5. P knows that 4)
> 6. P believes that it is P's duty to will S and that the good of performing one's duty outweighs the evil entailed by E's obtaining
>
> [This account is distilled from A.6.3.129-131]

This, Leibniz believes, resolves any holiness problem that might arise in so far as God is considered as creator of the cosmos. However, from the time that Leibniz composed the *Philosopher's Confession* until at least the mid-1680's, Leibniz grew increasingly concerned that a tension might arise in his account when applied to the holiness problem considered as a problem for *concurrence* . Recall that traditional theists held that God was not only creator and conserver of all created things, but that in addition God acted as concurrent cause of every act of a created substance.

There were heated debates in the sixteenth and seventeenth centuries concerning the nature of divine concurrence. And much of the dispute focused on the way in which God concurred with the free acts of creatures. This was an especially pressing problem for the obvious reason that positing too close of a connection between God and the creature in cases where moral evils are committed runs the risk of implicating God in the evil, thus raising the holiness problem all over again. This debate often focused on a certain type of proposition and on what made this type of proposition true. The type of proposition in question are called "conditional future contingents" and they are propositions of the form:

> If agent, S, were in circumstances, C, and time, t, S would freely chose to f.

These propositions were particularly important in discussions of philosophical theology in the sixteenth and seventeenth centuries because God's having knowledge of token propositions of this type was regarded as essential for God exercising providential control over the activities of free beings in creation. In order to be able to providentially superintend the activities of free beings in the created world, God must know how each such being will choose to act in each circumstance in which they will be found. If God did not know what Eve would choose when confronted by the serpent, or what I would choose when confronted with the tuna sandwich, God could not know, in advance, how the order of events would unfold in the universe he deigns to create.

But *how* does God know whether or not a token proposition of this type is true? Speaking generally, disputants in this period held that there were only two answers. God either knows that a token

proposition of this type is true because God wills it to be true, or because something independent of God's will makes it true, and God, being omniscient, thereby knows it. In keeping with recent tradition, we will call the first view the "postvolitional view" (since the truth of the proposition is determined only "after" God wills it) and the latter view the "prevolitional" view (since the propositions has truth independently of what God wills). In his early years, Leibniz seemed inclined to adopt the postvolitional answer. So, take the token proposition:

> If Peter were accused of consorting with Christ immediately after the crucifixion, Peter would deny Christ.

The early Leibniz would have held that this proposition, and others of this type, is true because God decrees that it is, that is, he decrees that Peter will deny under these circumstances [See C 26-7 and Grua 312-3]. Furthermore, those who held this view generally held that it was through divine concurrence that God makes the proposition true in the actual world. So, by causally influencing Peter at the moment of decision, God brings it about that Peter denies in these circumstances.

This view obviously faces a number of difficulties. For our purposes, the most pressing one is that it seems to undercut Leibniz's solution to the holiness problem based on permission. For if the above proposition is true because God wills that it is, then it appears that God wills that Peter sin, and if he wills that Peter sin, he cannot merely permit it, in light of condition 1) of the definition of permission. As a result, it appears that Leibniz must surrender his initial answer to the question "what makes conditional future contingents true?" and adopt the alternative answer.

There are troubles here as well, however. What does it mean to say that the truth of the proposition is determined independently of God's will? Defenders of this view usually held that the human will was entirely free from any determining cause whatsoever. In choosing one alternative over another, nothing could be regarded as "determining" or "causing" the choice, else it would not be free. Thus, for those who defended this view, the answer to the question "what makes conditional future contingents true?" must be "nothing." For if something *made* it true, then *that thing* would be determining the choice, and the choice could then not be free.

In light of his commitment to the Principle of Sufficient Reason, however, Leibniz could not support such a view. Does Leibniz, then, have answer to this question that will rescue him from the holiness problem? Scholars disagree about this. Some have held that Leibniz is obliged to hold the postvolitional view in spite of the troubles it raises for him [See Davidson, Sleigh (1995)(1997)]. Others have held that Leibniz tried to forge a third alternative in order to avoid this seemingly intractable dilemma [See Murray (1998)]. I will close with a look at this latter suggestion.

According to Leibniz, free choice in humans is brought about through the activity of the human intellect and the human will working in concert with one another. The intellect deliberates about alternatives and selects the one that it perceives to be the best all things considered. The intellect then represents this alternative to the will as the one that is best to pursue. The will, which for Leibniz is a faculty

characterized by "appetite for the good," then chooses that alternative which is represented to it as containing the most good. [*Theodicy* , 311 (H314; G VI 300-1).]

On this picture, it appears that there are two ways in which I might exercise "control" over my acts of will. First, I might be able to control what appears to me to be the best all things considered. That is, I might control the process of deliberation. Second, I might be able to control the will's choosing that alternative which is presented to it by the intellect as representing the greatest good at that time. There are places where Leibniz seems to accept each of these possibilities. In some passages he argues that by engaging in moral therapy of certain sorts I can control which things appear to me good, and thus control the outcome of my deliberations. In other passages, he seems to say that while the will does "infallibly" choose that which the intellect deems to be best, the will retains the power to resist since the intellect does not "cause" the will to choose as it does. [Concerning the first strategy see, for example, *Reflections on Hobbes* , 5 (H396-7; G VI 391-1). For more on this aspect of Leibniz's view of freedom see Seidler (1985). Concerning the second strategy see, for example *Theodicy* 282 (H298-300; G VI 284-5).]

Difficulties arise in following through on either suggestion. Consider the first. How might I go about engaging in "moral therapy"? First, I would have to choose to do something to begin to bring about a change in how I see things. But of course, I can only make a choice to do this if I first deliberate about it and see that making this change is the best thing to be done. So, did I have control over this process of "coming to see that a change is the best thing to be done"? It looks as if I have control here only if I have control over the actions that led to my coming to see things this way in the first place. Do I have control over these actions? If the answer is yes, it is only because I had control over my prior deliberations, and it looks as if this will lead us back in the chain of explanation to certain very early formative stages of my moral and intellectual life, stages over which it is hard to believe I had any control. Thus, this route seems hard to sustain.

Let us consider the second alternative then, according to which I have control because the will is never "causally determined" to choose that which the intellect deems to be best in those circumstances. Leibniz held that the will was not causally determined in the act of choice but merely "morally necessitated." Scholars disagree about exactly how we should understand this phrase. Some think it just means "causally necessitated." But if this is right, it appears that God, who establishes the laws of nature, determines how creatures act, and this leads us back to the suggestion that Leibniz was a postvolitionalist in these matters. As we noted above, this is a troubling position for Leibniz to adopt since it seems to undermine his response to the holiness problem. [For various positions on the nature of "moral necessity" see Adams, pp.21-2, Sleigh (1998), Murray (1995), pp.95-102, and (1996), esp. Section IV].

Others have held that moral necessity is a philosophical novelty, invented to explain the unique relationship between intellect and will. On this view, the will infallibly follows the outcome of deliberation, without being causally necessitated by it. Leibniz sometimes hints at this reading such as in the following example he borrows from Pierre Nicole:

> It is considered impossible that a wise and serious magistrate, who has not taken leave of

> his senses, should publicly commit some outrageous action, as it would be, for instance, to run about the streets in order to make people laugh [*Theodicy* 282 (H299; G VI 284)]

Here, the wise magistrate is not causally determined to refrain from streaking to make people laugh. Instead, he just considers it so unseemly that "he can't bring himself to do it." Something about his psychological constitution prevents him from seeing this as a live option for him, even though there is surely some sense in which he *could do it* nonetheless.

If we allow Leibniz to locate control over actions in the fact that the will is only morally necessitated by the intellect, is there a way for him to avoid the postvolitional/ prevolitional dilemma discussed earlier? It is not clear. One would have to say that the will infallibly choosing in accordance with the deliverances of deliberation is a fact, the truth of which is *independent of God's will* , while also saying that the deliverances of deliberation provide a *sufficient reason* for the wills choice. If this can be done, Leibniz may have a way of avoiding the difficulty posed by conditional future contingents.

However we might think these questions should be resolved, Leibniz himself seemed to think that the prevolitional route is the one to take. This seems relatively clear in light of the fact that from the mid-1680's onward, Leibniz consistently uses language which implies that God merely "discovers" how free human beings would act if created. [See, for example, Grua 227, 232, A&G 32, and C 23-4]. It is not something that God makes so. In these later works, Leibniz speaks of these truths about how human beings will act as "limitations" which prevent God from making them, and the world that contains them, more perfect. In the end, it is these limitations, Leibniz argues, which prevents there being a better world than the actual one [On the notion of "limitations" see A&G 60-2, 11,*Theodicy* 20 (H86-7; G VI 114-5), *Causa Dei* 69-71 (S 128-30; 457-8)]. If this is right, then we might think that the permission strategy will work as a solution to the holiness problem both when it comes to considering God as creator and as concurrent cause of all effects in the cosmos.

It is interesting to note that, for reasons still not clear, Leibniz comes to favor, in later life, the scholastic "privation" view he rejected in his youth. [See, for example, *Theodicy* 20, 30, 153 (respectively, H86-7, 91-2, 219-20; G VI 114-5, 119-20, 201]. The role that this revived position is supposed to play for Leibniz in his later writings awaits further scholarly investigation.

The issues that arise in thinking about Leibniz's views on the problem of evil are vigorously discussed among contemporary Leibniz scholars and philosophers of religion. It is clear that his thinking about evil impacts, and is impacted by, some of the most centrally important components of his philosophical and theological system. Because of this, scholars have found inquiry into this feature of Leibniz's philosophy a particularly rewarding route for discovering some of the deeper motivations standing behind some of Leibniz's more puzzling philosophical views. Yet because this topic represents such an active area of current Leibniz scholarship, it is clear that any conclusions we might draw on his views are, for now, preliminary and subject to revision.

Naturalism in Legal Philosophy

The “naturalistic turn” that has swept so many areas of philosophy over the past three decades has also had an impact, especially recently, in legal philosophy. Methodological naturalists (M-naturalists) view philosophy as continuous with empirical inquiry in the sciences. Some M-naturalists want to *replace* conceptual and justificatory theories with empirical and descriptive theories; they take their inspiration from more-or-less Quinean arguments against conceptual analysis and foundationalist programs. Other M-naturalists retain the *normative* and regulative ambitions of traditional philosophy, but emphasize that it is an *empirical* question what normative advice is actually useable and effective for creatures like us. Some M-naturalists are also *substantive* naturalists (S-naturalists). Ontological S-naturalism is the view that there exist only *natural* or *physical* things; semantic S-naturalism is the view that a suitable philosophical analysis of any concept must show it to be amenable to empirical inquiry. Each of these varities of naturalism has applications in legal philosophy. *Replacement* forms of M-naturalism hold that: (1) conceptual analysis of the concept of law should be replaced by reliance on the best social scientific explanations of legal phenomena, and (2) normative theories of adjudication should be replaced by empirical theories. These views are associated with American Legal Realism and Brian Leiter's reinterpretation of Realism. Normative M-naturalists, by contrast, inspired and led by Alvin Goldman, seek to bring empirical results to bear on philosophical and foundational questions about adjudication, the legal rules of evidence and discovery, the adversarial process, and so forth. An older form of S-naturalism in legal philosophy, associated with Scandinavian Legal Realism, seeks a reduction of legal concepts to behavioral and psychological categories. More recent forms of S-naturalism, associated with a revival of a kind of natural law theory defended by David Brink and Michael Moore (among others), applies the “new” or “causal” theory of reference to questions of legal interpretation, including the interpretation of moral concepts as they figure in legal rules.

---

1. Varieties of Naturalism: Methodological and Substantive

Different philosophical doctrines travel under the heading of “naturalism.” We can usefully distinguish two broad and important categories: *methodological* (or M-naturalism) and *substantive* (or S-naturalism) (Leiter 1998; cf. Railton 1990 and Goldman 1994). Naturalism in philosophy is most often a *methodological* view to the effect that philosophical theorizing should be continuous with empirical inquiry in the sciences. Such a view need not presuppose a solution to the so-called “demarcation problem”—i.e., the problem of what demarcates genuine science from pseudo-science—as long as there remain clear, paradigmatic cases of successful sciences. Some M-naturalists want “continuity with” only the *hard* or *physical* sciences (Hard M-naturalists); others seek “continuity with” any successful science, natural or social (Soft M-naturalists). Soft M-naturalism is probably the dominant strand in philosophy today.

For M-naturalists, “continuity with” the sciences includes, in the first instance, the Quinean repudiation of a “first philosophy”, a philosophical solution to problems that proceeds entirely *a priori*, that is, without the benefit of empirical evidence. (Most M-naturalists do not go as far as Quine, however, in repudiating *any* role for *a priori* conceptual analysis: see, e.g., Goldman 1986 for a more typical M-naturalist approach). Beyond hostility to methods that are exclusively *a priori*, M-naturalists require continuity with the sciences in two more precise senses, what we may call “Results Continuity” and “Methods Continuity”.

Results Continuity requires that the substantive claims of philosophical theories be supported or justified by the results of the sciences. Epistemologists like Goldman look to the results of psychology and cognitive science to find out how the human cognitive apparatus really works; only with that information in hand can the epistemologist construct norms for how humans *ought* to form beliefs (Goldman 1978, 1986). Moral philosophers like Gibbard and Railton, despite profound substantive disagreements, both think that a satisfactory account of morality's nature and function must be supported by the results of evolutionary biology, our best going theory for how we got to be the way we are (Gibbard 1990, Railton 1986). A philosophical account of morality that explains its nature and function in ways that would be impossible according to evolutionary theory would not, by naturalistic scruples, be an acceptable philosophical theory.

“Methods Continuity,” by contrast, demands only that philosophical theories emulate the “methods” of inquiry of successful sciences. “Methods” should be construed broadly here to encompass not only, say, the experimental method, but also the styles of explanation (e.g., via appeal to causes that determine, *ceteris paribus*, their effects) employed in the sciences. Such a view does not presuppose the methodological *unity* of the various sciences, only that successful sciences have some methodological *uniqueness*, even if this is not exactly the same across all the sciences. Historically, Methods Continuity has constituted the most important type of naturalism in philosophy, found in writers like Spinoza, Hume, and Nietzsche. (However, unlike the contemporary M-naturalists who draw on the actual *results*

of established sciences, many historical M-naturalists drawn to Methods Continuity simply try to *emulate* a scientific way of understanding the world in developing their philosophical theories.)

M-naturalists, then, construct philosophical theories that are continuous with the sciences either in virtue of their dependence upon the actual results of scientific method in different domains or in virtue of their employment and emulation of distinctively scientific ways of looking at and explaining things. We may still distinguish between two different branches of M-naturalism, represented best by Quine, on the hand, and Goldman, on the other. The former we will call Replacement Naturalism, the latter Normative Naturalism. Goldman's paradigm of Normative Naturalism has dominated philosophical research in the area (see Kitcher 1992), though it is Quine's notion of Replacement Naturalism that proves useful for understanding the American Legal Realists as naturalists in legal philosophy (Leiter 1997). Since both Replacement and Normative Naturalists share the *methodological* commitment distinctive of naturalism—to make philosophical theorizing continuous with and dependent upon scientific theorizing—the difference must be located elsewhere: not in methodology, but in goal. According to Replacement Naturalists, the goal of theorizing is description or explanation; to that end, conceptual and justificatory theories are to be *replaced* by empirical and descriptive theories. According to Normative Naturalists, the goal is regulation of practice through the promulgation of norms or standards. Of course, traditional epistemology also shares the regulative goal of Normative Naturalism; what distinguishes the Normative Naturalist is simply the *methods* employed to realize this objective (cf. Goldman 1986, pp. 6-9).

Many naturalists go beyond methodological naturalism, however, and embrace a *substantive* doctrine. S-naturalism in philosophy is either the (ontological) view that the only things that exist are *natural* or *physical* things; or the (semantic) view that a suitable philosophical analysis of any concept must show it to be amenable to empirical inquiry. In the ontological sense, S-naturalism is often taken to entail physicalism, the doctrine that only those properties picked out by the laws of the physical sciences are real. In the semantic sense, S-naturalism is just the view that predicates must be analyzable in terms that admit of empirical inquiry: so, e.g., a semantic S-naturalist might claim that “morally good” can be analyzed in terms of characteristics like “maximizing human well-being” that admit of empirical inquiry by psychology and physiology (assuming that well-being is a complex psycho-physical state).

Many philosophers are drawn to some type of S-naturalism in virtue of their M-naturalism: being a philosophical naturalist in the methodological sense sometimes leads a philosopher to think that the best philosophical account of some concept or domain will be in terms that are substantively naturalistic. (So, e.g., while both Gibbard (1990) and Railton (1986) are M-naturalists—in the sense that both seek to locate morality in a world-view circumscribed by the results of evolutionary biology—only Railton is an S-naturalist since only he thinks that the account of morality that makes it square best with the results of evolutionary biology is one which interprets moral properties as being reducible to “natural” properties amenable to inquiry in the sciences.) It is important to notice that a commitment to Methodological Naturalism does *not* entail any substantive conclusions, however: methodologically, it is an open question whether the best philosophical account of morality or mentality or law must be in substantively naturalistic terms.

The varieties of philosophical naturalism map on to a variety of naturalistic approaches in legal philosophy. The most radical version of M-naturalism, Replacement Naturalism, is articulated and defended in Leiter (2001b, 2001c) and, arguably, in the American Legal Realists (Llewellyn 1930; Moore and Callahan 1943; Leiter 1997). The less radical form of M-naturalism, Normative Naturalism, is exemplified in epistemology by Goldman (1978, 1986), as noted, but its implications for jurisprudence and law have, to date, only been partly developed (Allen & Leiter 2001; Goldman 1999; Leiter 1998, 2001d; Talbott & Goldman 1998). One form of S-naturalism is well-represented by Scandinavian Realism of mid-century (Hägerström 1953, Ross 1958), although their S-naturalism, conjoined as it is with skepticism about normative concepts, ends up requiring an implausible semantics of legal concepts. More recently, S-naturalism without normative skepticism has been defended by contemporary moral realists and natural law theorists like Brink (1988, 1989, 2001) and Moore (1985, 1992b).

2. Replacement Naturalism I: Against Conceptual Analysis

Replacement Naturalism holds that conceptual and justificatory theories—the traditional fare of philosophy—are to be *replaced* by empirical and descriptive theories. There are two kinds of argumentative routes to Replacement Naturalism, both due to Quine: the first arises from doubts about the analytic-synthetic distinction (Quine 1951); the second from doubts about foundationalism (Quine 1969). Here we consider the former.

Philosophers have long thought that some truths were *necessary* while others were *contingent*; in the twentieth-century, under the influence of logical positivism, this was taken to be the distinction between those statements that were “true in virtue of meaning” (hence *necessarily* true) and those that were “true in virtue of fact” (hence only *contingently* true). The former “analytic” truths were the proper domain of philosophy; the latter “synthetic” truths the proper domain of empirical science. Quine argued that the distinction could not be sustained: all statements are, in principle, answerable to experience, and, conversely, all statements can be maintained in the face of experience as long as we adjust other parts of our picture of the world. So there is no real distinction between claims that are “true in virtue of meaning” and “true in virtue of facts,” or between ‘necessary’ and ‘contingent’ truths; there is simply the socio-historical fact that, at any given point in the history of inquiry, there are some statements we are unlikely to give up in the face of recalcitrant empirical evidence, and others that we are quite willing to give up when empirical evidence conflicts.

Without a domain of analytic truths—truths that are *a priori* and hold in virtue of meaning—it becomes unclear what special domain of expertise for philosophical reflection remains. If all claims are, in principle, revisable in light of empirical evidence, why not let all questions fall to empirical science? Philosophy would be out of business, except perhaps as the abstract, reflective branch of empirical science. This Quinean attack has consequences for the traditional philosophical business of conceptual analysis, since on the dominant view from Plato through Carnap “every analysis of a concept is inextricably bound to a collection of purported analyticities” (Laurence & Margolis 1999, p. 18). (Even

the more recent “posession-condition” account of concepts in Peacocke (1992) requires that it be *analytic* that certain inferential transitions are privileged by a particular concept.) The conclusion Replacement Naturalists draw from the preceding is that since any claim of conceptual analysis is vulnerable to the demands of *a posteriori* (i.e., empirical) theory construction, philosophy must proceed in tandem with empirical science, not as the arbiter of its claims, but as a reflective attempt at synoptic clarity about the state of empirical knowledge.

Many resist this conclusion. According to one proponent, a conceptual analysis proceeds “by appeal to what seems to us most obvious and central about [the concept in question]…as revealed by our intuitions about possible cases” (Jackson 1998, p. 31). “[T]he general coincidence in intuitive responses [to possible cases] reveals something about the folk theory of [the concept in question]” (Jackson, 1998, p. 32). The question that plagues conceptual analysis, post-Quine, is what kind of *knowledge* such a procedure actually yields? Why should ordinary intuitions about the extension of a concept be deemed reliable or informative? Why think the “folk” are right?

The track record of *a priori* methods like appeal to intuitions and conceptual analysis is not a promising one (e.g., Harman 1994; Hintikka 1999). Kant, for example, took it to be *a priori* that space necessarily had the structure described by Euclidean geometry; subsequent physics showed his intuitions to be mistaken. The moral naturalists would draw from this track record of *a priori* philosophy is well-expressed by Cummins (1999, pp. 117-18):

> We can give up on intuitions about the nature of space and time and ask instead what sort of beasts space and time must be if current physical theory is to be true and explanatory. We can give up on intuitions about representational content and ask instead what representation must be if current cognitive theory is to be true and explanatory.

For the Replacement Naturalist, in short, the only sound reason to prefer a proposed conceptual analysis is not because it seems intuitively obvious, but because it earns its place by figuring in successful *a posteriori* theories of the world. Philosophy *cum* conceptual analysis and intuition-pumping should be abandoned in favor of empirical science; philosophy is simply the more abstract and reflective part of empirical science and lays claim to no distinctive methods or body of knowledge.

Defenders of conceptual analysis, it is true, commonly proclaim the modesty of their ambitions; indeed, Jackson specifically chastises conceptual analysis in its “immodest role,” namely when “it gives intuitions…too big a place in determining what the world is like” (1998, pp. 43-44): “There is nothing sacrosanct about folk theory. It has served us well but not so well that it would be irrational to make changes to it in the light of reflection on exactly what it involves, and in the light of one or another empirical discovery about us and our world” (Jackson 1998, p. 44). The question is, having conceded this much, what remains? Conceptual analysis, as Jackson conceives it, becomes hard to distinguish from banal descriptive sociology of the Gallup-poll variety. (Jackson even says he advocates, when necessary, “doing serious opinion polls on people's responses to various cases” (1998, p. 36).) Such a procedure might deliver some insight in to what some people, at some time, in some place, think about “mind” or

"law" or "justice," but Replacement Naturalists wonder what philosophical import any of this data could have, since it is bounded not simply by time and place, but also ignorance.

How might Replacement Naturalism in legal philosophy, motivated by these Quinean doubts about conceptual analysis and intuitions, proceed? One possibility is suggested in Leiter (2001b, 2001c), which invokes the following example. Raz (1985) has offered an influential conceptual argument against Soft Positivism's claim that there is no constraint on the content of a rule of recognition beyond the fact that it is a social rule: its existence-conditions are given by the actual practice of officials in deciding disputes, but what criteria of legality officials appeal to (i.e., the *content* of the rule of recognition) is dependent upon whatever the conventional practice of officials in that society happens to be. Raz offers an analysis of the concept of authority to show that Soft Positivism is incompatible, even in principle, with the law's possessing the authority it claims to possess. According to Raz, it is a non-normative prerequisite for a claim to authority that it be possible to identify the authority's directive without reference to the underlying "dependent" reasons for that directive. This is a *prerequisite* for authority because what distinguishes a (practical) authority, on Raz's "service" conception, is that its directives preempt consideration of the underlying reasons for what we ought to do, and in so doing actually makes it more likely that we will do what we really ought to do. Authoritative reasons are claimed to be exclusionary reasons, excluding from consideration those dependent reasons (including, importantly, moral reasons) on which the authoritative directive rests. Soft Positivism, then, undermines the possibility of the rule of recognition claiming authority, since for Soft Positivism a rule of recognition can, in principle, employ dependent reasons as criteria of legal validity: to identify, then, the directives about legal validity of such a rule of recognition would be impossible without recourse to precisely the dependent reasons the rule was supposed to preempt.

One line of response to Raz has appealed to contrary intuitions about the concept of authority. Perry (1987), for example, argues that authoritative reasons need not be exclusionary in Raz's sense; it suffices, Perry says, that they simply be "weightier" than other reasons. Some commentator's intuitions line up with Raz's (Leiter 2001b), others with Perry (Waluchow 1994). Now, of course, the Quinean worries about conceptual analysis hold even in cases where everyone's intuitions about a concept coincide; but when they do not coincide, the inadequacies of the philosophical "methods" at hand seem especially acute. Some proponents of traditional methods of legal philosophy object that "the mere fact that there is disagreement about what the conceptual truths of law are…does not mean that conceptual analysis of law is fruitless. If that were the case, we should have to conclude the same about philosophy generally" (Coleman 2001, p. 211 n. 38). Unfortunately, this *reductio* response depends on a conclusion that the Replacement Naturalist is, in fact, prepared to embrace—and not because the Replacement Naturalist naively believes empirical methods "would…put an end to disputes about the nature of law or anything else" (Coleman 2001, p. 211 n.38). The worry, rather, is that intuitions about concepts enjoy no privileged epistemic status, while claims in empirical science do. Even if empirical science does not resolve these disputes, it at least delineates criteria with epistemic weight for adjudicating them. The crucial question, then, becomes whether our best empirical science requires drawing the conceptual lines one way rather than another.

The leading social scientific accounts of judicial decision-making—both the informal ones (Pritchett

1949, Powe 2000) and the formal ones (Segal & Spaeth 1993)—have two striking features in this regard: first, they all aim to account for the relative causal contribution of “law” and non-law factors (e.g., political ideologies or “attitudes”) to judicial decisions; and second, they demarcate “law” from non-law factors in typical Hard Positivist terms, i.e., they generally treat as “law” only pedigreed norms, like legislative enactments and prior holdings of courts (as well, sometimes, as the interpretive methods applied to these kinds of legal sources: see the treatment of the “legal model” in Segal & Spaeth 1993, pp. 33-53). Supposing that these models are ultimately vindicated empirically—and not just for American courts—this would give the Replacement Naturalist reason to abandon any *a priori*, intuitive confidence we had about the concept of law that conflicted with Hard Positivism—just as the role of non-Euclidean geometry in parts of physics has led *everyone* to repudiate Kant's *a priori* intuitive confidence about the Euclidean structure of space. If social science cuts the causal joints of the legal world in Hard Positivist terms, the Replacement Naturalist argues, that is a compelling reason to work with that concept of law as against its competitors.

Proponents of conceptual analysis, by contrast, are skeptical that the explanatory premises of empirical social scientists give us any reason to prefer one concept of law to another. Notice, of course, that an analogous skepticism is available to the diehard Euclidean: after all, non-Euclidean geometries are famously non-intuitive and hard to grasp. But Kantians recognize that such a response would be unmotivated: if non-Euclidean geometry does explanatory work within successful physical theory, then the right conclusion to draw is that our intuitions about the structure of space need tutoring to keep pace with empirical knowledge. So, too, the analogous question for the natural lawyer or Soft Positivist is: why think your intuitions are epistemically privileged as opposed to simply untutored by the best empirical science?

The skeptic, however, might refine the challenge as follows: “It's not,” she might say, “that I insist on sticking to my intuitions, empirical science be damned. Rather, I do not see why the empirical science at issue *needs* to take sides on a dispute about the concept of law.” Of course, it is clear that the empirical social science at issue *does* draw the line between legal and non-legal norms based on pedigree criteria, but the question is whether it *needs* to: the natural lawyer could agree with the social scientists that, e.g., moral and political considerations determine judicial decisions, but contest the assumption that these considerations are not themselves legally binding.

The difficulty, of course, is that the candidate non-law explanatory factors at issue (e.g., an ideological commitment to the platforms of the Republican Party) are not plausible candidates for being legal norms, on any existing theory of the concept of law. Moreover, there are good reasons why social science treats the explanatory factors at issue as non-legal: for example, the moral and political attitudes invoked to explain decisions do not, for example, appear explicitly in the text of the decisions, or in the explicit rationales for the decisions; they are often *hidden* and *hard to detect*, which make them quite unlike any of the paradigm instances of legal norms, like statutory provisions or precedent. Finally, the legal/non-legal demarcation in empirical social science usually reflects more general explanatory premises about the psycho-social factors that account for behavior, well beyond the realm of the legal. The motivation for demarcating the legal/non-legal in essentially Hard Positivist terms is, for most social scientists, to effect an explanatory unification of legal phenomena with other political and social behavior.

Yet the very talk of “legal phenomena” may invite a different kind of objection to the proposed naturalization of jurisprudential questions. For how is it, one might wonder, that the social scientist knows these are *legal* phenomena he is explaining, and not phenomena of some other kind? Does that not already presuppose an analysis of the concept of law? (Cf. Coleman 2001, pp. 213-214.) It is not obvious, though, why a shared language and dictionaries won't suffice to get empirical science off the ground; it is not that empirical science *needs* conceptual analysis to tell his explanatory story, it's rather that *after the fact* the philosopher may be able to offer some greater reflective clarity about the concepts invoked in the explanatory story. Conceptual philosophers are keen to insist that they are not lexicographers; but the intelligibililty of empirical science can get a long way with lexicography alone. To the extent a conceptual analysis helps, it helps *after* we discover which way of cutting the causal joints of the social world works best, according to the naturalist.

3. Replacement Naturalism II: American Legal Realism

The *locus classicus* of the second kind of Replacement Naturalism—the one deriving from an attack on foundationalism—is Quine (1969). The central enterprise of epistemology on Quine's view is to understand the relation between our theories of the world and the evidence (sensory input) on which they are based. Quine's target is one influential construal of this project: Cartesian foundationalism, particularly in the sophisticated form given to it in the twentieth-century by Rudolf Carnap in *Der Logische Aufbau der Welt* (1928). The foundationalist wants an account of the theory-evidence relation that would vindicate the privileged epistemic status of at least some subset of our theories: our theories (in particular, our best theories of natural science) are to be “grounded” in indubitable evidence (i.e., immediate sense impressions). Quine deems foundationalism to be a failure: the semantic part of the program is rendered unrealizable by meaning holism on the one hand (theoretical terms get their meanings from their place in the whole theoretical framework, not in virtue of some point-by-point contact with sensory input), while the epistemic part of the program is defeated by the Duhem-Quine thesis about the underdetermination of theory by evidence on the other (there is always more than one theory consistent with the evidence, in part, because a theoretical hypothesis can always be preserved in the face of recalcitrant evidence by abandoning the auxiliary hypotheses that informed the test of the hypothesis) (see Kim 1988, pp. 385-386).

What becomes, then, of epistemology? Hilary Kornblith has summed up Quine's view as follows: “Once we see the sterility of the foundationalist program, we see that the only genuine questions there are to ask about the relation between theory and evidence and about the acquisition of belief are psychological questions” (Kornblith 1994, p. 4). This view Kornblith aptly dubs Quine's “replacement thesis”: “the view that epistemological questions may be replaced by psychological questions” (Kornblith 1994, p. 3). Here is how Quine puts it:

> The stimulation of his sensory receptors is all the evidence anybody has had to go on,

> ultimately, in arriving at his picture of the world. Why not just see how this construction really proceeds? Why not settle for psychology? Such a surrender of the epistemological burden to psychology is a move that was disallowed in earlier time as circular reasoning. If the epistemologist's goal is validation of the grounds of empirical science, he defeats his purpose by using psychology or other empirical science in the validation. However, such scruples against circularity have little point once we have stopped dreaming of deducing science from observations. (1969, pp. 75-76)

Several pages later, Quine continues that on his proposal,

> Epistemology, or something like it, simply falls into place as a chapter of psychology and hence of natural science. It studies a natural phenomenon, viz., a physical subject. This human subject is accorded a certain experientially controlled input—certain patterns of irradiation in assorted frequencies, for instance—-and in the fullness of time the subject delivers as output a description of the three-dimensional external world and its history. The relation between the meager input and the torrential output is a relation that we are prompted to study for somewhat the same reasons that always prompted epistemology; namely, in order to see how evidence relates to theory, and in what ways one's theory of nature transcends any available evidence. (1969, pp. 82-83)

Thus Quine: the central concern of epistemology is the theory-evidence relationship; if the foundationalist story about this relationship is a failure, then that leaves only one story worth telling about this relationship: namely, the story told by “a purely descriptive, causal-nomological science of human cognition” (Kim 1988, p. 388). The science of human cognition *replaces* armchair epistemology: we naturalize epistemology by turning over its central question—the relationship between theory and evidence—to the relevant empirical science.

We can now generalize Quine's point as follows (Leiter 1998). Let us say that a Replacement Naturalist in any branch of philosophy holds that:

> For any pair of relata that might stand in a *justificatory* relation—e.g., evidence and theory, reasons and belief, causal history and semantic or intentional content, legal reasons and judicial decision—if no normative account of the relation is possible, then the only theoretically fruitful account is the descriptive/explanatory account given by the relevant science of that domain.

This goes beyond Quine in one important respect: for Quine infers Replacement Naturalism only from the failure of *foundationalism*—which is simply one possible normative account of the evidence-theory relationship, but not the only one. Quine's arguments simply do not show that no other normative account of the evidence-theory relationship is possible.

Quine has been extensively criticized on precisely this score (e.g., Goldman 1986, pp. 2-3; Kim 1988).

The key to a successful defense of Replacement Naturalism lies in an explanation of why normative theory without foundationalism is *sterile*. One worry is that without foundationalism, normative theories are *banal*. Consider: it is now a familiar result of cognitive psychology that human beings regularly make mistakes in logical reasoning (cf. Stich 1994). So a mere descriptive theory of belief-formation, of the sort Quine appears to recommend, would simply record these mistakes. But shouldn't epistemology tell us that beliefs *ought* not to be formed illogically? One can hardly imagine why Quine would disagree: one *ought* not to form beliefs illogically. But the question is whether this piece of banal advice adds up to a fruitful research program? The descriptive project of Replacement Naturalism may record certain irrational cognitive processes in studying the evidence-theory relationship, but given the underdetermination of theory by evidence, even when we correct for logical mistakes, we still won't have an account of which of our theoretical beliefs are warranted and which are not. The Quinean intuition is we'll learn more from the empirical inquiry, than from systematizing our banal normative intuitions about irrationality. More generally, *unless* we have some foundational point outside our epistemic practices from which to assess the epistemic issues, the project of systematizing our mundane normative intuitions will simply collapse into the descriptive sociology of knowledge. If we can't stand outside the epistemological boat, then we can do no more than report what it is we do. But it is precisely the viability of such an external standpoint that Quine denies in his embrace of the metaphor of Neurath's boat. So from within the boat, there is nothing *to do* but description.

Quine's argument for Replacement Naturalism, recall, moved in two steps. Step one was *anti-foundationalism*: no unique theory is justified on the basis of the evidential input. Step two was *replacement*: since no foundational story can be told about the relation between input (evidence) and output (theory), we should replace the normative program with a purely descriptive inquiry, e.g. the psychological study of what input causes what output. We can find analogues of both steps in the approach to the theory of adjudication offered by American Legal Realism.

Theory of adjudication is concerned *not* with the relationship between "evidence" and "scientific theory," but rather with the justificatory relationship between "legal reasons" (the input, as it were) and judicial decision (the output): theory of adjudication tries to tell judges how they *ought* to justify their decisions, i.e. it seeks to "ground" judicial decision-making in reasons that require unique outcomes. The American Legal Realists are "anti-foundationalists" about judicial decisions in the sense that they deny that the legal reasons justify a unique decision: the legal reasons underdetermine the decision (at least in most cases actually litigated). More precisely, the Realists claim that the law is *rationally* indeterminate in the sense that the class of legal reasons—i.e., the class of legitimate reasons a judge may offer for a decision—does not provide a *justification* for a unique outcome. Just as sensory input does not *justify* a unique scientific theory, so legal reasons, according to the Realists, do not *justify* a unique decision.

The Realists also take the second step that Quine takes: replacement. According to the Realist indeterminacy thesis, legal reasons do not justify a unique decision, meaning that the foundationalist enterprise of theory of adjudication is impossible. Why not replace, then, the "sterile" foundational program of justifying some one legal outcome on the basis of the applicable legal reasons, with a descriptive/explanatory account of what input (that is, what combination of facts and reasons) produces what output (i.e., what judicial decision)? As Underhill Moore puts it at the beginning of one of his

articles: “This study lies within the province of jurisprudence. It also lies within the field of behavioristic psychology. It places the province within the field” (Moore & Callahan 1943, p. 1). Notice how closely this echoes Quine's idea that, “Epistemology…simply falls into place as a chapter of psychology…” (1969, p. 82). Jurisprudence—or, more precisely, the theory of adjudication—is “naturalized” because it falls into place, for the Realist, as a chapter of psychology (or economics or sociology, etc.). Moreover, it does so for essentially Quinean reasons: because the foundational account of adjudication is a failure—a consequence of accepting the Realists' famous claim that the law is indeterminate.

Of course, this argument for Replacement Naturalism only seems to work against “formalist” theories of adjudication that are committed to the rational determinacy of law. But, some object, “No contemporary analytic jurisprudent is a formalist” (Coleman 1998, p. 284), and some have even claimed that the “formalists” the Legal Realists opposed were not committed to the rational determinacy of law (Paulson 2001, p. 78). Both objections seem mistaken: Dworkin, for example, is committed to the rational determinacy of law in exactly the sense at issue for the Replacement argument. And it is even conceded that all legal theorists are committed to the rational determinacy of law in “at least some legal disputes” (Coleman 1998, p. 284), thus making them vulnerable, in principle, to the Replacement argument. The targets of the Legal Realist critique were, equally, committed to the rational determinacy of law; indeed, it would be impossible to make sense of what the Realists were doing if that were not so. The Replacement Naturalist might take the view that there is no reason to call for “naturalizing” theory of adjudication in those range of cases where legal reasons *are* satisfactory predictors of legal outcomes (i.e., precisely those cases where the foundationalist program can be carried out). One may worry, again, about whether there is an *interesting* or *fruitful* normative story to be told (rather than a merely banal descriptive sociology), but it suffices for the analogy with Quine that there remains some substantial domain of cases where the foundational program can not be carried out, so that the case for replacement remains intact.

The real difficulty, of course, pertains not to these historical points, but to whether or not the project of a normative theory of adjudication warrants replacement just because rational determinacy does not obtain. As in the Quinean case, the Replacement Naturalist must maintain that without rational determinacy, normative theories of adjudication are banal, mere excercises in descriptive sociology. Critics of Replacement Naturalism contest this conclusion, though more by way of affirmation than argument (Coleman 1998, p. 285 n. 44). However, if the objection under consideration were correct, then a *normative* theory that specifies what the anti-foundationalist concedes—namely, that there is more than one (though not simply any) judicial decision that can be justified on the basis of the class of legal reasons—must, in some measure, be a theory worth having. Arguably, such a theory might be adequate to deflect the challenge to the political *legitimacy* of adjudication based on the indeterminacy of law, but does it provide the *normative* guidance to judges we want from a theory? Does a theory that tells judges they would be justified (on the basis of the class of legal reasons) in deciding for the plaintiff on theory *X or* the defendant on theory *Y* (but not the plaintiff or defendant on theory Z!) really provide normative guidance for judges worth having? The Replacement Naturalist answers in the negative: better to have a descriptive account of inputs and outputs, one that would license prediction of judicial behavior, than an indeterminate normative theory. This response, of course, makes Replacement Naturalism vulnerable to conflicting intuitions about the fruitfulness or sterility of different kinds of theorizing.

There are other limits to the Quinean analogy (Leiter 2001a, pp. 284-285). First, the American Legal Realists end up presupposing a theory of the concept of legality in framing their arguments for law's indeterminacy (Leiter 1995; Leiter 2001a, pp. 292-293); thus, while they may believe the only fruitful account of *adjudication* is descriptive and empirical, not normative and conceptual, they themselves need a concept of *law* that is not—at least on the arguments considered so far—empirical or naturalized. As one critic of Replacement Naturalism notes: “the naturalist is committed as a conceptual matter to the existence of a test of legality…. The naturalist is thus in the same boat with ever other analytic philosopher of law” (Coleman 2001, p. 214). The analogy with naturalized epistemology, in other words, must be localized to the theory of adjudication, and not the whole of jurisprudence. Of course, it remains possible for the Replacement Naturalist to argue for the requisite concept of legality on precisely the empirical grounds noted in the previous section (“Replacement Naturalism I: Against Conceptual Analysis”). But as it stands, the analogy to Quine's attack on foundationalist epistemology warrants no radical abandonment of traditional conceptual analysis across the boards.

A second difference from Quine is also important: for the crux of the Legal Realist position (at least for the majority of Realists) is that non-legal reasons (e.g., judgments of fairness, or consideration of commercial norms) *explain* the decisions. They, of course, explain the decisions by *justifying* them, though not necessarily by justifying a unique outcome (i.e., the non-legal reasons might themselves rationalize other decisions as well). Now clearly the descriptive story about the non-legal reasons is not going to be part of a non-mentalistic naturalization of the theory of adjudication: a causal explanation of decisions in terms of reasons (even non-legal reasons) does require taking the normative force of the reasons *qua reasons* seriously. The behaviorism of Quine or Underhill Moore is not in the offing here, but surely this is to be preferred: behaviorism failed as a foundation for empirical social science, while social-scientific theories employing mentalistic categories have flourished. Moreover, if the non-legal reasons are themselves indeterminate—i.e., if they do not justify a *unique* outcome—then any causal explanation of the decision will have to go beyond reasons to identify the psyco-social facts (e.g., about personality, class, gender, socialization, etc.) that cause the decision. Such a “naturalization” of the theory of adjudication might be insufficiently austere in its ontology for Quinean scruples, but it is still a recognizable attempt to subsume what judges do within a (social) scientific framework.

4. Normative Naturalism

Like the traditional epistemologist, the Normative Naturalist embraces as his goal the promulgation of norms by which to regulate our epistemic practices (to govern how we should acquire and weigh evidence, as well as, ultimately, form beliefs). Unlike the non-naturalist, however, the Normative Naturalist does not think epistemic norms can be adequately formulated from the armchair: normative theorizing must be continuous with scientific theorizing. But if this is not just to collapse into Replacement Naturalism then what does the M-naturalist credo amount to in the normative case? Consider Goldman's proposal: “Epistemics assumes that cognitive operations should be assessed instrumentally: given a choice of cognitive procedures, those which would produce the best set of *consequences* should be selected” (1978, p. 520). The Normative Naturalist maintains that the reason the

philosopher can't do armchair epistemology is because it is an *a posteriori*, empirical matter what norms *in fact* serve our epistemic or cognitive goals (e.g., forming true beliefs). Goldman emphasizes a particularly important instance of this general point:

> [A]dvice in matters intellectual, as in other matters, should take account of the agent's capacities. There is no point in recommending procedures that cognizers cannot follow or recommending results that cognizers cannot attain. As in the ethical sphere, "ought" implies "can." Traditional epistemology has often ignored this precept. Epistemological rules often seem to have been addressed to "ideal" cognizers, not human beings with limited information-processing resources. Epistemics [as a type of Normative Naturalism] wishes to take its regulative role seriously. It does not want to give merely idle advice, which humans are incapable of following. This means it must take account of the powers and limits of the human cognitive system, and this requires attention to descriptive psychology. (1978, p. 510)

So the Normative Naturalist thinks that normative epistemology must be continuous with natural and social science in (at least) two senses: (i) we need to know what epistemic norms in fact lead to our forming true beliefs; and (ii) as a special case of (i), we need to identify epistemic norms actually usable by creatures like us. This rules out certain (non-naturalistic) epistemic norms which require of cognizers belief-formation practices beyond their ken (Goldman 1978, pp. 512-513). The Normative Naturalist, in short, emphasizes the *instrumental* character of normative theorizing in epistemology, and then argues that the only way to assess instrumental claims is empirically—to see what means *really* brings about what ends. And that task can never be pursued *a priori*, from the armchair, simply by analyzing the meaning of the words "knowledge" or "justified" or "true."

Of course, it bears noting that the Normative Naturalist does not dispense *entirely* with conceptual analysis—to the contrary. It is precisely, for example, Goldman's proffered conceptual analyses of "knowledge" and "justification" that require him to turn to empirical psychology to fill in the actual content of epistemic norms. Unlike the Quinean program, naturalization enters for the Normativist only, as it were, in *applied* epistemology. What many philosophers might think of as "pure" epistemology—giving an account of knowledge—continues to be an *a priori* enterprise, even though it is an enterprise that invokes notions (like "reliability" and "causation") that require *a posteriori* investigation to apply.

The Normative Naturalist in jurisprudence, too, views theoretical questions *instrumentally*. The philosophical foundation of evidence law has, to date, received the most attention from this perspective (Allen & Leiter 2001; Leiter 2001d). We want to ask, as Goldman puts, "Which [social] practices have a comparatively favorable impact on knowledge as contrasted with error and ignorance?" (1999, p. 5). Normative naturalism is, in this respect, *veritistic* (to borrow Goldman's term): it is concerned with the production of knowledge, meaning (in part) *true* belief (Goldman 1999, pp. 79-100). So the Normative Naturalist embraces as his goal the promulgation of norms by which to regulate our epistemic practices so that they yield knowledge. In the case of *individual* epistemology, this means the norms governing how individuals should acquire and weigh evidence as well as, ultimately, form beliefs; in the case of

social epistemology, this means the norms governing the social mechanisms and practices that inculcate belief. The legal rules of evidence, in turn, are a prime case of the latter: for these rules structure the epistemic process by which jurors arrive at beliefs about disputed matters of fact at trials. As such, the rules of evidence are a natural candidate for investigation by Normative Naturalists. We may ask of any particular rule: does it increase the likelihood that jurors will reach *true* beliefs about disputed matters of fact? (Of course, it does not make sense to ask that of *every* rule, since some rules of evidence—for example, Federal Rules of Evidence (FRE) 407-411—are not meant to facilitate the discovery of truth, but to carry out various policy objectives like reducing accidents and avoiding litigation.) That means, of course, asking an essentially *empirical* question: does this rule of inclusion or exclusion *in fact* increase the likelihood that fact finders, *given what they are actually like,* will achieve knowledge about disputed matters of fact (i.e., does it maximize veritistic value). Of course, many rules that on their face invite one kind of veritistic analysis require a very different kind in practice. So, for example, FRE 404, *on its face*, excludes character evidence in most contexts, though, in fact, the exception in 404(b) largely swallows the rule. Thus, while it might seem that we should ask whether *excluding* character evidence maximizes veritistic value, the real question is whether *admitting* it does. The same may be said for the hearsay rule. Although on its face, the hearsay doctrine is a rule of exclusion, in reality it is a rule of admission: what the advocate must really know is how to get the proferred hearsay admitted under one of the multitude of exceptions to the nominal rule of exclusion (FRE 802). Thus, the pertinent veritistic question concerns the veritistic credentials of the grounds on which hearsay is admitted, rather than the veritistic reasons for excluding it in most cases. (Such questions, in fact, are already a staple of much evidence scholarship.)

In theory of adjudication, by contrast, the Normative Naturalist wants to identify norms for adjudication that will help judges realize adjudicative goals. Such norms must, once again, satisfy two naturalistic constraints: first, they must, as a matter of empirical fact, be effective means to goals ("the Instrumental Constraint"); second, they must be constrained by relevant empirical facts about the nature and limitations of judges ("the Ought-Implies-Can Constraint") (Leiter 1998).

Dworkin's theory of ajudication (Dworkin 1986) makes a popular target for the Normative Naturalist. Dworkin's theory says, very roughly, that a judge should decide a case in such a way that it coheres with the principle that *explains* some significant portion of the prior institutional history *and* provides the best *justification* for that history as a matter of political morality. Can a Normative Naturalist be a Dworkinian?

(1) **Instrumental Constraint**: The naturalist assesses normative advice relative to its actual effectiveness for realizing relevant goals. What, then, is the relevant goal in *adjudication*? One candidate is surely this: we want to give judges normative advice that will lead them to reach fair or just outcomes. Thus, the naturalist's question becomes: which piece of normative advice is most effective in *really* helping actual judges realize justice and fairness? It is, at least, an open question whether Dworkin's methodology will be effective in leading judges to do fair things. The fact that his normative theory has had almost no impact whatsoever on American judicial practice over the last thirty years is at least defeasible evidence that it does not appear to be an *effective* methodology (let alone one effective for realizing justice!) (Leiter 1998, p. 102). This latter point is related to the naturalist's second, and more important objection.

(2) **Ought-Implies-Can-Constraint:** One thing judges can not do is what Dworkin's Judge Hercules does. This is a familiar complaint about Dworkin's theory, but naturalized jurisprudence gives it a principled foundation. The naturalistic jurisprudent eschews all normative guidance unusable by real judges; like his naturalized counterpart in epistemology, he does “not want to give merely idle advice, which humans [including judges] are incapable of following” (Goldman 1978, p.510). Dworkin may give judges an “aspirational model” (to borrow Jules Coleman's apt phrase), and the naturalistic jurisprudent need not dispute that; but Descartes gave us an aspirational model in epistemology as well, and that does not make his program any more adequate or relevant by the naturalist's lights. (It *would* be attractive if we could take certain “clear and distinct” ideas, and build up all of knowledge from them.) The naturalist wants normative advice effective for *creatures like us;* demanding of judges Herculean philosophical ingenuity violates this constraint. Aspiration, the naturalist concludes, is not a fit aim of normative advice, which must, first and foremost, offer *effective* means to ends.

5. Substantive Naturalism

There have been two prominent groups of S-naturalists in legal philosophy: the Scandinavian Legal Realists (like Axel Hägerström and Alf Ross), whose austere views about the ontology of the natural world, conjoined with moral skepticism, led them to unusual conclusions about the semantics of legal propositions; and contemporary defenders of a kind of natural law theory (like David Brink, Michael Moore, and Nicos Stavropoulos), who invoke the Causal Theory of Reference associated with Kripke and Putnam to offer an interpretation of some legal predicates in substantively naturalistic terms.

The S-naturalism of the Scandinavian Realists is, today, more a museum piece than a live contender in jurisprudential debate. This is unsurprising in light of its dependence, especially in the work of Ross, on the semantic doctrines of logical positivism and cognate developments, like emotivism in ethics. As one well-known commentator has written, the Scandinavian Realists held that “a proposition which does not admit to being reduced to enunciations of facts can have no real and intelligible meaning” (Bjarup 1999, p. 774). Their allegiance to emotivism (and non-cognitivism more generally) in ethics led the Scandinavian Realists to conclude that normative statements (at least in morality and law—like the emotivists, they simply ignored the question about the status of epistemic norms) had to have a naturalistically respectable reduction if they were to have truth values. For Ross (1958, Ch. 2), this reduction base was a combination of behavioral and psychological facts: to say that, “*X* is a valid law” means to predict that (1) judges will *act* in accordance with that law, and (2) in so acting, they will “feel” themselves bound to do so.

In an influential essay (reviewing Ross 1958), H.L.A. Hart famously demolished this analysis. “A valid law,” said Hart, can not be “a verifiable hypothesis about future judicial behavior and its special motivational feeling” since such an account makes no sense of the “meaning” of judgments of legal validity “in the mouth of a judge who is not engaged in predicting his own or others' behavior or feelings”: “‘This is a valid rule’ said by a judge is an act of recognition; in saying it he recognizes the rule in question as one satisfying certain accepted general criteria for admission as a rule of the system and so as a legal standard of behavior” (1959, p. 165). This critique, expanded upon in Chapter 7 of Hart

(1961), did much to consign Scandinavian Realism to the history of ideas, though it, unfairly, had the same impact on American Legal Realism, which was not, in fact, committed to this semantic analysis (on the latter point, see Leiter 2001a, esp. pp. 290-293).

Just as semantic doctrines more-or-less derived from logical positivism were central to the S-naturalism of Scandinavian Realism, the more recent S-naturalism of writers like Brink, Moore, and Stavropoulos is indebted to the revolution in semantics initiated by Hilary Putnam and Saul Kripke known as the "new" or "causal" theory of reference. These latter doctrines are not—yet in any case—museum pieces, so the derived jurisprudential theses are very much live items of debate. Stavropoulos explains the core semantic ideas on which jurisprudential writers draw as follows:

> Both Kripke and Putnam attack what they call the traditional theory of reference. That theory holds that an expression refers to whatever fits the description with which speakers associate the expression. The relevant description…captures necessary properties of the referent which are knowable *a priori*, as in the case of knowing that a bachelor is an unmarried man. This cannot be true, Kripke and Putnam argue, since expressions refer to the same object in the lips of speakers who can only associate the expression with vague or mistaken descriptions. Indeed, not only individual speakers but the community as a whole can be in error about the true properties of the relevant object. … .The important suggestion being made by Kripke and Putnam is that reference is *object-dependent*. *Which* object 'Aristotle' or 'water' refers to is not determined by the associated description, but turns instead on a matter of fact, namely which object the name-using or term-using practice is directed at. (1996, p. 8)

Thus, if on the old view the "meaning" of an expression (the descriptions speakers associated with it) fixed the reference of the expression, on the new theory, the referent fixes the meaning. "Water" picks out whatever stuff we happened to baptize with the name "water" at the beginning of the "term-using practice." As it happens, that stuff has a distinctive micro-constitution: it is H_20. Thus, "water" refers to stuff that is H_20, and that is what the term means: the stuff that is H_20.

Writers like Brink, Moore, and Stavropoulos propose that when the meaning of expressions in legal rules—and, in particular, the meaning of the moral concepts (like "equality") that figure in some legal rules—is understood in the same way, then it follows that all rules have *determinate* applications: either the facts do or do not fall within the extension of the meaning of the key terms in the rule. The meaning of the rule determines its application, but the meaning is fixed by the *real* referents of the terms in the legal rule. Of course, for this to be a version of S-naturalism, the claim must be that the real referents are themselves things cognizable within a naturalistic framework: so, e.g., it would have to be the case that the legal and moral features of situations picked out by our legal concepts (and the moral concepts embedded in them) must be identical with (or supervenient upon) natural facts: just as there are necessary, *a posteriori* statements of property identity about water, so too there are such statements about legal and moral facts. For example, perhaps the property of being "morally right" is just identical with the property of "maximizing human well-being," where the latter may be understood in purely

psychological and physiological terms. In that case, whether an action *X* is morally right is simply a scientific question about whether action *X* will in fact maximize the relevant kinds of psychological and physiological states in the world. (Most naturalistic moral realisms are based on versions of utilitarianism, precisely because it is easy to see what the naturalistic base of moral properties would be in a utilitarian schema. One peculiar feature of the moral realism of Moore (1992b) is that it is conjoined with a deontological moral theory, yet within a purportedly naturalistic moral realist framework.) The crucial claim, plainly, is that moral facts are to be identified with (or treated as supervenient upon) certain kinds of natural facts. Of course, many philosophers are skeptical that this claim can be made out (e.g., Gibbard 1990).

Problems arise at several different levels with this more recent S-naturalism, though all are traceable to the reliance on the new theory of reference. To begin, there are familiar reasons to be skeptical about whether the new theory of reference is correct, reasons that won't be rehearsed here (see, e.g., Evans 1973, Blackburn 1988). Even granting, however, the correctness of the new theory, it is not obvious how it helps in the case of law. After all, the new theory always seemed most plausible for a limited class of expressions: proper names and natural kind terms. The reason has to do with the implicit essentialism required for the new theory: unless referents have *essential* characteristics—just as “water” has a distinctive and essential molecular constitution—they can not fix meanings. But what is the essence of “due process” or “equal protection?” And what is the “essential” nature of the many artifact terms that populate legal rules (terms like “contract” or “vehicle” or “security interest”)? Unsurprisingly, S-naturalists like Brink and Moore are also moral realists, and also try to give accounts of artifact terms as picking out not “natural kinds” but “functional kinds” (Moore 1992a, pp. 207-208).

Of course, even if the new theory of reference gives the correct account of the meaning of some terms (like natural kind terms), that still does not show that it gives us the right account of meaning for purposes of legal interpretation (cf. Munzer 1985). Suppose the legislature prohibits the killing of “fish” within 100 miles of the coast, intending quite clearly (as the legislative history reveals) to protect whales, but not realizing that “fish” is a natural kind term that does not include whales within its extension. The new theory of reference tells us that the statute protects sea bass but not whales, yet surely a court that interpreted the statute as also protecting whales would not be making a mistake. Indeed, one might think the reverse is true: for a court *not* to protect whales would be to contravene the will of the legislature, and thus, indirectly, the will of the people. What the example suggests is that the correct theory of legal interpretation is *not* a mere matter of philosophical semantics: issues about *political legitimacy*—about the conditions under which the exercise of coercive power by courts can be justified—must inform theories of legal interpretation, and such considerations may even trump considerations of semantics.

The Mathematics of Boolean algebra

Boolean algebra is the algebra of two-valued logic with only sentential connectives, or equivalently of algebras of sets under union and complementation. The rigorous concept is that of a certain kind of algebra, analogous to the mathematical notion of a group. This concept has roots and applications in logic (Lindenbaum-Tarski algebras and model theory), set theory (fields of sets), topology (totally disconnected compact Hausdorff spaces), foundations of set theory (Boolean-valued models), measure theory (measure algebras), functional analysis (algebras of projections), and ring theory (Boolean rings). The study of Boolean algebras has several aspects: structure theory, model theory of Boolean algebras, decidability and undecidability questions for the class of Boolean algebras, and the indicated applications. In addition, although not explained here, there are connections to other logics, subsumption as a part of special kinds of algebraic logic, finite Boolean algebras and switching circuit theory, and Boolean matrices.

1. Definition and simple properties

A Boolean algebra (BA) is a set *A* together with binary operations + and $\cdot$ and a unary operation $-$, and elements 0, 1 of *A* such that the following laws hold: commutative and associative laws for addition and multiplication, distributive laws both for multiplication over addition and for addition over multiplication, and the following special laws:

$$x + (x \cdot y) = x$$
$$x \cdot (x + y) = x$$
$$x + (-x) = 1$$

$$x \cdot (-x) = 0$$

These laws are better understood in terms of the basic example of a BA, consisting of a collection *A* of subsets of a set *X* closed under the operations of union, intersection, complementation with respect to *X*, with members $\varnothing$ and *X*. One can easily derive many elementary laws from these axioms, keeping in mind this example for motivation. Any BA has a natural partial order $\leq$ defined upon it by saying that $x \leq y$ if and only if $x + y = y$. This corresponds in our main example to $\subseteq$. Of special importance is the two-element BA, formed by taking the set *X* to have just one element. An important elementary result is that an equation holds in all BAs if and only if it holds in the two-element BA. Next, we define $x \oplus y = (x \cdot -y) + (y \cdot -x)$. Then *A* together with $\oplus$ and $\cdot$, along with 0 and 1, forms a ring with identity in which every element is idempotent. Conversely, given such a ring, with addition $\oplus$ and multiplication, define $x + y = x \oplus y \oplus (x \cdot y)$ and $-x = 1 \oplus x$. This makes the ring into a BA. These two processes are inverses of one another, and show that the theory of Boolean algebras and of rings with identity in which every element is idempotent are definitionally equivalent. This puts the theory of BAs into a standard object of research in algebra. An atom in a BA is a nonzero element *a* such that there is no element *b* with $0 < b < a$. A BA is atomic if every nonzero element of the BA is above an atom. Finite BAs are atomic, but so are many infinite BAs. Under the partial order $\leq$ above, $x + y$ is the least upper bound of *x* and *y*, and $x \cdot y$ is the greatest lower bound of *x* and *y*. We can generalize this: $\sum X$ is the least upper bound of a set *X* of elements, and $\prod X$ is the greatest lower bound of a set *X* of elements. These do not exist for all sets in all Boolean algebras; if they do always exist, the Boolean algebra is said to be complete.

2. The elementary algebraic theory

Several algebraic constructions have obvious definitions and simple properties for BAs: subalgebras, homomorphisms, isomorphisms, and direct products (even of infinitely many algebras). Some other standard algebraic constructions are more peculiar to BAs. An ideal in a BA is a subset *I* closed under +, with 0 as a member, and such that if $a \leq b \in I$, then also $a \in I$. Although not immediately obvious, this is the same as the ring-theoretic concept. There is a dual notion of a filter (with no counterpart in rings in general). A filter is a subset *F* closed under $\cdot$, having 1 as a member, and such that if $a \geq b \in F$, then also $a \in F$. An ultrafilter on *A* is a filter *F* with the following properties: $0 \notin F$, and for any $a \in A$, either $a \in F$ or $-a \in F$. For any $a \in A$, let $S(a) = \{F : F$ is an ultrafilter on A and $a \in F\}$. Then *S* is an isomorphism onto a BA of subsets of the set *X* of all ultrafilters on *A*. This establishes the basic Stone representation theorem, and clarifies the origin of BAs as concrete algebras of sets. Moreover, the sets $S(a)$ can be declared to be a base for a topology on *X*, and this turns *X* into a totally disconnected compact Hausdorff space. This establishes a one-one correspondence between the class of BAs and the class of such spaces. As a consequence, used very much in the theory of BAs, many topological theorems and concepts have consequences for BAs. If *x* is an element of a BA, we let $0x = -x$ and $1x = x$. If $(x(0), \ldots x(m-1))$ is a finite sequence of elements of a BA *A*, then every element of the subalgebra of *A* generated by $\{x(0), \ldots, x(m-1)\}$ can be written as a sum of monomials $e(0)x(0) \cdot \ldots \cdot e(m-1)x(m-1)$ for *e* in some set of functions mapping $m = \{0, \ldots, m-1\}$ into $2 = \{0, 1\}$. This is an algebraic expression of the disjunctive normal form theorem of sentential logic. A function *f* from a set *X* of generators of a BA *A* into a BA *B* can be extended to a homomorphism if and only if $e(0)x(0) \cdot \ldots \cdot e(m-1)x(m-1) = 0$

always implies that $e(0)f(x(0)) \cdot \ldots \cdot e(m - 1)f(x(m - 1)) = 0$. This is Sikorski's extension criterion. Every BA A can be embedded in a complete BA B in such a way that every element of B is the least upper bound of a set of elements of A. B is unique up to A-isomorphism, and is called the completion of A. If f is a homomorphism from a BA A into a complete BA B, and if A is a subalgebra of C, then f can be extended to a homomorphism of C into B. This is Sikorski's extension theorem. Another general algebraic notion which applies to Boolean algebras is the notion of a free algebra. This can be concretely constructed for BAs. Namely, the free BA on κ is the BA of closed-open subsets of the two element discrete space raised to the κ power.

3. Special classes of Boolean algebras

There are many special classes of Boolean algebra which are important both for the intrinsic theory of BAs and for applications:

- Atomic BAs, already mentioned above
- Atomless BAs, which are defined to be BAs without any atoms. For example, any infinite free BA is atomless.
- Complete BAs, defined above. These are specially important in the foundations of set theory.
- Interval algebras. These are derived from linearly ordered sets $(L, <)$ with a first element as follows. One takes the smallest algebra of subsets of L containing all of the half-open intervals $[a, b)$ with a in L and b in L or equal to ∞. These BAs are useful in the study of Lindenbaum-Tarski algebras. Every countable BA is isomorphic to an interval algebra, and thus a countable BA can be described by indicating an ordered set such that it is isomorphic to the corresponding interval algebra.
- Tree algebras. A tree is a partially ordered set $(T, <)$ in which the set of predecessors of any element is well-ordered. Given such a tree, one considers the algebra of subsets of T generated by all sets of the form $\{b : a \leq b\}$ for some a in T.
- Superatomic BAs. These are BAs which are not only atomic, but are such that each subalgebra and homomorphic image is atomic.

4. Structure theory and cardinal functions on Boolean algebras

Much of the deeper theory of Boolean algebras, telling about their structure and classification, can be formulated in terms of certain functions defined for all Boolean algebras, with infinite cardinals as values. We define some of the more important of these cardinal functions, and state some of the known structural facts, mostly formulated in terms of them

1. The cellularity $c(A)$ of a BA is the supremum of the cardinalities of sets of pairwise disjoint elements of A.

2. A subset *X* of a BA *A* is independent if *X* is a set of free generators of the subalgebra that it generates. The independence of *A* is the supremum of cardinalities of independent subsets of *A*.
3. A subset *X* of a BA *A* is dense in *A* if every nonzero element of *A* is $\geq$ a nonzero element of *X*. The π-weight of *A* is the smallest cardinality of a dense subset of *A*.
4. Two elements *x*, *y* of *A* are incomparable if neither one is $\leq$ the other. The supremum of cardinalities of subset *X* of *A* consisting of pairwise incomparable elements is the incomparability of *A*.
5. A subset *X* of *A* is irredundant if no element of *X* is in the subalgebra generated by the others.

An important fact concerning cellularity is the Erdos-Tarski theorem: if the cellularity of a BA is a singular cardinal, then there actually is a set of disjoint elements of that size; for cellularity regular limit (inaccessible), there are counterexamples. Every infinite complete BA has an independent subset of the same size as the algebra. Every infinite BA *A* has an irredundant incomparable subset whose size is the π-weight of *A*. Every interval algebra has countable independence. A superatomic algebra does not even have an infinite independent subset. Every tree algebra can be embedded in an interval algebra. A BA with only the identity automorphism is called rigid. There exist rigid complete BAs, also rigid interval algebras and rigid tree algebras.

5. Decidability and undecidability questions

A basic result of Tarski is that the elementary theory of Boolean algebras is decidable. Even the theory of Boolean algebras with a distinguished ideal is decidable. On the other hand, the theory of a Boolean algebra with a distinguished subalgebra is undecidable. Both the decidability results and undecidablity results extend in various ways to Boolean algebras in extensions of first-order logic.

6. Lindenbaum-Tarski algebras

A very important construction, which carries over to many logics and many algebras other than Boolean algebras, is the construction of a Boolean algebra associated with the sentences in a first-order theory. Let *T* be a first-order theory in a first-order language *L*. We call formulas φ and ψ equivalent provided that $T \vdash \varphi \leftrightarrow \psi$. The equivalence class of a sentence φ is denoted by $[\varphi]$. Let *A* be the collection of all equivalence classes under this equivalence relation. We can make *A* into a BA by the following definitions, which are easily justified:

$$[\varphi] + [\psi] = [\varphi \vee \psi]$$

$$[\varphi] \cdot [\psi] = [\varphi \wedge \psi]$$

$$-[\varphi] = [\neg \varphi]$$

$$0 = [F]$$

$$1 = [T]$$

Every BA is isomorphic to a Lindenbaum-Tarski algebra. However, one of the most important uses of these classical Lindenbaum-Tarski algebras is to describe them for important theories (usually decidable theories). For countable languages this can be done by describing their isomorphic interval algebras. Generally this gives a thorough knowledge of the theory. Some examples are:

	Theory	**Isomorphic to interval algebra on**
(1)	essentially undecidable theory	**Q**, the rationals
(2)	BAs	$\mathbb{N} \times \mathbb{N}$, square of the positive integers, ordered lexicographically
(3)	linear orders	**A** $\times$ **Q** ordered antilexicographically, where **A** is $\mathbb{N}$ to the $\mathbb{N}$ power in its usual order
(4)	abelian groups	(**Q** + **A**) $\times$ **Q**

7. Boolean-valued models

In model theory, one can take values in any complete BA rather than the two-element BA. This Boolean-valued model theory was developed around 1950--1970, but has not been worked on much since. But a special case, Boolean-valued models for set theory, is very much at the forefront of current research in set theory. It actually forms an equivalent way of looking at the forcing construction of Cohen, and has some technical advantages and disadvantages. Philosophically it seems more satisfactory than the forcing concept. We describe this set theory case here; it will then become evident why only compete BAs are considered. Let B be a complete BA. First we define the Boolean valued universe $V(B)$. The ordinary set-theoretic universe can be identified with $V(2)$, where 2 is the 2-element BA. The definition is by transfinite recursion, where α, β are ordinals and λ is a limit ordinal:

$V(B, 0) = \varnothing$

$V(B, \alpha + 1) =$ the set of all functions f such that the domain of f is a subset of $V(B, \alpha)$ and the range of f is a subset of B

$V(B, \lambda) =$ the union of all $V(B, \beta)$ for $\beta < \lambda$.

The B-valued universe is the proper class $V(B)$ which is the union of all of these Vs. Next, one defines by a rather complicated transfinite recursion over well-founded sets the value of a set-theoretic formula with elements of the Boolean valued universe assigned to its free variables

$$||x \in y|| = \sum \{(||x = t|| \cdot y(t)) : t \in \text{domain}(y)\}$$

$$||x \subseteq y|| = \prod \{-x(t) + ||t \in y|| : t \in \text{domain}(x)\}$$

$$||x = y|| = ||x \subseteq y|| \cdot ||y \subseteq x||$$

$$\|\neg\varphi\| = -\|\varphi\|$$

$$\|\varphi \vee \psi\| = \|\varphi\| + \|\psi\|$$

$$\|\exists x\varphi(x)\| = \sum\{\|\varphi(a)\| : a \in V(B)\}$$

Species

The nature of species is controversial in biology and philosophy. Biologists disagree on the definition of the term "species." Philosophers disagree over the ontological status of species. A proper understanding of species is important for a number of reasons. Species are the fundamental taxonomic units of biological classification. Environmental laws are framed in terms of species. Even our conception of human nature is affected by our understanding of species. In this entry, three philosophical issues concerning species are discussed. The first is the ontological status of species. The second is whether biologists should be species pluralists or species monists. The third is whether the theoretical term "species" refers to a real category in nature.

Overview

What are biological species? At first glance, this seems like an easy question to answer. *Homo sapiens* is a species, and so is *Canis familaris* (dog). Many species can be easily distinguished. When we turn to the technical literature on species, the nature of species becomes much less clear. Biologists offer a dozen definitions of the term "species" (Claridge, Dawah, and Wilson 1997). These definitions are not fringe accounts of species but prominent definitions in the current biological literature. Philosophers also disagree on the nature of species. Here the concern is the ontological status of species. Some

philosophers believe that species are natural kinds. Others maintain that species are particulars or individuals.

The concept of species plays an important role both in and outside of biology. Within biology, species are the fundamental units of biological classification. Species are also units of evolution — groups of organisms that evolve in a unified way. Outside of biology, the concept of species plays a role in debates over environmental law and ecological preservation. Our conception of species even affects our understanding of human nature. From a biological perspective, humans are the species *Homo sapiens*.

This entry discusses three philosophical issues concerning species. The first issue is their ontological status. Are species natural kinds, individuals, or sets? The second issue concerns species pluralism. Monists argue that biologists should attempt to find the correct definition of "species." Pluralists disagree. They argue that there is no single correct definition of "species" but a plurality of equally correct definitions. The third issue concerns the reality of species. Does the term "species" refer to a real category in nature? Or, as some philosophers and biologists argue, is the term "species" a theoretically empty designation?

The Ontological Status of Species

The Death of Essentialism

Since Aristotle, species have been paradigmatic examples of natural kinds with essences. An essentialist approach to species makes perfect sense in a pre Darwinian context. God created species and an eternal essence for each species. After God's initial creation, each species is a static, non evolving group of organisms. Darwinism offers a different view of species. Species are the result of speciation. No qualitative feature — morphological, genetic, or behavioral — is considered essential for membership in a species. Despite this change in biological thinking, many philosophers still believe that species are natural kinds with essences. Let us start with a brief introduction to kind essentialism and then turn to the biological reasons why species fail to have essences.

Kind essentialism has a number of tenets. One tenet is that all and only the members of a kind have a common essence. A second tenet is that the essence of a kind is responsible for the traits typically associated with the members of that kind. For example, gold's atomic structure is responsible for gold's disposition to melt at certain temperatures. Third, knowing a kind's essence helps us explain and predict those properties typically associated with a kind. The application of any of these tenets to species is problematic. But to see the failure of essentialism we need only consider the first tenet.

Biologists have had a hard time finding biological traits that occur in all and only the members of a species. Even such pre Darwinian essentialists as Linnaeus could not locate the essences of species (Ereshefsky 2001). Evolutionary theory explains why. A number of forces conspire against the universality and uniqueness of a trait in a species (Hull 1965). Suppose a genetically based trait were

found in all the members of a species. The forces of mutation, recombination and random drift can cause the disappearance of that trait in a future member of the species. All it takes is the disappearance of a trait in one member of a species to show that it is not essential. The universality of a biological trait in a species is fragile.

Suppose, nevertheless, that a trait occurs in all the members of a species. That trait is the essence of a species only if it is unique to that species. Yet organisms in different species often have common characteristics. Again, biological forces work against the uniqueness of a trait within a single species. Organisms in related species inherit similar genes and developmental programs from their common ancestors. These common stores of developmental resources cause a number of similarities in the organisms of different species. Another source of similar traits in different species is parallel evolution. Species frequently live in similar habitats with comparable selection pressures. Those selection pressures cause the prominence of similar traits in more than one species. The parallel evolution of opposable thumbs in primates and pandas is an example.

The existence of various evolutionary forces does not rule out the possibility of a trait occurring in all and only the members of a species. But consider the conditions such a trait must satisfy. A species" essential trait must occur in all the members of a species for the entire life of that species. Moreover, if that trait is to be unique to that species, it cannot occur in any other species for the entire existence of life on this planet. The temporal parameters that species essentialism must satisfy are quite broad. The occurrence of a biological trait in all and only the members of a species is an empirical possibility. But given current biological theory, that possibility is unlikely.

Other arguments have been mustered against species essentialism. Hull (1965) contends that species have vague boundaries and that such vagueness is incompatible with the existence of species specific essences. According to Hull, essentialist definitions of natural kinds require strict boundaries between those kinds. But the boundaries between species are vague. In all but a few cases, speciation is a long and gradual process such that there is no principled way to draw a precise boundary between one species and the next. As a result, species cannot be given essentialist definitions. (Hull's argument against species essentialism is very similar to one of Locke's (1894[1975], III, vi) arguments against kind essentialism.)

Sober (1980) raises a different objection to species essentialism. He illustrates how essentialist explanations have been replaced by evolutionary ones. Essentialists explain variation within a species as the result of interference in the ontogenetic development of a species" organisms. Organisms have species specific essences, but interference often prevents the manifestations of those essences. Contemporary geneticists offer a different explanation of variation within a species. They cite the gene frequencies of a species as well as the evolutionary forces that affect those frequencies. No species specific essences are posited. Contemporary biology can explain variation within a species without positing a species" essence. So according to Sober, species essentialism has become theoretically superfluous.

In a pre Darwinian age, species essentialism made sense. Such essentialism, however, is out of step with

contemporary evolutionary theory. Evolutionary theory provides its own methods for explaining variation within a species. It tells us that the boundaries between species are vague. And it tells us that a number of forces conspire against the existence of a trait in all and only the members of a species. From a biological perspective, species essentialism is no longer a plausible position.

Species as Individuals

Let us turn to the prevailing view of the ontological status of species. Ghiselin (1974) and Hull (1978) suggest that instead of viewing species as natural kinds we should think of them as individuals. Hull draws the ontological distinction this way. (Instead of talking of "natural kinds," Hull uses the term "classes.") Classes are groups of entities that can function in scientific laws. One requirement of such laws is that they are true at any time and at any place in the universe. If "All water freezes at 0?C" is a law, then that law is true here and now, as well as 100,000 years ago on some distant planet. Water is a class because samples of water are spatiotemporally unrestricted —water can occur anywhere in the universe. Individuals, unlike classes, consist of parts that are spatiotemporally restricted. Think of a paradigmatic individual, a single mammalian organism. The parts of that organism cannot be scattered around the universe at different times if they are parts of a living, functioning organism. Various biological processes, such as digestion and respiration, require that those parts be causally and spatiotemporally connected. The parts of such an organism can only exist in a particular space-time region. In brief, individuals consist of parts that are spatiotemporally restricted. Classes consist of members that are spatiotemporally unrestricted.

Given the class/individual distinction, Ghiselin and Hull argue that species are individuals, not classes. Their argument assumes that the term "species" is a theoretical term in evolutionary theory. So their argument concerning the ontological status of species focuses on the role of "species" in evolutionary biology. Here is Hull's version of the argument, which can be dubbed the "evolutionary unit argument."

The Evolutionary Unit Argument: Since Darwin, species have been considered units of evolution. When Hull and others assert that species are units of evolution, they do not simply mean that the gene frequencies of a species change from one generation to the next. They have a more significant form of evolution in mind, namely a trait going from being rare to being prominent in a species. A classic example of such evolution is the change in coloration of peppered moths in Nineteenth Century England. Prior to the industrial revolution, peppered moths were light gray with black specks. During the industrial revolution, selection caused peppered moths to become coal black.

A number of processes can cause a trait to become prominent in a species. Hull highlights selection. Selection causes a trait to become prominent in a species only if that trait is passed down from one generation to the next. If a trait is not heritable, the frequency of that trait will not increase cumulatively. Hereditary relations, genetic or otherwise, require the generations of a species to be causally connected. Reproduction requires the generations of a species to be causally and hence spatiotemporally connected. So, if species are to evolve in non trivial ways by natural selection, they must be spatiotemporally continuous entities. Given that species are units of evolution, species are individuals and not classes.

The conclusion that species are individuals has a number of interesting implications. For one, the relationship between an organism and its species is not a member/class relation but a part/whole relation. An organism belongs to a particular species only if it is appropriately causally connected to the other organisms in that species. The organisms of a species must be parts of a single evolving lineage. If belonging to a species turns on an organism's insertion in a lineage, then qualitative similarity can be misleading. Two organisms may be very similar morphologically, genetically, and behaviorally, but unless they belong to the same spatiotemporally continuous lineage they cannot belong to the same species. Think of an analogy. Being part of my immediate family turns on my wife, my children and I having certain biological relations to one another, not our having similar features. It does not matter that my son's best friend looks just like him. That friend is not part of our family. Similarly, organisms belong to a particular species because they are appropriately causally connected, not because they look similar (if they indeed do).

Another implication of the species are individuals thesis concerns our conception of human nature (Hull 1978). As we have seen, species are first and foremost genealogical lineages. An organism belongs to a species because it is part of a lineage not because it has a particular qualitative feature. Humans may be a number of things. One of them is being the species *Homo sapiens*. From an evolutionary perspective, there is no biological essence to being a human. There is no essential feature that all and only humans must have to be part of *Homo sapiens*. Humans are not essentially rational beings or social animals or ethical agents. An organism can be born without any of these features and still be a human. From a biological perspective, being part of the lineage *Homo sapiens* is both necessary and sufficient for being a human. (For further implications of the individuality thesis, see Hull 1978.)

Responses to the Individuality Thesis

Some philosophers think that Hull and Ghiselin too quickly dismiss the assumption that species are natural kinds. Kitcher (1984) believes that species are sets of organisms. Thinking of species as sets is an ontologically neutral stance. It allows that some species are spatiotemporally restricted sets of organisms, that is, individuals. And it allows that other species are spatiotemporally unrestricted sets of organisms.

Why does Kitcher believe that some species are individuals and other species are spatiotemporally unrestricted sets? Following the biologist Ernst Mayr, Kitcher suggests that there are two fundamental types of explanation in biology: those that cite *proximate* causes and those that cite *ultimate causes*. Proximate explanations cite the more immediate cause of a trait, for example, the genes or developmental pathways that cause the occurrence of a trait in an organism. Ultimate explanations cite the evolutionary cause of a trait in a species, for example, the selection forces that caused the evolution of thumbs in pandas and their ancestors.

For each type of explanation, Kitcher believes that there are corresponding definitions of the term "species" (what biologists call 'species concepts"). Proximate explanations cite species concepts based on structural similarities, such as genetic, chromosomal and developmental similarities. These species concepts assume that species are spatiotemporally unrestricted sets of organisms. Ultimate explanations

cite species concepts that assign species evolutionary roles. These species concepts assume that species lineages and thus individuals.

Kitcher is correct that biologists attempt to explain the traits of organisms in two ways: sometimes they cite the ultimate, or evolutionary, cause of a trait; other times they cite a structural feature of an organism with that trait. A problem with Kitcher's approach is his characterization of biological practice. Biologists since Darwin have taken species to be evolutionary units. A glance at a biology text book will reveal that the evolutionary approach to species is the going concern in biology. The groups that correspond to Kitcher's structural concepts are not considered species by taxonomists. Groups of organisms that have genetic, developmental, behavioral and ecological similarities, are natural kinds in biology, but they are not considered species. Consider such groups of organisms as males, females, tree nesters and diploid organisms. These groups of organisms cut across species. For instance, some but not all humans are males and many organisms in other species are males. Male is a kind in biology, but it is not a species. Kitcher's motivation for asserting that species are sets is to allow spatiotemporally unrestricted groups of organisms to form species. That motivation, however, is not substantiated by biological theory or practice.

A more recent account of species as natural kinds is found in Boyd (1999), Griffiths (1999), and Wilson (1999). Their approach to species relies on Boyd's theory of natural kinds. According to Boyd, natural kinds are *homeostatic property cluster kinds*. The members of such a kind share a number of co-occurring properties that can be cited in prediction and explanation. The co-occurrence of such properties is due to a kind's causal homeostatic mechanisms. Turning to species, the organisms in *Canis familaris* share a number of similar properties that are sufficiently stable for use in explanation and prediction. The stability of those properties are the result of such causal homeostatic mechanisms as gene flow, stabilizing pressure and developmental homeostasis.

Boyd's approach to natural kinds is distinct from the traditional essentialist approach to kinds in several ways. First, membership in a kind does not require the occurrence of a universal and unique property in all the members of a kind. Thus Boyd's account allows that species can be natural kinds without requiring that the members of a species share a qualitative essence. Second, Boyd's account allows species to vary at a time and over time. Species can be natural kinds even though they evolve. There is some limit to the variability allowed in a species, however. Species must be sufficiently stable so that better than chance predictions can be made about some of the properties of a species.

A third way that Boyd's account of natural kinds differs from the traditional account is that Boyd allows natural kinds to be spatiotemporally restricted entities. Natural kinds, in other words, can be individuals, so long as the members of a natural kind are sufficiently stable to allow prediction and explanation. Boyd's account brings species back into the fold of natural kinds by allowing that species can be *both* natural kinds and individuals. Species are natural kinds because species are homeostatic property cluster kinds. Species are individuals because one of their homeostatic mechanisms is genealogy.

Boyd's approach to species brings unity to the debate over the ontological status of species. Such unity is

appealing if one does not mind deflating the distinction between kinds and individuals. On Boyd's approach, a particular species, even a particular human (Boyd 1999, 163), is both an individual and a natural kind. Bill Clinton's arms are parts of the individual Bill Clinton. And Bill Clinton's arms are members of the natural kind Bill Clinton. If the idea that Bill Clinton is a natural kind seems unproblematic, then Boyd's assertion that species are both individuals and natural kinds should be just the ontological ticket.

Species Pluralism

Biologists offer various definitions of the term "species" (Claridge, Dawah, and Wilson 1997). Biologists call these different definitions 'species concepts." The Biological Species Concept defines a species as a group of organisms that can successfully interbreed and produce fertile offspring. The Phylogenetic Species Concept (which itself has multiple versions) defines a species as a group of organisms bound by a unique ancestry. The Ecological Species Concept defines a species as a group of organisms that share a distinct ecological niche. These species concepts are just three of a dozen prominent species concepts in the biological literature.

What are we to make of this variety of species concepts? Monists believe that an aim of biological taxonomy is to identify the single correct species concept. Perhaps that concept is among the species concepts currently proposed and we need to determine which concept is the right one. Or perhaps we have not yet found the correct species concept and we need to wait for further progress in biology. Pluralists take a different stand. They do not believe that there is a single correct species concept. Biology, they argue, contains a number of legitimate species concepts. Pluralists believe that the monist's goal of a single correct species concept should be abandoned.

Varieties of Pluralism

Species pluralism comes in various forms (for example, Kitcher 1984, Mishler and Brandon 1987, Dupré 1993, and Ereshefsky 2001). Kitcher and Dupré offer forms of species pluralism that recognize the species concepts mentioned above — biological species, phylogenetic species, and ecological species — as well as other species concepts. As we saw in Section 1.2, Kitcher accepts species concepts that require species to be individuals, and he accepts species concepts based on the structural similarities of organisms. The latter type of species are not spatiotemporally continuous entities. Such species merely need to contain organisms that share theoretically significant properties. Dupré's version of species pluralism is more robust. He recognizes all of the species concepts found in Kitcher's version of pluralism. Dupré's pluralism also allows species concepts based on similarities highlighted by non biologists. For example, Dupré accepts species concepts based on gastronomically significant properties.

If one thinks that the term "species" is a theoretical term found within evolutionary biology, then one might find Dupré's version of pluralism too promiscuous. If the question is how the term "species" is defined in biology, then how it is defined outside of biology does not count. Think of a parallel situation

in physics. When we are interested in the scientific meaning of the term "work" we do not attend to its meaning in the sentence "How was work today?" Similarly, the use of the word "species" by culinary experts does not reveal the theoretical meaning of "species."

Kitcher's pluralism is more circumspect: it limits species concepts to those that are legitimized by theoretical biology. Still, one might worry that Kitcher's form of pluralism is too liberal. Kitcher's pluralism allows that some species are spatiotemporally continuous entities (individuals), while other species may be spatiotemporally unrestricted entities (natural kinds). As we saw in Section 2.1, Hull's evolutionary unit argument states that within the purview of evolutionary biology, species must be individuals. Kitcher's pluralism does not satisfy this requirement: some species can be non individuals. If one assumes that "species" is a theoretical term in evolutionary theory and that species are individuals, then Kitcher's pluralism is too inclusive.

Another version of species pluralism is found in Ereshefsky (2001). This version of pluralism adopts Hull's conclusion that species must be spatiotemporally continuous lineages. Nevertheless, this version of pluralism asserts that there are different types of lineages called "species." The Biological Species Concept and related concepts highlight those lineages bound by the process of interbreeding. The Phylogenetic Species Concepts highlight those lineages of organisms that share a common and unique ancestry. Ecological approaches to species highlight lineages of organisms that are exposed to common sets of stabilizing selection. On this form of species pluralism, the tree of life is segmented by different processes into different types of species lineages.

It is worth noting that the motivation behind Dupré's, Kitcher's and Ereshefsky's versions of pluralism is ontological not epistemological. Some authors (for example, Rosenberg 1994) suggest that we adopt pluralism because of our epistemological limitations. The world is exceedingly complex and we have limited cognitive abilities, so we should accept a plurality of simplified and inaccurate classifications of the world. The species pluralism offered by Dupré, Kitcher, and Ereshefsky is not epistemologically driven. Evolutionary theory, a well substantiated theory, tells us that the organic world is multifaceted. According to Dupré, Kitcher, and Ereshefsky, species pluralism is a result of a fecundity of biological forces rather than a paucity of scientific information.

Responses to Pluralism

Not everyone is willing to accept species pluralism. Monists (for example, Sober 1984, Ghiselin 1987, Hull 1987) have launched a number of objections to species pluralism. One objection centers on the type of lineage that should be accepted as species. Some monists allow the existence of different types of base lineages but contend that only one type of lineage should be called "species" (Ghiselin 1987). Supporters of the Biological Species Concept and related concepts believe that lineages of interbreeding sexual organisms are much more important in the evolution of life on this planet (Eldredge 1985). They argue that only the Biological Species Concept, or some interbreeding concept, should be accepted.

Adopting only an interbreeding approach to species has its costs: it would exclude all asexual organisms

from forming species. Interbreeding requires the genetic contributions of two sexual organisms. Asexual organisms reproduce by themselves, either through cloning, vegetative means or self fertilization. Some reptiles and amphibians reproduce asexually. Many insects reproduce asexually. And asexuality is rampant in plants, fungi and bacteria. In fact, asexual reproduction is the prominent form of reproduction on Earth (Hull 1988). If one adopts an interbreeding approach to species, then most organisms do not form species. This seems a high price to pay for species monism.

Another objection to species pluralism is that pluralism is an overly liberal position (Sober 1984, Ghiselin 1987, Hull 1987). Pluralists allow a number of legitimate species concepts, but how do pluralists determine which concepts should be accepted as legitimate? Should any species concept proposed by a biologist be accepted? What about those concepts proposed by non biologists? Without criteria for determining the legitimacy of a proposed species concept, species pluralism boils down to a position of anything goes.

Species pluralists respect this objection and attempt to respond to it (Dupré 1993, Ereshefsky 2001). They have suggested criteria for judging the legitimacy of a proposed species concept. Such criteria can be used to determine which species concepts should be accepted into the plurality of legitimate species concepts. Candidate criteria are the epistemic virtues that scientists typically use for determining the scientific worthiness of a theory. For example, in judging a species concept, one might ask if the theoretical assumptions of a concept are empirically testable. The Biological Species Concept relies on the assumption that interbreeding causes the existence of stable lineages. It also assumes that organisms that cannot interbreed do not form stable lineages. Whether interbreeding and only interbreeding causes the existence of stable lineages is empirically testable. So the Biological Species Concept has the virtue of empirical sensitivity. Other criteria for judging species concepts include intertheoretic coherence and internal consistency.

The point here is not to bring out an array of proposed species concepts and show how such criteria work in action (Dupré 1993 and Ereshefsky 2001 perform that task). The point is to show that pluralists can provide criteria for discerning which species concepts should be accepted as legitimate. If pluralists can successfully provide such criteria, then the anything goes objection to pluralism is answered.

Does the Species Category Exist?

There is one other item concerning species pluralism worth discussing. Suppose one accepts species pluralism. The term "species" then refers to a variety of different types of lineages. Some species are groups of interbreeding organisms, other species are groups of organisms that share a common ecological niche, and still other species are phylogenetic units. Given that there are different types of species, one might wonder what feature causes these different types of species to be species?

Perhaps they share a common property that renders them species. If one adopts the thesis that all species are genealogical lineages, then a common feature of species is their being lineages. However, this feature is also shared by other types of taxa in the Linnaean Hierarchy. From an evolutionary perspective, all

taxa, whether they be species, genera, or tribes, are genealogical lineages. We need to locate a feature that is not only common in species but also distinguishes species from other types of taxa.

Biological taxonomists often talk in terms of the patterns and processes of evolution. Perhaps there is a process or a pattern that occurs in species but not in other types of taxa. Such a process or pattern would unify the types of lineages we call "species." Let us start with process. The Biological Species Concept highlights those species bound by the process of interbreeding. The Ecological Species Concept identifies those species unified by stabilizing selection. The species highlighted by Phylogenetic Species Concepts are unified by such historical processes as genetic and developmental homeostasis. A survey of these different species concepts reveals that species are bound by different types of processes. So no single type of process is common to all species. Arguably, none of these processes are unique to species either (Mishler and Donoghue 1982).

What about pattern? Do species display a pattern that distinguishes them from other types of taxa? If by pattern we mean ontological structure, then species have different patterns. Species are individuals, but they are different types of individuals. Species of asexual organisms and species of sexual organisms have different structures. Both types of species contain organisms that are genealogically connected to a common ancestor. But the organisms in a sexual species are also connected by interbreeding. Thus species of sexual organisms form causally integrated entities: within a given generation, their members exchange genetic material through sexual reproduction. Species of asexual organisms do not form causally integrated entities: their organisms are merely connected to a common ancestor.

There are other suggestions for the common and unique pattern of species. Many observe that the organisms of a species often look the same or that the organisms of a species share a cluster of reoccurring properties. To the extent that this is true, it is also true of genera and some other higher taxa. The members of some genera tend to look the same and have a cluster of stable properties. Another suggestion for the pattern that distinguishes species is their ability to evolve as a unit — species are the units of evolution, other types of taxa are not. But again, many higher taxa have such unity as well (Mishler and Donoghue 1982).

The above survey of candidate unifying features is far from exhaustive. But the result is clear enough. Species vary in their unifying processes and ontological structure. Furthermore, many features that biologists and philosophers highlight as unique to species occur in many higher taxa as well. Given this survey, what position should we adopt concerning the nature of species? There are several options. According to one option we should keep looking for the unifying feature of species. This is the option favored by some monists (for example, Sober 1984). Contemporary biology may not have discovered the unifying feature of species, but that does not mean that biology will not find such a feature in the future. To give up the search for the unifying nature of species would be too hasty.

Another option starts with the assumption that the search for the unifying feature of species has gone on long enough. Biologists have looked long and hard for the correct definition of "species." The result of that search is not that we do not know what species are. The result is that the organic world contains

different types of species. The conclusion drawn by some pluralists (Kitcher 1984, Dupré 1993) is that the term "species" should be given a disjunctive definition. Species are either interbreeding lineages, or ecological lineages, or phylogenetic units, or? .

A third option, like the previous one, assumes that biologists have looked long enough for the unifying feature of species. In that search, biology has learned that there are different types of lineages called "species." But proponents (Ereshefsky 1998) of this option do not opt for a disjunctive definition of "species." According to this option, we should doubt the very existence of the category species. Those lineages we call "species" vary in their patterns and processes. Furthermore, the distinction between species and other types of taxa is riddled with vagueness. Consequently, we should doubt whether the term "species" refers to a real category in nature.

To better understand this third option it is useful to see more precisely what is being doubted. Biologists make a distinction between the *species category* and *species taxa*. Species taxa are the individual lineages we call "species." *Homo sapiens* and *Canis familaris* are species taxa. The species category is a more inclusive entity. The species category is the class of all species taxa. The third option does not call into question the existence of *Homo sapiens* or *Canis familaris* or any other lineage that we call "species." The third option just calls into question the existence of the categorical rank of species.

Darwin may have had this third option in mind when he wrote his friend Joseph Hooker:

> It is really laughable to see what different ideas are prominent in various naturalists' minds, when they speak of "species"; in some, resemblance is everything and descent of little weight — in some, resemblance seems to go for nothing, and Creation the reigning idea — in some, sterility an unfailing test, with others it is not worth a farthing. It all comes, I believe, from trying to define the indefinable (December 24, 1856; in F. Darwin 1887, vol. 2, 88.).

Darwin considers the term "species" indefinable. He could mean a couple of things by this. Perhaps Darwin meant that the term "species" is an indefinable primitive term in evolutionary theory though he still believed in the existence of the species category. Or perhaps Darwin doubted the existence of the species category altogether. According to Beatty (1985), Darwin doubted the existence of the species category. There is also evidence that he doubted the existence of the other Linnaean categories (Ereshefsky 2001). Still, Darwin believed in the existence of those lineages we call "species.' He just doubted whether the species category and the other Linnaean categories — the grid we place on the tree of life — exists in nature.

This encyclopedia entry started with the observation that at an intuitive level the nature of species seems fairly obvious. But a review of the technical literature reveals that our theoretical understanding of species is far from settled. The debate over the nature of species involves a number of issues. One issue is their ontological status: are species natural kinds or individuals or both? A second issue concerns pluralism: should we adopt species monism or species pluralism? A third issue, and perhaps the most

fundamental issue, is whether the term "species" refers to a real category in nature.

Confucius

Confucius (551-479 BCE), according to Chinese tradition, was a thinker, political figure, educator, and founder of the *Ru* School of Chinese thought. His teachings, preserved in the *Analects*, form the foundation of much of subsequent Chinese speculation on the education and comportment of the ideal man, how such an individual should live his live and interact with others, and the forms of society and government in which he should participate. Fung Yu-lan, one of the great 20th century authorities on the history of Chinese thought, compares Confucius' influence in Chinese history with that of Socrates in the West.

1. Confucius' Life

The sources for Confucius' life are later and do not carefully separate fiction and fact. Thus it is wise to regard much of what is known of him as legendary. Many of the legends surrounding Confucius at the end of the 2nd century BCE were included by the Han dynasty court historian, Sima Qian (145-c.85 BCE), in his well-known and often-quoted *Records of the Grand Historian* (*Shiji*). This collection of tales opens by identifying Confucius' ancestors as members of the Royal State of Song. It notes as well that his great grandfather, fleeing the turmoil in his native Song, had moved to Lu, somewhere near the present town of Qufu in southeastern Shandong, where the family became impoverished. Confucius is described, by Sima Qian and other sources, as having endured a poverty-stricken and humiliating youth and been forced, upon reaching manhood, to undertake such petty jobs as accounting and caring for livestock. Sima Qian's account includes the tale of how Confucius was born in answer to his parents' prayers at a sacred hill (*qiu*) called Ni. Confucius' surname *Kong* (which means literally an utterance of thankfulness when prayers have been answered), his tabooed given name *Qiu*, and his social name

Zhongni, all appear connected to the miraculous circumstances of his birth. This casts doubt, then, on Confucius' royal genealogy as found in Sima Qian. Similarly, Confucius' recorded age at death, ‘seventy-two,’ is a ‘magic number’ with far-reaching significance in early Chinese literature. We do not know how Confucius himself was educated, but tradition has it that he studied ritual with the Daoist Master Lao Dan, music with Chang Hong, and the lute with Music-master Xiang. In his middle age Confucius is supposed to have gathered about him a group of disciples whom he taught and also to have devoted himself to political matters in Lu. The number of Confucius' disciples has been greatly exaggerated, with Sima Qian and other sources claiming that there were as many as three thousand of them. Sima Qian goes on to say that, “Those who, in their own person, became conversant with the Six Disciplines [taught by Confucius], numbered seventy-two.” The 4th century BCE *Mencius* and some other early works give their number as seventy. Perhaps seventy or seventy-two were a maximum, though both of these numbers are suspicious given Confucius' supposed age at death.

At the age of fifty, when Duke Ding of Lu was on the throne, Confucius' talents were recognized and he was appointed Minister of Public Works and then Minister of Crime. But Confucius apparently offended members of the Lu nobility who were vying with Duke Ding for power (or was it the duke himself that Confucius had rubbed the wrong way?) and he was subsequently forced to leave office and go into exile. As in other ancient cultures, exile and suffering are common themes in the lives of the heroes of the early Chinese tradition. In the company of his disciples, Confucius left Lu and traveled in the states of Wei, Song, Chen, Cai, and Chu, purportedly looking for a ruler who might employ him but meeting instead with indifference and, occasionally, severe hardship and danger. Several of these episodes, as preserved in the *Records of the Grand Historian*, appear to be little more than prose retellings of songs found in the ancient Chinese *Book of Songs*, Confucius' life is thus rendered a re-enactment of the suffering and alienation of the personas of the poems.

In any case, by most traditional accounts, Confucius returned to Lu in 484 BCE and spent the remainder of his life teaching, putting in order the *Book of Songs*, the *Book of Documents*, and other ancient classics, as well as editing the *Spring and Autumn Annals*, the court chronicle of Lu. Sima Qian's account also provides background on Confucius' connection to the early canonical texts on ritual and on music (the latter of which was lost at an early date). Sima Qian claims, moreover, that, “In his later Years Confucius delighted in the *Yi*”—the famous, some might say infamous, divination manual popular to this day in China and in the West. The *Analects* passage which appears to corroborate Sima Qian's claim seems corrupt and hence unreliable on this point. Confucius' traditional association with these works led them and related texts to be revered as the “Confucian Classics” and made Confucius himself the spiritual ancestor of later teachers, historians, moral philosophers, literary scholars, and countless others whose lives and works figure prominently in Chinese intellectual history.

Book X of the *Analects* consists of personal observations of how Confucius comported himself as a thinker, teacher, and official. Some have argued that these passages were originally more general prescriptions on how a gentleman should dress and behave that were relabeled as descriptions of Confucius. Traditionally, Book X has been regarded as providing an intimate portrait of Confucius and has been read as a biographical sketch. The following passages provide a few examples.

> Confucius, at home in his native village, was simple and unassuming in manner, as though he did not trust himself to speak. But when in the ancestral temple or at Court he speaks readily, though always choosing his words with due caution. (*Lunyu* 10.1)
>
> When at court conversing with the officers of a lower grade, he is friendly, though straightforward; when conversing with officers of a higher grade, he is restrained but precise. When the ruler is present he is wary, but not cramped. (*Lunyu* 10.2)
>
> On entering the Palace Gate he seems to contract his body, as though there were not sufficient room to admit him. If he halts, it must never be in the middle of the gate, nor in going through does he ever tread on the threshold. (*Lunyu* 10.4)
>
> When fasting in preparation for sacrifice he must wear the Bright Robe, and it must be of linen. He must change his food and also the place where he commonly sits. He does not object to his rice being thoroughly cleaned, nor to his meat being finely minced. (*Lunyu* 10.7, 10.8)
>
> When sending a messenger to enquire after someone in another country, he bows himself twice while seeing the messenger off. (*Lunyu* 10.15)
>
> In bed he avoided lying in the posture of a corpse … On meeting anyone in deep mourning he must bow across the bar of his chariot. (*Lunyu* 10.24, 10.25)

Analects passages such as these made Confucius *the* model of courtliness and personal decorum for countless generations of Chinese officials.

By the 4th century BCE, Confucius was recognized as a unique figure, a sage who was ignored but should have been recognized and become a king. At the end of the 4th century, Mencius says of Confucius: “Ever since man came into this world, there has never been one greater than Confucius.” And in two passages Mencius implies that Confucius was one of the great sage kings who, according to his reckoning, arises every five hundred years. Confucius also figures prominently as the subject of anecdotes and the teacher of wisdom in the writing of Xunzi, a third century BCE follower of Confucius' teachings. Indeed chapters twenty-eight to thirty of the *Xunzi*, which some have argued were not the work of Xunzi but compilations by his disciples, look like an alternative, and considerably briefer, version of the *Analects*.

Confucius and his followers also inspired considerable criticism from other thinkers. The authors of the *Zhuangzi* took particular delight in parodying Confucius and the teachings conventionally associated with him. But Confucius' reputation was so great that even the *Zhuangzi* appropriates him to give voice to Daoist teachings.

2. Confucius' Social Philosophy

Confucius' teachings and his conversations and exchanges with his disciples are recorded in the *Lunyu* or *Analects*, a collection that probably achieved something like its present form around the second century BCE. While Confucius believes that people live their lives within parameters firmly established by Heaven—which, often, for him means both a purposeful Supreme Being as well as 'nature' and its fixed cycles and patterns—he argues that men are responsible for their actions and especially for their treatment of others. We can do little or nothing to alter our fated span of existence but we determine what we accomplish and what we are remembered for.

Confucius represented his teachings as lessons transmitted from antiquity. He claimed that he was "a transmitter and not a maker" and that all he did reflected his "reliance on and love for the ancients." (*Lunyu* 7.1) Confucius pointed especially to the precedents established during the height of the royal Zhou (roughly the first half of the first millennium, BCE). Such justifications for one's ideas may have already been conventional in Confucius' day. Certainly his claim that there were antique precedents for his ideology had a tremendous influence on subsequent thinkers many of whom imitated these gestures. But we should not regard the contents of the *Analects* as consisting of old ideas. Much of what Confucius taught appears to have been original to him and to have represented a radical departure from the ideas and practices of his day.

Confucius also claimed that he enjoyed a special and privileged relationship with Heaven and that, by the age of fifty, he had come to understand what Heaven had mandated for him and for mankind. (*Lunyu* 2.4). Confucius was also careful to instruct his followers that they should never neglect the offerings due Heaven. (*Lunyu* 3.13) Some scholars have seen a contradiction between Confucius' reverence for Heaven and what they believe to be his skepticism with regard to the existence of 'the spirits.' But the *Analects* passages that reveal Confucius's attitudes toward spiritual forces (*Lunyu* 3.12, 6.20, and 11.11) do not suggest that he was skeptical. Rather they show that Confucius revered and respected the spirits, thought that they should be worshipped with utmost sincerity, and taught that serving the spirits was a far more difficult and complicated matter than serving mere mortals.

Confucius' social philosophy largely revolves around the concept of *ren*, "compassion" or "loving others." Cultivating or practicing such concern for others involved deprecating oneself. This meant being sure to avoid artful speech or an ingratiating manner that would create a false impression and lead to self-aggrandizement. (*Lunyu* 1.3) Those who have cultivated *ren* are, on the contrary, "simple in manner and slow of speech." (*Lunyu* 13.27). For Confucius, such concern for others is demonstrated through the practice of forms of the Golden Rule: "What you do not wish for yourself, do not do to others;" "Since you yourself desire standing then help others achieve it, since you yourself desire success then help others attain it." (*Lunyu* 12.2, 6.30). He regards devotion to parents and older siblings as the most basic form of promoting the interests of others before one's own and teaches that such altruism can be accomplished only by those who have learned self-discipline.

Learning self-restraint involves studying and mastering *li*, the ritual forms and rules of propriety through

which one expresses respect for superiors and enacts his role in society in such a way that he himself is worthy of respect and admiration. A concern for propriety should inform everything that one says and does:

> Look at nothing in defiance of ritual, listen to nothing in defiance of ritual, speak of nothing in defiance or ritual, never stir hand or foot in defiance of ritual. (*Lunyu* 12.1)

Subjecting oneself to ritual does not, however, mean suppressing one's desires but instead learning how to reconcile one's own desires with the needs of one's family and community. Confucius and many of his followers teach that it is by experiencing desires that we learn the value of social strictures that make an ordered society possible (See *Lunyu* 2.4.). Nor does Confucius' emphasis on ritual mean that he was a punctilious ceremonialist who thought that the rites of worship and of social exchange had to be practiced correctly at all costs. Confucius taught, on the contrary, that if one did not possess a keen sense of the well-being and interests of others his ceremonial manners signified nothing. (*Lunyu* 3.3). Equally important was Confucius' insistence that the rites not be regarded as mere forms, but that they be practiced with complete devotion and sincerity. “He [i.e., Confucius] sacrificed to the dead as if they were present. He sacrificed to the spirits as if the spirits were present. The Master said, ‘I consider my not being present at the sacrifice as though there were no sacrifice.’” (*Lunyu* 3.12)

While ritual forms often have to do with the more narrow relations of family and clan, *ren*, however, is to be practiced broadly and informs one's interactions with all people. Confucius warns those in power that they should not oppress or take for granted even the lowliest of their subjects. “You may rob the Three Armies of their commander, but you cannot deprive the humblest peasant of his opinion.” (*Lunyu* 9.26) Confucius regards loving others as a calling and a mission for which one should be ready to die (*Lunyu* 15.9).

3. Confucius' Political Philosophy

Confucius' political philosophy is also rooted in his belief that a ruler should learn self-discipline, should govern his subjects by his own example, and should treat them with love and concern. “If the people be led by laws, and uniformity among them be sought by punishments, they will try to escape punishment and have no sense of shame. If they are led by virtue, and uniformity sought among them through the practice of ritual propriety, they will possess a sense of shame and come to you of their own accord.” (*Lunyu* 2.3; see also 13.6.) It seems apparent that in his own day, however, advocates of more legalistic methods were winning a large following among the ruling elite. Thus Confucius' warning about the ill consequences of promulgating law codes should not be interpreted as an attempt to prevent their adoption but instead as his lament that his ideas about the moral suasion of the ruler were not proving popular.

Most troubling to Confucius was his perception that the political institutions of his day had completely broken down. He attributed this collapse to the fact that those who wielded power as well as those who occupied subordinate positions did so by making claim to titles for which they were not worthy. When

asked by a ruler of the large state of Qi, Lu's neighbor on the Shandong peninsula, about the principles of good government, Confucius is reported to have replied: “Good government consists in the ruler being a ruler, the minister being a minister, the father being a father, and the son being a son.” (*Lunyu* 12.11) If I claim for myself a title and attempt to participate in the various hierarchical relationships to which I would be entitled by virtue of that title, then I should live up to the meaning of the title that I claim for myself. Confucius' analysis of the lack of connection between actualities and their names and the need to correct such circumstances is usually referred to as Confucius' theory of *zhengming*. Elsewhere in the *Analects*, Confucius says to his disciple Zilu that the first thing he would do in undertaking the administration of a state is *zhengming*. (*Lunyu* 13.3). Xunzi composed an entire essay entitled *Zhengming*. But for Xunzi the term referred to the proper use of language and how one should go about inventing new terms that were suitable to the age. For Confucius, *zhengming* does not seem to refer to the ‘rectification of names’ (this is the way the term is most often translated by scholars of the *Analects*), but instead to rectifying behavior of people so that it exactly corresponds to the language with which they identify and describe themselves. Confucius believed that this sort of rectification had to begin at the very top of the government, because it was at the top that the discrepancy between names and actualities had originated. If the ruler's behavior is rectified then the people beneath him will follow suit. In a conversation with Ji Kangzi (who had usurped power in Lu), Confucius advised: “If your desire is for good, the people will be good. The moral character of the ruler is the wind; the moral character of those beneath him is the grass. When the wind blows, the grass bends.” (*Lunyu* 12.19)

For Confucius, what characterized superior rulership was the possession of *de* or ‘virtue.’ Conceived of as a kind of moral power that allows one to win a following without recourse to physical force, such ‘virtue’ also enabled the ruler to maintain good order in his state without troubling himself and by relying on loyal and effective deputies. Confucius claimed that, “He who governs by means of his virtue is, to use an analogy, like the pole-star: it remains in its place while all the lesser stars do homage to it.” (*Lunyu* 2.1) The way to maintain and cultivate such royal ‘virtue’ was through the practice and enactment of *li* or ‘rituals’—the ceremonies that defined and punctuated the lives of the ancient Chinese aristocracy. These ceremonies encompassed: the sacrificial rites performed at ancestral temples to express humility and thankfulness; the ceremonies of enfeoffment, toasting, and gift exchange that bound together the aristocracy into a complex web of obligation and indebtedness; and the acts of politeness and decorum—such things as bowing and yielding—that identified their performers as gentlemen. In an influential study, Herbert Fingarette argues that the performance of these various ceremonies, when done correctly and sincerely, involves a ‘magical’ quality that underlies the efficacy of royal ‘virtue’ in accomplishing the aims of the ruler.

4. Confucius and Education

A hallmark of Confucius' thought is his emphasis on education and study. He disparages those who have faith in natural understanding or intuition and argues that the only real understanding of a subject comes from long and careful study. Study, for Confucius, means finding a good teacher and imitating his words and deeds. A good teacher is someone older who is familiar with the ways of the past and the practices of the ancients. (See *Lunyu* 7.22) While he sometimes warns against excessive reflection and meditation,

Confucius' position appears to be a middle course between studying and reflecting on what one has learned. “He who learns but does not think is lost. He who thinks but does not learn is in great danger.” (*Lunyu* 2.15) Confucius, himself, is credited by the tradition with having taught altogether three thousand students, though only seventy are said to have truly mastered the arts he cherished. Confucius is willing to teach anyone, whatever their social standing, as long as they are eager and tireless. He taught his students morality, proper speech, government, and the refined arts. While he also emphasizes the “Six Arts” -- ritual, music, archery, chariot-riding, calligraphy, and computation -- it is clear that he regards morality the most important subject. Confucius' pedagogical methods are striking. He never discourses at length on a subject. Instead he poses questions, cites passages from the classics, or uses apt analogies, and waits for his students to arrive at the right answers. “I only instruct the eager and enlighten the fervent. If I hold up one corner and a student cannot come back to me with the other three, I do not go on with the lesson.” (*Lunyu* 7.8).

Confucius' goal is to create gentlemen who carry themselves with grace, speak correctly, and demonstrate integrity in all things. His strong dislike of the sycophantic “petty men,” whose clever talk and pretentious manner win them an audience, is reflected in numerous *Lunyu* passages. Confucius finds himself in an age in which values are out of joint. Actions and behavior no longer correspond to the labels originally attached to them. “Rulers do not rule and subjects do not serve,” he observes. (*Lunyu* 12.11; cf. also 13.3) This means that words and titles no longer mean what they once did. Moral education is important to Confucius because it is the means by which one can rectify this situation and restore meaning to language and values to society. He believes that the most important lessons for obtaining such a moral education are to be found in the canonical *Book of Songs*, because many of its poems are both beautiful and good. Thus Confucius places the text first in his curriculum and frequently quotes and explains its lines of verse. For this reason, the *Lunyu* is also an important source for Confucius' understanding of the role poetry and art more generally play in the moral education of gentlemen as well as in the reformation of society.

Laozi

Confucianism, Daoism (Taoism), and Buddhism form the three main pillars of Chinese thought, keeping in mind that they are not monolithic but multifaceted traditions with complex internal divisions. Laozi (Lao-tzu, in "Wade-Giles" romanization) flourished during the sixth century B.C.E. and was the "founder" of Daoism, according to Chinese tradition. According to some modern scholars, however, Laozi is entirely legendary; there was never an historical Laozi. Daoism appears as a school of philosophy (*daojia*) as well as a religious tradition (*daojiao*); in the latter, Laozi is revered as a supreme deity. The name "Laozi" is best taken to mean "Old (*lao*) Master (*zi*)," and Laozi the ancient philosopher is said to have written a short book, which has come to be called simply the *Laozi*. When the *Laozi* was recognized as a "classic" (*jing*) -- that is, a work of such profound insight as to merit canonical status -- it acquired a more exalted and hermeneutically instructive title, the *Daodejing* (*Tao-te ching*), commonly translated as the "Classic of the Way and Virtue." Its influence on Chinese culture is pervasive, and it reaches beyond China. Next to the Bible, the *Daodejing* is the most translated work in world literature. It is concerned with the "Way" or Dao and how it finds expression in "virtue" (*de*), especially through what the text calls "naturalness" (*ziran*) and "nonaction" (*wuwei*). These concepts, however, are open to interpretation. While some see them as proof that the *Laozi* is a deeply "mystical" work, others emphasize their contribution to ethics and/or political philosophy. Interpreting the *Laozi* demands careful hermeneutic reconstruction, which requires both analytic rigor and an informed historical imagination.

The Laozi Story

The *Shiji* (Records of the Historian) by the Han dynasty court historian Sima Qian (ca. 145-86 B.C.E.) offers a "biography" of Laozi. Its reliability has been questioned, but it serves as a common point of

departure for scholarly debate. Laozi was a native of Chu, a southern state in the Zhou dynasty (see map and discussion in Loewe and Shaughnessy 1999 (*The Cambridge History of Ancient China*), 594, 597). His surname was Li; his given name was Er, and he was also called Dan. Laozi served as a keeper of archival records at the court of Zhou. Confucius (551-479 B.C.E.) had consulted him on the rites and praised him highly (*Shiji* 63). This establishes the traditional claim that Laozi was a senior contemporary of Confucius. A meeting or meetings between Confucius and Laozi, identified as "Lao Dan," is reported also in the *Zhuangzi* and other early Chinese sources.

"Laozi cultivated Dao and virtue," as Sima Qian goes on to relate, and "his learning was devoted to self-effacement and not having fame. He lived in Zhou for a long time; witnessing the decline of Zhou, he departed." When he reached the northwest border then separating China from the outside world, Yin Xi, the official in charge of the border pass, asked that he put his thoughts to writing. The result was a book consisting of some five thousand Chinese characters, divided into two parts, which discusses "the meaning of Dao and virtue." Thereafter, Laozi left; no one knew where he had gone. This completes the main part of Sima Qian's account. The remainder puts on record attempts to identify the legendary Laozi with certain known historical individuals and concludes with a list of Laozi's purported descendants (see W. T. Chan 1963 and D. C. Lau 1963 for an English translation).

Few scholars today would subscribe fully to the *Shiji* report. Indeed, according to William Boltz, it "contains virtually nothing that is demonstrably factual; we are left no choice but to acknowledge the likely fictional nature of the traditional Lao tzu [Laozi] figure" (1993, 270). Disagreements abound on every front, including the name Laozi itself. Although the majority takes "Laozi" to mean "Old Master," some scholars believe that "Lao" is a surname. The *Zhuangzi* and other early texts refer to "Lao Dan" consistently but not "Li Er." According to Fung Yu-lan, Sima Qian had "confused" the legendary Lao Dan with Li Er, who flourished during the Warring States period (480-221 B.C.E.) and was the "real" founder of the Daoist school (1983, 171). In an influential essay, A. C. Graham (1986) argues that the story of Laozi reflects a conflation of different legends. The earliest strand revolved around the meeting of Confucius with Lao Dan and was current by the fourth century B.C.E. During the first half of the third century, Lao Dan was recognized as a great thinker in his own right and as the founder of a distinct "Laoist" school of thought. It was not until the Han dynasty (206 B.C.E.-220 C.E.), when the teachings of Laozi, Zhuangzi, and others were seen to share certain insights centering on the concept of Dao, that they were classified together under the rubric of philosophical "Daoism" (*daojia*).

It is clear that by 100 B.C.E. if not earlier Laozi was already shrouded in legends, and that Sima Qian could only exercise his judgment as an historian to put together a report that made sense to him, based on the different and sometimes competing sources at his disposal. The fact that Lao Dan appears favorably in both Confucian and Daoist sources seems to argue against the likelihood that the figure was fabricated for polemical purposes. Lao Dan could have gathered around him a group of disciples, who out of respect would address him as "Laozi." Confucius had sought his advice presumably on mourning and funeral rites, given that the Confucian work *Liji* (Record of Rites) has Confucius citing Lao Dan four times specifically on these rites. Indeed, various dates have been proposed for the encounter -- for example, 501 B.C.E., following the account in the *Zhuangzi* (ch. 14) -- about which different versions circulated later among the elite during the Warring States period, when the Confucian and "Laoist" schools had secured

their place in the intellectual arena. Admittedly, this is conjecture; what is certain is that the identity of Laozi will continue to attract and divide scholarly opinion.

The story of Laozi occupies a cherished place in the Daoist tradition. It is important also because it raises certain hermeneutic expectations and affects the way in which the *Laozi* is read. If the work was written by a single author, one might expect, for example, a high degree of consistency in style and content. If the *Laozi* was a work of the sixth or fifth century B.C.E., one might interpret certain sayings in the light of what we know of the period. There is little consensus among scholars, however, on the date or authorship of the *Laozi*, as we shall see below.

With the arrival of the "Way of the Celestial Master" (*tianshidao*), the first organized religious Daoist establishment (*daojiao*) in the second century C.E., the story of Laozi gained an important hagiographic dimension. In the eyes of the faithful, the Dao is a divine reality, and Laozi is seen as the personification of the Dao. Lao Dan is but one manifestation of the divine Laozi, albeit a pivotal one because of the writing of the *Daodejing*, which in religious Daoism commands devotion as a foundational scripture that promises not only wisdom but also immortality and salvation to those who submit to its power. During the Tang dynasty (618-906 C.E.), the imperial Li family traced its ancestry to Laozi. Today, Laozi's "birthday" is celebrated in many parts of Asia on the fifteenth day of the second lunar month.

The influence of the *Laozi* on Chinese culture is both deep and far-reaching. One indication of its enduring appeal and hermeneutical openness is the large number of commentaries devoted to it throughout Chinese history -- some seven hundred, according to one count (W. T. Chan 1963, 77). The *Laozi* has inspired an intellectual movement known as *xuanxue*, "Learning of the Mysterious (Dao)" -- or "Neo-Daoism," as some scholars prefer, emphasizing its roots in classical Daoism -- that dominated the Chinese elite or high culture from the third to the sixth century C.E. Consequently, the *Laozi* played a significant role in informing not only philosophic thought but also the development of literature, calligraphy, painting, music, and other cultural traditions.

Imperial patronage enhanced the prestige of the *Laozi* and enlarged its scope of influence. In 731 C.E., the emperor Xuanzong decreed that all officials should keep a copy of the *Daodejing* at home and placed the classic on the list of texts to be examined for the civil service examinations. In religious Daoism, recitation of the *Daodejing* is a prescribed devotional practice and figures centrally in ritual performance. The *Daodejing* has been set to music from an early time. The term "*Laozi* learning" (*Laoxue*) has come to designate an important field of study; a recent effort that sketches the major landmarks in this development is *Zhongguo Laoxue shi* (A History of *Laozi* Learning in China) (Xiong Tieji, et al. 1995).

The influence of the *Laozi* extends beyond China, as Daoism reaches across Asia and in the modern period, the Western world. In Hong Kong, Taiwan, and among the Chinese in Southeast Asia, Daoism is a living tradition. Daoist beliefs and practices have contributed also to the formation of Korean and Japanese culture, although here the process of cultural transmission, assimilation, and transformation is highly complex, especially given the close interaction among Daoism, Buddhism, and indigenous traditions such as Shintō (see Fukui, et al. 1983, vol. 3). During the seventh century, the *Laozi* was translated into Sanskrit; in the eighteenth century a Latin translation was brought to England, after which

there has been a steady supply of translations into Western languages, yielding a handsome harvest of some 250 to date (LaFargue and Pas 1998, 277).

Laozi is an "axial" philosopher whose insight helps shape the course of human development, according to Karl Jaspers (1974). Memorable phrases from the *Laozi* such as "governing a large country is like cooking a small fish" (ch. 60) have found their way into Western political rhetoric. At the popular level, several comic versions of the *Laozi* reach out to a younger and wider readership (e.g., Tsai Chih Chung, et al. 1995). Some may have come to learn about the *Laozi* through such best-selling works as *The Tao of Physics* (Capra 1975) or *The Tao of Pooh* (Hoff 1982); and there is also *A Taoist Cookbook* (Saso 1994), which comes with "meditations" from the *Daodejing*. From nature lovers to management gurus, a growing audience is discovering that the *Laozi* has something to offer to them. The reception of the *Laozi* in modern Asia and the West falls outside the scope of this article; nevertheless, it is important to note that the *Laozi* should be regarded not only as a work of early Chinese philosophy but also in a larger context as a classic of world literature with keen contemporary relevance.

Date and Authorship of the *Laozi*

The date of composition refers to the time when the *Laozi* reached more or less its final form; it does not rule out later interpolations or corruptions. Generally, three positions can be distinguished. First, some scholars maintain that we should accept on the whole Sima Qian's account that the *Laozi* was written by Lao Dan in the sixth or early fifth century B.C.E. A second and more widely held view traces the *Laozi* to the fourth century, while a third argues for an even later date, not earlier than the mid-third century B.C.E. These are general indicators; the situation is more complex because the *Laozi* may turn out to be a composite work involving a long process of textual formation.

Both external and internal considerations play a role in determining the date of the *Laozi*. Quotations from the *Laozi* in other classical works are often cited as evidence. For example, if the *Mozi* quotes from the *Laozi*, and if the *Mozi* can be dated to the fifth century, then the *Laozi* would have been current by that time. There is in fact one such quotation preserved in the Song dynasty encyclopedic work, the *Taiping yulan* (322.5b), although it is not found in the present *Mozi*. Unless new archaeological evidence comes to light, the available external evidence can only confirm that parts of the current *Laozi* were available around 300 B.C.E. (see further discussion in the next section) and that the work became widely recognized by the middle of the third century, when it was quoted extensively in such works as the *Hanfeizi* and the "outer" and "miscellaneous" chapters of the *Zhuangzi*.

The language of the *Laozi* provides important clues. Much of the text is rhymed. Focusing on rhyme patterns, Liu Xiaogan (1994 and 1997) concludes that the poetic structure of the *Laozi* is closer to that of the *Shijing* (Classic of Poetry) than that of the later *Chuci* ("Songs of the South"; David Hawkes, trans. 1985). For this reason, the traditional view first articulated by Sima Qian should be upheld. Examining a wider range of linguistic evidence, William Baxter agrees that the *Laozi* should be dated earlier than the *Zhuangzi* and the *Chuci*, but he traces "the bulk of the *Lao-tzu* to the mid or early fourth century" (1998, 249). Both Liu and Baxter provide a concise analysis of the different theories of the date of the *Laozi*.

It is possible that the *Laozi* has "preserved" the ideas of Lao Dan. W. T. Chan, for example, believes that the text "embodied" the teachings of Laozi, although it was not written until the fourth century (1963, 74). According to A. C. Graham, the *Laozi* was ascribed to Lao Dan around 250 B.C.E. by the text's author or "publiciser," capitalizing on Lao Dan's reputation (1986, 119; also see Graham 1989). This leaves open the possibility that the book or parts of it existed before the middle of the third century. It also raises the question whether the *Laozi* was the work of a single author.

Conceivably, an editor or compiler, or a group or succession of them, could have brought together diverse sources. D. C. Lau, for example, is of the view that the *Laozi* is an "anthology" (1963, 14). According to Bruce Brooks and Taeko Brooks, the *Laozi* contains different layers of material spanning the period between 340 and 249 B.C.E. -- "its long timespan precludes a single author" (1998, 151). Indeed, Chad Hansen describes the "dominant current textual theory" of the *Daodejing* as one which "treats the text as an edited accumulation of fragments and bits drawn from a wide variety of sources … there was no single author, no Laozi" (1992, 201). In contrast, Rudolf Wagner (1984 and 2000) asserts that the *Laozi* has a consistent "rhetorical structure," characterized by an intricate "interlocking parallel style," which would cast doubt on the "anthology" thesis.

The idea of an oral tradition that preceded the writing of the *Laozi* has gained wide acceptance in recent years. However, it is not always clear what that entails. On the one hand, it could lend support to W. T. Chan's view cited above, that Lao Dan's disciples had kept alive the teachings of the master orally before some later student(s) committed them to writing. On the other hand, it could also mean that the redactor(s) or compiler(s) had access to disparate sayings originated from and circulated in different contexts. As Michael LaFargue emphasizes, oral tradition need not refer to the sayings of one person; it functions rather as a reservoir of "aphorisms," which were circulated among like-minded "Laoist" scholars and formed the basis of the *Daodejing* (1992, 197). This does not prejudge whether the final product contains sayings that were put together at random, or reflects a careful distillation on the part of the redactor(s) who arranged and/or altered the material at their disposal. LaFargue appears to favor the latter view, but other scholars (e.g., Lau 1963 and Mair 1990) see little sign of tight editorial control.

Much remains uncertain. It may be argued that date and authorship are immaterial to and may detract from interpretation. The "truth" of the *Laozi* is "timeless," according to this view, transcending historical and cultural specificities. Issues of provenance are important, however, if context has any role to play in the production of meaning. Polemics among different schools of thought, for example, were far more pronounced during the Warring States period than in the earlier "Spring and Autumn" period (770-481 B.C.E.). The Zhou government had been in decline; warfare among the "feudal" states intensified both in scale and frequency from the fourth century onward. As the political conditions deteriorated, philosophers and strategists vied to convince the rulers of the various states of their program to bring order to the land. At the same time, perhaps with the increased displacement and disillusionment of intellectuals, a stronger eremitic tradition also emerged. If the *Laozi* had originated from the fourth century, it might reflect some of these concerns. From this perspective, the origin of the *Laozi* is as much a hermeneutical issue as it is an historical one.

Textual Traditions

The discovery of two *Laozi* silk manuscripts at Mawangdui, near Changsha, Hunan province in 1973 marks an important milestone in modern *Laozi* research. The manuscripts, identified simply as "A" (*jia*) and "B" (*yi*), were found in a tomb that was sealed in 168 B.C.E. The texts themselves can be dated earlier, the "A" manuscript being the older of the two, copied in all likelihood before 195 B.C.E. (see Lau 1982, Boltz 1984, and Henricks 1989). Before this find, access to the *Laozi* was mainly through the received text of Wang Bi (226-249 C.E.) and Heshanggong, a legendary figure depicted as a teacher to the Han Emperor Wen (r. 179-157 B.C.E.). There are other manuscript versions, but by and large they play a secondary role in the history of the classic. A more recent archaeological find in Guodian, the so-called "Bamboo-slip *Laozi*," which predates the Mawangdui manuscripts, has rekindled debates on the origin and composition of the *Laozi*. But first a note on the title and structure of the *Daodejing*.

The *Laozi* did not acquire its canonical status until the Han dynasty. According to the *Shiji* (49.5b), the Empress Dowager Dou -- wife of Emperor Wen and mother of Emperor Jing (r. 156-141) -- was a dedicated student of the *Laozi*. Later sources add that it was Emperor Jing who established the text officially as a "classic" (*jing*). However, the title *Daodejing* appears not to have been widely used until later, toward the close of the Han era. The *Daodejing* is also referred to as the *Daode zhenjing* (True Classic of the Way and Virtue), the *Taishang xuanyuan Daodejing* (Classic of the Way and Virtue of the Highest Primordial Mystery), and less formally the "five-thousand character" text, on account of its approximate length. Most versions exceed five thousand characters by about five to ten percent, but it is interesting to note that numerological considerations later became an integral part of the history of the work. According to the seventh-century Daoist master Cheng Xuanying, Ge Xuan (fl. 200 C.E.) shortened the text that accompanied the Heshanggong commentary to fit the magical number of five thousand. This claim cannot be verified, but a number of *Laozi* manuscripts discovered at Dunhuang contain 4,999 characters.

The current *Daodejing* is divided into two parts (*pian*) and 81 chapters or sections (*zhang*). Part one, comprising chapters 1-37, has come to be known as the *Daojing*, while chapters 38-81 make up the *Dejing*. This is understood to be a thematic division -- chapter 1 begins with the word Dao, while chapter 38 begins with the phrase "superior virtue" -- although the concepts of Dao and virtue (*de*) feature in both parts. As a heuristic guide, some commentators have suggested that the *Daojing* is more "metaphysical," whereas the *Dejing* focuses more on sociopolitical issues.

In this context, it is easy to appreciate the tremendous interest occasioned by the discovery of the Mawangdui *Laozi* manuscripts. The two manuscripts contain all the chapters that are found in the current *Laozi*, although the chapters follow a different order in a few places. For example, in both manuscripts, the sections that appear as chapters 80 and 81 in the current *Laozi* come immediately after a section that corresponds with chapter 66 of the present text. Both manuscripts are similarly divided into two parts, but in contrast with the current version, in reverse order; i.e., both manuscripts begin with the *Dejing*, corresponding to chapter 38 of the received text. "Part one" of the "B" manuscript ends with the editorial notation, "Virtue, 3,041 [characters]," while the last line of "Part two" reads: "Dao, 2,426." Does this

mean that the classic should be renamed? One scholar, in fact, has adopted the title *Dedaojing* for his translation of the Mawangdui *Laozi* (Henricks 1989). Does this imply that the "original" *Laozi* gives priority to sociopolitical issues? This raises important questions for interpretation.

The division into 81 chapters reflects numerological interest and is associated particularly with the Heshanggong version, which also carries chapter titles. It was not universally accepted until much later, perhaps the Tang period, when the text was standardized under the patronage of Emperor Xuanzong (r. 712-755). Traditional sources report that some versions were divided into 64, 68, or 72 chapters; and some did not have chapter divisions (Henricks 1982). The Mawangdui "A" manuscript contains in some places a dot or "period" that appears to signal the beginning of a chapter. The earlier Guodian text is not divided into two parts, but in many places it employs a black square mark to indicate the end of a section. The sections so marked generally agree with the division in the present *Laozi*. Thus, although the 81-chapter formation may be relatively late, some attempt at chapter division seems evident from an early stage of the textual history of the *Daodejing*.

Until recently, the Mawangdui manuscripts have held the pride of place as the oldest extant manuscripts of the *Laozi*. In late 1993, the excavation of a tomb (identified as M1) in Guodian, Jingmen city, Hubei province, has yielded among other things some 800 bamboo slips, of which 730 are inscribed, containing over 13,000 characters. Some of these, amounting to about 2,000 characters, match the *Laozi* (see Allan and Williams 2000, and Henricks 2000). The tomb is located near the old capital of the state of Chu and is dated around 300 B.C.E. Robbers entered the tomb before it was excavated, although the extent of the damage is uncertain. The bamboo texts, written in a Chu script, have been transcribed into standard Chinese and published under the title *Guodian Chumu zhujian* (Beijing: Wenwu, 1998), which on the basis of the size and shape of the slips, calligraphy, and other factors divides the *Laozi* material into three groups. Group A contains thirty-nine bamboo slips, which correspond in whole or in part to the following chapters of the present text: 19, 66, 46, 30, 15, 64, 37, 63, 2, 32, 25, 5, 16, 64, 56, 57, 55, 44, 40 and 9. Groups B and C are smaller, with eighteen (chs. 59, 48, 20, 13, 41, 52, 45, 54) and fourteen slips (chs. 17, 18, 35, 31, 64), respectively.

On the whole, the Guodian "bamboo-slip *Laozi*" is consistent with the received text, although the placement or sequence of the chapters is different and there are numerous variant and/or archaic characters. Particularly, whereas chapter 19 of the current *Laozi* contains what appears to be a strong attack on Confucian ideals -- "Cut off benevolence (*ren*), discard rightness (*yi*)" -- the Guodian "A" text directs its readers to "cut off artificiality, discard deceit." This has been taken to suggest that in the course of its transmission, the *Laozi* has taken on a more "polemical" outlook. However, the Guodian "C" text indicates that *ren* and *yi* arose only after the "Great Dao" had gone into decline, which agrees with chapter 18 of the current *Laozi*.

It is not clear whether the Guodian bamboo manuscripts were copied from one source and were meant to be read as one text divided into three parts, whether they were "selections" from a longer original, or whether they were three different texts copied from different sources at different times. The "A" and "C" texts give two different versions of what is now part of chapter 64 of the *Laozi*, which may suggest different sources. One scholar at least has suggested a chronology to the making of the Guodian *Laozi*

bamboo slips, with the “A” group being the oldest of the three, copied around 400 B.C.E. (Ding 2000, 7-9). It is possible that the Guodian texts only furnished some of the textual “raw material” or “building blocks” that were used later to create the *Laozi* (Boltz 1999). In other words, they were independent writings and not versions of or excerpts from the *Laozi*, which in this scenario did not yet exist when the Guodian texts were made. Nevertheless, taking into account all the available evidence, it seems likely that a body or bodies of sayings attributed to Laozi gained currency during the fourth century B.C.E. They may have been derived from earlier, oral or written sources. By the mid-third century if not earlier, the *Laozi* probably reached more or less its final form and began to attract commentarial attention.

Two approaches to the making of the *Laozi* warrant consideration, for they bear directly on interpretation. A linear “evolutionary” model of textual formation would suggest that there was an original *Laozi*, by Lao Dan or of unknown authorship, and that the Guodian *Laozi* was close to this original text. Concerned with the decline of Zhou rule, the original *Laozi* addressed above all issues of governance. During the third century B.C.E., the *Laozi* had undergone substantial change and grown into a longer and more complex work, becoming in this process more polemical against the Confucian and other schools of thought, and acquiring new material of stronger metaphysical or cosmological interest. The Mawangdui manuscripts were based on this mature version of the *Laozi*; the original emphasis on politics, however, can still be detected in the placement of the *Dejing* before the *Daojing*. Later versions reversed this order and in so doing subsumed politics under a broader philosophical vision of Dao as the beginning and end of all beings.

The Guodian and Mawangdui manuscripts are certainly older than the received text of the *Laozi*, but this does not necessarily mean that they are therefore closer to the “original,” if there was an original. As opposed to a linear evolutionary model, it is conceivable that there were several overlapping collections of sayings attributed to Laozi from the start, each inhabiting a particular interpretive context, from which different versions of the *Laozi* were derived. Although some key chapters in the current *Laozi* that deal with the nature of Dao (e.g., chs. 1, 14) are not found in the Guodian corpus, the idea that the Dao is “born before heaven and earth,” for example, which is found in chapter 25 of the received text is already present. The critical claim that “being [*you*] is born of nonbeing [*wu*]” in chapter 40 also figures in the Guodian “A” text. This seems to argue against any suggestion that the *Laozi*, and for that matter ancient Chinese philosophical works in general were not interested or lacked the ability to engage in abstract philosophic thought, an assumption that sometimes appears to underlie evolutionary approaches to the development of Chinese philosophy.

The Guodian and Mawangdui finds are extremely valuable. They are syntactically clearer than the received text in some instances, thanks to the larger number of grammatical particles they employ. However, they cannot resolve all the controversies and uncertainties surrounding the *Laozi*. Perhaps the two approaches identified above are not mutually exclusive. Different written collections of Laozi sayings, leaving open the time and the way in which they were first formed, circulated during the fourth century. Overlapping in some cases and with varying emphases in others, they address both the nature of Dao and Daoist government. These were then developed in several ways -- e.g., some collections were combined; new sayings were added; and explanatory comments, illustrations, and elaboration on individual sayings were integrated into the text. The demand for textual uniformity rose when the *Laozi*

gained recognition, and consequently the different textual traditions eventually gave way to the received text of the *Laozi*.

As mentioned, the current *Laozi* on which most reprints, studies and translations are based is the version that comes down to us along with the commentaries by Wang Bi and Heshanggong. Three points need to be made in this regard. First, technically there are multiple versions of the Wang Bi and Heshanggong *Laozi* -- over thirty Heshanggong versions are extant -- but the differences are on the whole minor. Second, the Wang Bi and Heshanggong versions are not the same, but they are sufficiently similar to be classified as belonging to the same line of textual transmission. Third, the Wang Bi and Heshanggong versions that we see today have suffered change. Prior to the invention of printing, when each manuscript had to be copied by hand, editorial changes and scribal errors are to be expected. In particular, the *Laozi* text that now accompanies Wang Bi's commentary bears the imprint of later alteration, mainly under the influence of the Heshanggong version, and cannot be regarded as the *Laozi* that Wang Bi himself had seen and commented on. Boltz (1985) and Wagner (1989) have examined this question in some detail.

The "current" version refers to the "Sibu beiyao" and the "Sibu congkan" editions of the *Daodejing*. The former contains the Wang Bi version and commentary, together with a colophon by the Song scholar Chao Yuezhi (1059-1129), a second note by Xiong Ke (ca. 1111-1184)), and Lu Deming's (556-627) *Laozi yinyi* (Glosses on the Meaning and Pronunciation of the *Laozi*). It is a reproduction of the Qing dynasty "Wuying Palace" edition, which in turn is based on a Ming edition (see especially Hatano 1979). The Heshanggong version preserved in the Sibu congkan series is taken from the library of the famous bibliophile Qu Yong (fl. 1850). According to Qu's own catalogue, this is a Song version, published probably after the reign of the emperor Xiaozong (r. 1163-1189). Older extant versions include two incomplete Tang versions and fragments found in Dunhuang.

Besides the Guodian bamboo texts, the Mawangdui manuscripts, and the received text of Wang Bi and Heshanggong, there is an "ancient version" (*guben*) edited by the early Tang scholar Fu Yi (fl. 600). Reportedly, this version was recovered from a tomb in 574 C.E., whose occupant was a consort of the Chu general Xiang Yu (d. 202 B.C.E.), the rival of Liu Bang before the latter emerged victorious and founded the Han dynasty. A later redaction of the "ancient version" was made by Fan Yingyuan in the Song dynasty. There are some differences, but these two can be regarded as having stemmed from the same textual tradition.

Manuscript fragments discovered in the Dunhuang caves form another important source in *Laozi* research. Among them are several Heshanggong fragments (especially S. 477 and S. 3926 in the Stein collection, and P. 2639 in the Pelliot collection) and the important *Xiang'er Laozi* with commentary. Another Dunhuang manuscript that merits attention is the Suo Tan fragment, now at the University Art Museum, Princeton University, which contains the last thirty-one chapters of the *Daodejing* beginning with chapter 51 of the modern text. It is signed and dated at the end, bearing the name of the third-century scholar and diviner Suo Tan, who is said to have made the copy, written in ink on paper, in 270 C.E. According to Rao Zongyi (1955), the Suo Tan version belongs to the Heshanggong line of the *Laozi* text. A more recent study by William Boltz (1996) questions its third-century date and argues that the fragment in many instances also agrees with the Fu Yi "ancient version."

While manuscript versions inform textual criticism of the *Laozi*, stone inscriptions provide further collaborating support. Over twenty steles, mainly of Tang and Song origins, are available to textual critics, although some are in poor condition (Yan 1957). Students of the *Laozi* today can work with several Chinese and Japanese studies that make use of a large number of manuscript versions and stone inscriptions (notably Ma 1965, Jiang 1980, Zhu 1980, and Shima 1973). Boltz (1993) offers an excellent introduction to the manuscript traditions of the *Laozi*.

Commentaries

Commentaries to the *Laozi* offer an invaluable guide to interpretation and are important also for their own contributions to Chinese philosophy and religion. Two chapters in the *Hanfeizi* (chs. 21-22) are entitled "Explaining the *Laozi*" (*Jie Lao*) and "Illustrating the *Laozi*" (*Yu Lao*), which can be regarded as the earliest extant commentary to the classic. The "bibliographical" section of the *Hanshu* (History of the Former Han Dynasty) lists four commentaries to the *Laozi*, but they have not survived. Nevertheless, *Laozi* learning began to flourish from the Han period. The commentaries by Heshanggong, Yan Zun, Wang Bi, and the *Xiang'er* commentary will be introduced in what follows. Some mention will also be made of later developments in the history of the *Daodejing*. The late Isabelle Robinet has contributed an important pioneering study of the early *Laozi* commentaries (1977; see also Robinet 1998).

Traditionally, the Heshanggong commentary is regarded as a product of the early Han dynasty. The name Heshanggong means an old man who dwells by the side of the river, and some have identified the river in question to be the Yellow River. An expert on the *Laozi*, he caught the attention of Emperor Wen, who went personally to consult him. Heshanggong revealed to the emperor his true identity as a divine emissary sent by the "Supreme Lord of the Dao" -- i.e., the divine Laozi -- to teach him. The emperor proves a humble student, as the legend concludes, worthy of receiving the *Daodejing* with Heshanggong's commentary (Chan 1991a).

Recent Chinese studies generally place the commentary at the end of the Han period, although some Japanese scholars would date it to as late as the sixth century C.E. It is probably a second-century C.E. work and reflects the influence of the "Huang-Lao" (Yellow Emperor and Laozi) school, which flourished during the early Han dynasty (Chan 1991b). Called in early sources the *Laozi zhangju*, it belongs to the genre of *zhangju* literature, prevalent in Han times, which one may paraphrase as commentary by "chapter and sentence." Its language is simple; its imagination, down-to-earth. The Heshanggong commentary shares with other Han works the cosmological belief that the universe is constituted by *qi* or "vital energy." On this basis, interpreting the text in terms of yin-yang theory, the *Laozi* is seen to disclose not only the mystery of the origin of the universe but also the secret to personal well-being and sociopolitical order.

What the *Laozi* calls the "One," according to Heshanggong, refers to the purest and most potent form of *qi*-energy that brings forth and continues to nourish all beings. This is the meaning of *de*, the "virtue" or power with which the "ten thousand things" -- i.e., all beings -- have been endowed and without which

life would cease. The maintenance of “virtue,” which the commentary also describes as “guarding the One,” is thus crucial to self-cultivation. A careful diet, exercise, and some form of meditation are implied, but generally the commentary focuses on the diminishing of selfish desires. The government of the “sage” -- a term common to all schools of Chinese thought but which is given a distinctive Daoist meaning in the commentary -- rests on the same premise. Policies that are harmful to the people such as heavy taxation and severe punishment are to be avoided, but the most fundamental point remains that the ruler himself must cherish what the *Laozi* calls “emptiness” and “nonaction.” Disorder stems from the dominance of desire, which reflects the unruly presence of confused and agitated *qi*-energy. In this way, self-cultivation and government are shown to form an integral whole.

A second major commentary is the *Laozi zhigui* (The Essential Meaning of the *Laozi*) attributed to the Han dynasty scholar Yan Zun (fl. 83 B.C.E.-10 C.E.). Styled Junping, Yan’s surname was originally Zhuang; it was changed in later written records to the semantically similar Yan to comply with the legal restriction not to use the name Zhuang, which was the personal name of Emperor Ming (r. 57-75) of the Later Han dynasty. Yan Zun is well remembered in traditional sources as a recluse of great learning and integrity, a diviner of legendary ability, and an author of exceptional talent. The famous Han poet and philosopher Yang Xiong (53 B.C.E.-18 C.E.) studied under Yan and spoke glowingly of him.

The *Laozi zhigui*, as it now stands, is incomplete; only the commentary to the *Dejing*, chapters 38-81 of the current *Laozi*, remains. The best edition of the *Zhigui* is that contained in the *Daozang* (Daoist Canon 693, fasc. 375-377), which clearly indicates that the work had originally thirteen *juan* or books, the first six of which have been lost. Judging from the available evidence, it can be accepted as a Han product (Chan 1998b). The *Laozi* text that accompanies Yan Zun’s commentary agrees in many instances with the wording of the Mawangdui manuscripts.

Like Heshanggong, Yan Zun also subscribes to the yin-yang cosmological theory characteristic of Han thought. Unlike Heshanggong’s commentary, however, the *Zhigui* does not prescribe a program of nourishing one’s *qi*-energy or actively cultivating “long life.” This does not mean that it rejects the ideal of longevity. On the contrary, it recognizes that the Dao “lives forever and does not die” (8.9b), and that the man of Dao, correspondingly, “enjoys long life” (7.2a). Valuing one’s spirit and vital energy is important, but the *Zhigui* is concerned that self-cultivation must not violate the principle of “nonaction.” Any effort contrary to what the *Laozi* has termed “naturalness” (*ziran*) is counter-productive and doomed to failure.

The concept of *ziran* occupies a pivotal position in Yan Zun’s commentary. It describes the nature of the Dao and its manifestation in the world. It also points to an ethical ideal. The way in which natural phenomena operate reflects the workings of the Dao. The “sage” follows the Dao in that he, too, abides by naturalness. In practice this means attending to one’s heart-mind (*xin*) so that it will not be enslaved by desire. Significantly, the *Zhigui* suggests that just as the sage “responds” to the Dao in being simple and empty of desire, the common people would in turn respond to the sage and entrust the empire to him. In this way, the *Laozi* is seen to offer a comprehensive guide to order and harmony at all levels.

An early commentary that maximizes the religious import of the *Laozi* is the *Xiang’er Commentary*.

Although it is mentioned in catalogues of Daoist works, there was no real knowledge of it until a copy was discovered among the Dunhuang manuscripts (S. 6825 in the Stein collection). The manuscript copy, now housed in the British Library, was probably made around 500 C.E. The original text, disagreement among scholars notwithstanding, is generally traced to around 200 C.E. It is closely linked to the "Way of the Celestial Master" and has been ascribed to Zhang Daoling, the founder of the sect, or his grandson Zhang Lu, who was instrumental in ensuring the group's survival after the collapse of the Han dynasty. A detailed study and translation of the work in English is now available (Bokenkamp 1997).

The *Xiang'er* manuscript is unfortunately incomplete; only the first part has survived, beginning with the middle of chapter 3 and ending with chapter 37 in the current chapter division of the *Laozi*. It is not clear what the title, *Xiang'er*, means. Following Rao Zongyi and Ōfuchi Ninji, Stephen Bokenkamp suggests that it is best understood in the literal sense that the Dao "thinks (*xiang*) of you (*er*)" (1997, 61). This underscores the central thesis of the commentary, that devotion to the Dao in terms of self-cultivation and compliance with its precepts would assure boundless blessing in this life and beyond.

The *Xiang'er* commentary accepts without question the divine status of Laozi. While Yan Zun and Heshanggong direct their commentary primarily to those in a position to effect political change, the *Xiang'er* invites a larger audience to participate in the quest for the Dao, to achieve union with the Dao through spiritual and moral discipline. It is possible to attain the "life-span of an undefiled, godlike being" (*xianshou*). Nourishing one's vital *qi*-energy through meditation and other practices remains the key to attaining "long life" and ultimately to forming a spiritual body devoid of the blemishes of mundane existence (Rao 1991).

Spiritual discipline, however, is not sufficient; equally important is the accumulation of moral merit. Later Daoist sources refer to the "nine precepts" of the *Xiang'er*. There is also a longer set known as the "twenty-seven precepts" of the *Xiang'er*. These include general positive steps such as being tranquil and yielding, as well as specific injunctions against envy, killing, and other morally reprehensible acts. Likening the human body to the walls of a pond, the essential *qi*-energy to the water in it, and good deeds the source of the water, the *Xiang'er* commentary makes clear that deficiency in any one would lead to disastrous consequences (see Bokenkamp 1993).

Compared with the *Xiang'er*, Wang Bi's *Laozi* commentary could not be more different. There is no reference to "immortals"; no deified Laozi. The *Daodejing*, as Wang Bi sees it, is fundamentally not concerned with the art of "long life" but offers profound insights into the radical otherness of Dao as the source of being, and the practical implications that follow from it.

Styled Fusi, Wang Bi (226-249) was one of the acknowledged leaders of the movement of the "Learning of the Mysterious (Dao)" (*xuanxue*), a revival of Daoist philosophy that came into prominence during the Wei period (220-265) and dominated the Chinese intellectual scene well into the sixth century. The word *xuan* denotes literally a shade of dark red and is used in the *Laozi* (esp. ch. 1) to suggest the mystery or profundity of Dao. The movement has been identified, perhaps inappropriately, as "Neo-Daoism" in some Western sources. It signifies a broad philosophical front united in its attempt to discern the "true" meaning of Dao but not a homogeneous, sectarian school. Alarmed by what they saw as the decline of

Dao, influential intellectuals of the day initiated a radical reinterpretation of the classical heritage. They did not neglect the Confucian classics but drew inspiration especially from the *Yijing*, the *Laozi*, and the *Zhuangzi*, which were then referred to as the "Three Treatises on the Mysterious (Dao)" (*sanxuan*). Wang Bi, despite his short life, distinguished himself as a brilliant interpreter of the *Laozi* and the *Yijing* (see Chan 1991b and Wagner 2000).

According to Wang Bi, Dao is indeed the "beginning" of the "ten thousand things." Unlike Heshanggong or the *Xiang'er*, however, he did not pursue a cosmological or religious interpretation of the process of creation. Rather, Wang seems more concerned with what may be called the logic of creation. Dao constitutes the absolute "beginning" in that all beings have causes and conditions that derive logically from a necessary foundation. The ground of being, however, cannot be itself a being; otherwise, infinite regress would render the logic of the *Laozi* suspect. For this reason, the *Laozi* would only speak of Dao as "nonbeing" (*wu*).

The transcendence of Dao must not be compromised. To do justice to the *Laozi*, it is also important to show how the function of Dao translates into basic "principles" (*li*) governing the universe. The regularity of the seasons, the plenitude of nature, and other expressions of "heaven and earth" all attest to the presence of Dao. Human beings also conform to these principles, and so are "modeled" ultimately after Dao.

Wang Bi is often praised in later sources for having given the concept of "principle" its first extended philosophical treatment. In the realm of Dao, principles are characterized by "naturalness" (*ziran*) and "nonaction" (*wuwei*). Wang Bi defines *ziran* as "an expression of the ultimate." In this regard, attention has been drawn to Yan Zun's influence. Nonaction helps explain the practical meaning of naturalness. In ethical terms, Wang Bi takes nonaction to mean freedom from the dictates of desire. This defines not only the goal of self-cultivation but also that of government. Wang Bi's *Laozi* commentary has exerted a strong influence on modern interpretations of the *Laozi* in both Asia and the West. There are three English translations available (Lin 1977, Rump 1979, and Lynn 1999).

Among these four commentaries, Heshanggong's *Laozi zhangju* occupied the position of preeminence in traditional China, at least until the Song dynasty. For a long period, Wang Bi's work was relatively neglected. The authority of the Heshanggong commentary can be traced to its place in the Daoist religion, where it ranks second only to the *Daodejing* itself. Besides Heshanggong's work and the *Xiang'er*, there are two other commentaries entitled the *Laozi jiejie* (Sectional Explanation) and the *Laozi neijie* (Inner Explanation) closely associated with religious Daoism. Both have been ascribed to Yin Xi, the keeper of the pass who "persuaded" Laozi to write the *Daodejing* and who, according to Daoist hagiographic records, later studied under the divine Laozi and became an "immortal." These texts, however, only survive in citations (see Kusuyama 1979).

From the Tang period, one begins to find serious attempts to collect and classify the growing number of *Laozi* commentaries. An early pioneer is the eighth-century Daoist master Zhang Junxiang, who cited some thirty commentaries in his study of the *Daodejing* (Wang 1981). Du Guangting (850-933) provided a larger collection, involving some sixty commentaries (*Daode zhenjing guangshengyi*, *Daozang* 725).

According to Du, there were those who saw the *Laozi* as a political text, while others focused on spiritual self-cultivation. There were Buddhist interpreters (e.g., Kumārajīva and Sengzhao), and there were those who explained the "Twofold Mystery" (*chongxuan*). This latter represents an important development in the history of interpretation of the *Daodejing*.

The term "Twofold Mystery" comes from chapter 1 of the *Laozi*, where Dao is said to be the mystery of all mysteries (*xuan zhi you xuan*). As a school of Daoist learning, "Twofold Mystery" seizes this to be the key to understanding the *Laozi*. Daoist sources relate that the school goes back to the fourth-century master Sun Deng. Through Gu Huan (fifth century) and others, the school reached its height during the Tang period, represented by such thinkers as Cheng Xuanying and Li Rong in the seventh century. The school reflects the growing interaction between Daoist and Buddhist thought, particularly Mādhyamika philosophy. Unlike Wang Bi, it sees "nonbeing" as equally one-sided as being when applied to the transcendence of Dao. Nonbeing may highlight the profundity or mystery of Dao, but it does not yet reach the highest truth, which according to Cheng Xuanying can be called the "Dao of Middle Oneness" (Kohn 1992, 144). Like other polar opposites, the distinction between being and nonbeing must also be "forgotten" before one can achieve union with Dao.

The *Laozi* has been viewed in still other ways. For example, a Tang commentary by Wang Zhen, the *Daodejing lunbing yaoyishu* (*Daozang* 713; fasc. 417), presented to Emperor Xianzong (r. 806-820) in 809, sees the text as a treatise on military strategy (Rand 1979-80; see also Wang Ming 1984 and Mukai 1994). The diversity of interpretation is truly remarkable (see Robinet 1998 for a typological analysis). The *Daodejing* was given considerable imperial attention, with no fewer than eight emperors having composed or at least commissioned a commentary on the work. These include Emperor Wu and Emperor Jianwen of the Liang dynasty, Xuanzong of the Tang, Huizong of the Song, and Taizu of the Ming dynasty (see Liu Cunren 1969 for a discussion of the last three).

By the thirteenth century, students of the *Daodejing* were already blessed, as it were, with an embarrassment of riches, so much so that Du Daojian (1237-1318) could not but observe that the coming of the Dao to the world takes on a different form each time. That is to say, different commentators were shaped by the spirit of their age in their approach to the classic, so that it would be appropriate to speak of a "Han *Laozi*," "Tang *Laozi*," or "Song *Laozi*," each with its own agenda (*Xuanjing yuanzhi fahui*, DZ 703; fasc. 391).

Approaches to the *Laozi*

Is the *Laozi* a manual of self-cultivation and government? Is it a metaphysical treatise, or does it harbor deep mystical insights? Chapter 1 of the current *Laozi* begins with the famous words: "The Way that can be spoken of is not the constant Way." Chapter 10 speaks of nourishing one's "soul" and embracing the "One." Chapter 80 depicts the ideal polity as a small country with few inhabitants. The *Laozi* is a difficult text. Its language is often cryptic; the sense or reference of the many symbols it employs remains unclear, and there seems to be conceptual inconsistencies. For example, whereas chapter 2 refers to the "mutual production of being and nonbeing," chapter 40 declares, "Being originates in nonbeing" (Henricks, trans.

1989). Is it more meaningful to speak of the "worldviews" of the *Daodejing*, instead of a unified vision? If the *Laozi* were an "anthology" put together at random by different compilers over a long period of time, coherence need not be an issue. Traditionally, however, this was never a serious option. Most modern studies are equally concerned to disclose the "deeper" unity and meaning of the classic. While some seek to recover the "original" meaning of the *Laozi*, others celebrate its contemporary relevance. Consider, first of all, some of the main modern approaches to the *Daodejing* (cf. Hardy 1998).

One view is that the *Laozi* reflects a deep mythological consciousness at its core. The myth of "chaos," in particular, helps shape the Daoist understanding of the cosmos and the place of human beings in it (Girardot 1983). Chapter 25, for example, likens the Dao to an undifferentiated oneness. The myth of a great mother earth goddess may also have informed the worldview of the *Laozi* (Erkes 1935; Chen 1969), which explains its emphasis on nature and the feminine (Chen 1989). Chapter 6, for example, refers to the "spirit of the valley," which is also called the "mysterious female."

A second view is that the *Laozi* gives voice to a profound mysticism. According to Victor Mair (1990), it is indebted to Indian mysticism (see also Waley 1958). According to Benjamin Schwartz (1985), the mysticism of the *Daodejing* is *sui generis*, uniquely Chinese and has nothing to do with India. Indeed, as one scholar suggests, it is unlike other mystical writings in that ecstatic vision does not play a role in the ascent of the Daoist sage (Welch 1965, 60). According to another interpretation, however, there is every indication that ecstasy forms a part of the world of the *Laozi*, although it is difficult to gauge the "degree" of its mystical leanings (Kaltenmark 1969, 65). It is possible to combine the mystical and mythological approaches to yield a third view. Although the presence of ancient religious beliefs can still be detected, they have been raised to a "higher" mystical plane in the *Laozi* (e.g., Ching 1997).

A fourth view sees the *Laozi* mainly as a work of philosophy, which gives a metaphysical account of reality and insight into Daoist self-cultivation and government; but fundamentally it is not a work of mysticism (W. T. Chan 1963). The strong practical interest of the *Laozi* distinguishes it from any mystical doctrine that eschews worldly involvement. It is, in Creel's (1977) words, "purposive" and not "contemplative." Fifth, to many readers the *Laozi* offers essentially a philosophy of life. Remnants of an older religious thinking may have found their way into the text, but they have been transformed into a naturalistic philosophy. The emphasis on naturalness translates into a way of life characterized by simplicity, calmness, and freedom from the tyranny of desire (e.g., Liu Xiaogan 1997). Unlike the claim that the *Laozi* espouses a mystical or esoteric teaching directed at a restricted audience, this view tends to highlight its universal appeal and contemporary relevance.

A sixth and influential view is that the *Laozi* is above all concerned with realizing peace and sociopolitical order. It is an ethical and political masterpiece intended for the ruling class, with concrete strategic suggestions aimed at remedying the moral and political turmoil engulfing late Zhou China. Self-cultivation is important, but the ultimate goal extends beyond personal fulfillment (Lau 1963; LaFargue 1992). The *Laozi* criticizes the Confucian school not only for being ineffectual in restoring order but more damagingly as a culprit in worsening the ills of society at that time. The ideal seems to be a kind of "primitive" society, where people would dwell in harmony and contentment, not fettered by ambition or desire (Needham 1956).

This list is far from exhaustive; there are other views of the *Laozi*. Chad Hansen (1992), for example, focuses on the "anti-language" philosophy of the text. Different combinations are also possible. A. C. Graham, for example, emphasizes both the mystical and political elements, arguing that the *Laozi* was probably targeted at the ruler of a small state (1989, 234). The *Laozi* could be seen as encompassing all of the above -- such categories as the metaphysical, ethical, political, mystical, and religious form a unified whole in Daoist thinking and are deemed separate and distinct only in Western thought. Alternatively, coming back to the question of multiple authorship and coherence, it could be argued that the *Laozi* contains "layers" of material put together by different people at different times (Emerson 1995).

Is it fair to say that the *Laozi* is inherently "polysemic" (Robinet 1998), open to diverse interpretations? This concerns not only the difficulty of the *Laozi* but also the interplay between reader and text in any act of interpretation. Polysemy challenges the assertion that the "intended" meaning of the *Laozi* can be recovered fully. But it does not follow that context is unimportant, that parameters do not exist, or that there are no checks against particular interpretations. Questions of provenance, textual variants, as well as the entire tradition of commentaries and modern scholarship are important for this reason. Put differently, while hermeneutic reconstruction should be given full attention, it remains an open process. The following presents some of the main concepts and symbols in the *Laozi* based on the current text, focusing on the key conceptual cluster of Dao, *de* (virtue), *ziran* (naturalness), and *wuwei* (nonaction), in a way that highlights their philosophical significance and suggests a degree of coherence.

To begin with Dao, the etymology of the graph suggests a pathway, or heading in a certain direction along a path. Most commentators agree in translating *dao* as "way." As a verb, perhaps on account of the directionality involved, *dao* also conveys the sense of "speaking." Thus, the opening phrase of chapter 1, *dao ke dao*, literally "Dao that can be dao-ed," is often rendered, "The Way that can be spoken of." In most cases, the capitalized form -- "Way" or "Dao" -- is used, to distinguish it from other usages of the term.

The concept of *dao* figures centrally also in Confucian writings, and as mentioned some parts of the current *Laozi* represent a critique of the Confucian school (especially chs. 18 and 19). In general, whereas *dao* signifies a means to a higher end in other schools of Chinese philosophy, the *Laozi* sees it as an end in itself. This distinction is captured in the *Oxford English Dictionary* (online edition), which defines "Dao" as follows: "In Taoism, an absolute entity which is the source of the universe; the way in which this absolute entity functions." "In Confucianism and in extended uses," however, the term means "the way to be followed, the right conduct; doctrine or method."

The *Laozi* underscores both the ineffability and creative power of Dao. Chapter 1 states that the "constant" (*chang*, also translated as "eternal" -- e.g., W. T. Chan 1963) Dao cannot be described; it is "nameless." Chapter 14 brings out clearly that Dao transcends sensory perception; it has no shape or form. Nameless and formless, Dao can only be described as "dark" (*xuan*) or *wu*, literally "not having" any name, form, or other characteristics of things (see also chs. 21 and 32). Indeed, though suggestive, the term "Dao" itself is no more than a symbol -- as the *Laozi* makes clear, "I do not know its name; I style it Dao" (ch. 25; see also ch. 34). This suggests a sense of radical transcendence, which may explain why the

Laozi has been approached so often as a mystical text.

The concept of *wu* is difficult and has been translated variously as “nothing,” “nothingness,” or “nonbeing.” It marks not only the mystery of Dao but also its limitlessness or inexhaustibility (e.g., ch. 4). Names serve to delimit, to set boundaries; in contrast, Dao is without limits and therefore cannot be captured fully by language. This suggests a positive dimension to transcendence, which brings into view the creative power of Dao: “All things under heaven are born of being (*you*); being is born of *wu*” (ch. 40). What does this mean?

Elsewhere in the *Laozi*, Dao is said to be the “beginning” of all things (chs. 1, 25). Daoist creation involves a process of differentiation from unity to multiplicity: “Dao gives birth to One; One gives birth to Two; Two gives birth to Three; Three gives birth to the ten thousand things” (ch. 42). The text does not indicate tense or spell out what the numbers refer to -- is it saying that something called “the One” produced or produces “the Two”? The “nothingness” of Dao helps impose certain constraints on interpretation. Specifically, the idea of a creator god with attributes, like the “Lord on High” (Shangdi) in ancient Chinese religion, does not seem to fit with the emphasis on transcendence.

The dominant interpretation in traditional China is that Dao represents the source of the original, undifferentiated, essential *qi*-energy, the “One,” which in turn produces the yin and yang cosmic forces. While the yang energy rises to form heaven, yin solidifies to become earth. A further “blending” of the two generates a “harmonious” *qi*-energy that informs human beings. This is essentially the reading of the Heshanggong commentary. Although the *Laozi* may not have entertained a fully developed yin-yang cosmological theory, which took shape during the Han period, it does suggest at one point that natural phenomena are constituted by yin and yang (ch. 42). That which gave rise to the original *qi*-energy is indescribable. The *Laozi* calls it Dao, or perhaps more appropriately in this context, “the Dao,” with the definite article, to signal its presence as the source of the created order. In modern terms, minus the language of yin-yang cosmology, this translates into an understanding of the Dao as “an absolute entity which is the source of the universe.” Not being anything in particular, the Dao may be described as “nothing” (*wu*). However, *wu* does not mean “nothingness” or absence in the nihilistic sense, in view of the creative power of the Dao.

Alternatively, one could argue that Dao signifies a conceptually necessary ontological ground; it does not refer to any indescribable original substance or energy. “Beginning” is not a term of temporal reference but suggests ontological priority in the *Laozi*. The process of creation does proceed from unity to multiplicity, but the *Laozi* is only concerned to show that “two” would be impossible without the idea of “one.” The assertion “One gives birth to Two” affirms that duality presupposes unity; to render it as “The One gave birth to the Two” is to turn what is essentially a logical relation into a cosmological event.

As the source of being, Dao cannot be itself a being, no matter how powerful or perfect; otherwise, the problem of infinite regress cannot be overcome. For this reason, the *Laozi* makes use of the concept of *wu*, “nonbeing,” not to suggest a substance or something of which nothing can be said, but to signify the conceptual “otherness” and radical transcendence of the ground of being. This agrees with Wang Bi’s interpretation. If *wu* points to a necessary ontological foundation, the distinction between “Dao” and

"One" seems redundant. Commenting on chapter 42 of the *Laozi*, Wang Bi writes, "One can be said to be *wu*"; "One is the beginning of numbers and the ultimate of things" (commentary on ch. 39; see also Wang's commentary on the *Yijing*, trans. in Lynn 1994, 60). The concept of "One" and the concept of *wu* thus complement each other in disclosing different aspects of the logic of creation -- both unity and nonbeing are necessary for understanding the generation of beings.

Comparing the two interpretations, whereas the first, "cosmological" reading has to explain the sense in which the Dao can be said to be "nothing," the second emphasizes the centrality of *wu*, for which "Dao" is but one designation. Depending on the interpretation, *wu* may be translated as "nothing" or "nonbeing" accordingly. The metaphor of "Dao" is apt. It shows that all things are derived ultimately from an absolute "beginning," in either sense of the word, like the start of a pathway. It also suggests a direction to be followed, which brings out the ethical interest of the *Laozi*.

The *Daodejing* is concerned with both Dao and *de*. The graph *de* has also made it into the *Oxford*: "In Taoism, the essence of Tao inherent in all beings"; "in Confucianism and in extended use, moral virtue." *De* has been translated variously as virtue, potency, integrity, or power (for an etymological study, see Nivison 1978-79, and Hall and Ames 1987, 216). The Confucian usage is quite clear; virtue is a matter of moral character and presupposes self-cultivation. The *Laozi* seems to be suggesting a "higher" *de* against any moral achievement attained through repeated effort (e.g., ch. 38). The different translations aim at bringing out the uniquely Daoist sense of the term. Though ambiguous, "virtue" reminds us that the *Laozi* is giving new meaning to an established concept, as opposed to introducing a new concept not found in other schools of Chinese philosophy.

The marriage of Dao and *de* effectively bridges the gap between transcendence and immanence. Traditional commentaries beginning with the *Hanfeizi* often play on the homonymic relation between *de* (virtue) and another graph also pronounced *de*, which means to "acquire" or "obtain" something. *De* is thus what one has "obtained" from (the) Dao, a "latent power" by "virtue" of which any being becomes what it is (Waley 1958, 32). In this sense, the *Laozi* speaks of *de* as that which nourishes all beings (e.g., ch. 51).

Within these parameters, interpretations of *de* follow from the understanding of Dao and *wu*. On the one hand, for Heshanggong and other proponents of the cosmological view, what one has obtained from the Dao refers specifically to one's *qi*-endowment, which determines one's physical, intellectual, moral, and spiritual capacity. Read this way, the *Daodejing* should be translated as the "Classic of the Way and Its Virtue," given that *de* is understood to have emanated from the Dao. On the other hand, for Wang Bi and others who do not subscribe to a substantive view of Dao, *de* represents what is "genuine" or "authentic" (*zhen*) in human beings (e.g., see Wang Bi's commentary on *Laozi* chs. 3, 5, 16, 51). Because *wu* does not refer to any substance or cosmological power, what the *Laozi* means by *de*, the "virtue" that one has "obtained" from Dao, can only be understood as what is originally, naturally present in human beings. In either case, the concept of *de* emerges as a Daoist response to the question of human nature, which was one of the most contested issues in early Chinese philosophy. The two readings of the *Laozi*, despite their differences, agree that there is a prescriptive side to *de*. The empowerment enables a person to conform to the way in which Dao operates. When realized, "virtue" signifies the full embodiment of the Dao or the

flourishing of authenticity. As such, Dao points not only to the "beginning" but also through *de* to the "end" of all things.

The *Laozi* makes use of the concept of *ziran*, literally what is "self (*zi*) so (*ran*)," to describe the workings of Dao. As an abstract concept, it gives no specific information, except to say that Dao does not "model" after anything (ch. 25). However, since "heaven and earth" -- interpreted as nature in most modern studies -- are said to be born of Dao and come to be in virtue of their *de*, the *Laozi* is in effect saying that the ways of nature reflect the function of Dao. In a cosmological reading, this suggests an understanding of nature as governed by the operation of *qi*-energies in an ideal yin-yang system characterized by harmony and fecundity. As interpreted by Wang Bi, the *Laozi* means more generally that there are "principles" (*li*) inherent in nature. Human beings are, in turn, born of heaven and earth and so are "modeled" after them, either in terms of their *qi*-constitution or in the sense that they are governed also by the same basic principles. Usually translated as "naturalness" or "spontaneity," *ziran* thus builds on the concept of *de* in suggesting not only that the power of Dao finds expression in nature but also at the practical level a mode of being and way of action in accordance with the ways of nature.

Nature in the Daoist sense, it is important to note, need not exclude the spiritual and the social. The existence of gods and spirits was hardly questioned in early China. The *Laozi* makes clear that they, too, stem from Dao and form a part of the order of *ziran* (e.g., chs. 39, 60). Further, "nature" encompasses not only natural phenomena but also sociopolitical institutions. The king clearly occupies a central place in the realm of Dao (chs. 16, 25); the family also should be regarded as a "natural" institution (chs. 18, 54). As an ethical concept, *ziran* thus extends beyond the personal to the sociopolitical level. It is worth mentioning that *ziran* remains an influential idea today, especially in conceptions of romantic love and beauty in Chinese thinking.

The concept of *wuwei*, "nonaction," serves to explain naturalness in practice. "Nonaction" is awkward, and some translators prefer "non-assertive action" or "non-aggressive action," but it identifies *wuwei* as a technical term. It does not mean total inaction. Later Daoists may see a close connection between *wuwei* and techniques of spiritual cultivation -- the practice of "sitting in forgetfulness" (*zuowang*) discussed in the *Zhuangzi* is often mentioned in this regard. In the *Laozi*, the concept seems to be used more broadly as a contrast against any form of action characterized especially by self-serving desire (e.g., chs. 3, 37).

It is useful to recall the late Zhou context, where disorder marched on every front. The *Laozi*, one assumes, is not indifferent to the forces of disintegration tearing the country asunder, although the remedy it proposes is subject to interpretation. The problems of political decline are traced to excessive desire, a violation of *ziran*. Nonaction entails at the personal level simplicity and quietude, which naturally follow from having few desires. At the political level, the *Laozi* condemns aggressive measures such as war (ch. 30), cruel punishment (ch. 74), and heavy taxation (75), which reflect but the ruler's own desire for wealth and power. If the ruler could rid himself of desire, according to the *Laozi*, the world would be at peace of its own accord (chs. 37, 57).

In this sense, the *Laozi* describes the ideal sage-ruler as someone who understands and follows *ziran* (e.g., chs. 2, 17, 64). In this same sense, it also opposes the Confucian program of benevolent intervention,

which as the *Laozi* understands it, addresses at best the symptoms but not the root cause of the disease. The Confucian project is in fact symptomatic of the decline of the rule of Dao. Conscious efforts at cultivating moral virtues only accentuate the loss of natural goodness, which in its original state would have been entirely commonplace and would not have warranted distinction or special attention (chs. 18, 38). Worse, Confucian ethics assumes that learning and moral self-cultivation can bring about personal and social improvement. From the Daoist perspective, artificial effort to "improve" things or to correct the order of *ziran* only fuels a false sense of self that alienates human beings from their inherent "virtue."

The concept of nonaction is exceedingly rich. It brings into play a cutting discernment that value distinctions are ideological, that human striving and competitive strife spring from the same source. Nonaction entails also a critique of language and conventional knowledge, which to the Daoist sage has become impregnated with ideological contaminants. The use of paradoxes in the *Laozi* especially heightens this point. For example, the person of Dao is depicted as "witless" or "dumb," whereas people driven by desire appear intelligent and can scheme with cunning (ch. 20). The way of learning, as one would normally understand, "increases" the store of knowledge and adds value to goods and services; in contrast, questioning the very meaning of such "knowledge" and "value," the *Laozi* describes the pursuit of Dao as constantly "decreasing" or chipping away at the artifice built by desire (ch. 48). Driving home the same point, to cite but one more example, the *Laozi* states, "The highest virtue is not virtuous; therefore it has virtue" (ch. 38). In other words, those who fully realize "virtue" in the Daoist sense do not act in the way that men and women of conventional morality typically act or are expected to act. Paradoxes of this kind function as a powerful rhetorical device, which forces the reader, so to speak, to move out of his or her "comfort zone" and to take note of the proposed higher truth of Dao (see also, e.g., chs. 41, 45, 56). In this context, one can also understand some of the provocative statements in the *Laozi* telling the ruler, for example, to keep the people in a state of "ignorance" (ch. 65).

Some scholars would object that this interpretation misses the religious import of the *Daodejing*, while others would question whether it is too eager to defend the philosophical coherence of the classic. Perhaps the *Laozi* in chapter 65 of the current text did mean to tell the ruler literally to keep the people ignorant or stupid for better control, which as a piece of political advice is not that extraordinary. The remarks offered here take nonaction as central to the Daoist view of life, taking into account that the concept of *wuwei* does not only initiate a critique of value but also points to a higher mode of knowledge, action, and being.

At the critical level, the *Laozi* emphasizes the relativity of knowledge and value. Things appear big or small only in relation to other things; knowledge and ignorance are meaningful only in relation to each other. Good and bad, being and nonbeing, and other opposites should be understood in the same light (ch. 2). Distinctions as such are not necessarily problematic; for example, an object can be described as rare or difficult to find as compared with other objects. Problems arise, however, when objects that are rare are deemed more valuable than commonplace objects, when "big" is deemed superior to "small," or in general terms when distinctions become a basis for value discrimination. When certain things or features (e.g., precious stones, reputation, being slim, skin color) are regarded as "beautiful" or "worthy" -- i.e., desirable -- other things will inevitably be deemed "ugly" and "unworthy," with serious social, economic, and political consequences (ch. 3).

The recognition of the relativity of value does not end in a kind of ethical paralysis. The *Laozi* also does not appear to be advocating the obliteration of all distinctions, and by extension civilization as a whole, in a state of mystical oneness. For example, while there is some concern that technology may bring a false sense of progress, the antidote does not lie in a deliberate rejection of technology but rather in a life of natural simplicity and contentment that stems from having few desires (ch. 80). The critique of value demonstrates the way in which desire (*yu*), as distinguished from basic needs, perverts the heart-mind (*xin*) and colors our judgment and experience of reality. Nonaction contrasts sharply with the way people stereotypically act, with profit motives, calculated steps, expectations, longings, regrets, and other expressions of desire. In this way, the *Laozi* aims at making us understand why we do what we do. As a philosophical concept, *wuwei* intimates a mode of being that governs existential engagement at all levels, transforming the way in which we think, feel, and experience the world. It does not stipulate what one ought to do or ought not to do in particular cases -- terms such as quietude, emptiness, and simplicity favored by the *Laozi* describe a general ethical orientation rather than specific practices. Although in following *wuwei* there are things that a person of Dao naturally would not do (e.g., wage a war of aggression), philosophically *wuwei* is not about not doing certain things (thus, military engagement is not ruled out entirely -- e.g., see chs. 67, 68, 69) but suggests a reorientation of perception and value that ideally would bring an end to the dominance of desire and a return to the order of *ziran*.

Nonaction need not exclude meditation or other forms of spiritual practice; the point is rather that once realized, the transformative power of nonaction would ensure not only personal fulfillment but also sociopolitical order. This seems to weigh against a mystical reading of the *Laozi*, if mysticism is understood to entail a kind of personal union with the Dao transcending all political interests. The concept of “virtue,” whether interpreted in terms of authenticity or the purity and fullness of *qi*-energy, depicts a pristine natural and sociopolitical order in which naturalness and nonaction are the norm. The ethics of *wuwei* rests on this insight.

In this interpretive framework, a number of symbols which both delight and puzzle readers of the *Laozi* can be highlighted. Suggestive of its creativity and nurturance, Dao is likened to a mother (e.g., chs. 1, 25). This complements the paradigm of the feminine (e.g., chs. 6, 28), whose “virtue” is seen to yield fecundity and to find expression in yieldingness and non-contention. The infant (e.g., chs. 52, 55) serves as a fitting symbol on two counts. First, it brings out the relationship between Dao and world; second, the kind of innocence and wholesome spontaneity represented by the infant exemplifies the pristine fullness of *de* in the ideal Daoist world.

Natural symbols such as water (e.g., chs. 8, 78) further reinforce the sense of yielding and deep strength that characterizes nonaction. The low-lying and fertile valley (e.g., chs. 28, 39) accentuates both the creative fecundity of Dao and the gentle nurturance of its power. Carefully crafted and ornately decorated objects are treasured by the world, and as such can be used as a powerful symbol for it. In contrast, the utterly simple, unaffected, and seemingly valueless *pu*, a plain uncarved block of wood, brings into sharp relief the integrity of Daoist virtue and of the person who embodies it (e.g., chs. 28, 32). Finally, one may mention the notion of reversal (e.g., chs. 40, 65), which suggests not only the need to “return” to Dao, but also that the Daoist way of life would inevitably appear the very opposite of “normal” existence, and that

it involves a complete revaluation of values.

In sum, any interpretation of the current *Laozi* as a whole must take into account the way in which *wuwei* and *ziran* provide a guide to the good life. Specifically, two related issues need to be addressed. First, naturalness and nonaction are seen to reflect the function of the nameless and formless Dao. As such, ethical ideals are anchored in a non-empirical view of nature, which raises the concept of *de* to a higher level than "virtues" in the sense of moral attainments. The understanding of *de*, however, is dependent on that of Dao, which in turn hinges on the interpretation of *wu* as either original substance or nonbeing. Both readings are plausible. A cosmological reading is attractive also because it aligns the *Laozi* more closely with other early Chinese philosophical texts. An ontological reading emphasizing the conceptual nature of *wu* has the advantage of allowing the reader to draw out more readily the philosophical implications of the *Laozi*; it cannot be ruled out, especially if the only appeal is to a perceived evolutionary development in Chinese philosophy.

The second issue concerns the ethics of the *Laozi*. As mentioned, one main approach to the classic stresses its political orientation. In many chapters, the text seems to be addressing the ruler or the ruling elite, explaining to them the ideal government of the Daoist sage. This is not surprising given the Zhou context and given that the production of and access to written documents were generally the preserve of the ruling class in ancient China. But this need not restrict interpretation to politics in the narrow sense of statecraft or political strategies. In the light of the emphasis on *ziran* and *wuwei*, there is sufficient evidence that the *Laozi* views politics in a larger ethical context. The more difficult question is whether *wuwei* suggests a kind of moral relativism that would render any suggestion of a "higher" Daoist truth problematic.

If things are relative, they should be regarded as being of equal value. There are no objective criteria beyond relative utility for specific purposes in favoring, for example, what is "soft" over something "hard." Yet, as D. C. Lau (1963) has pointed out, at the ethical level the *Laozi* seems to favor the "lower" term -- for example, the "weakness" or "yieldingness" of water is singled out as a metaphor for ideal ethical conduct (ch. 78). We have suggested that the *Laozi* makes use of a critical mode to deconstruct conventional knowledge and value. The sense of moral relativity, however, gives way to a "higher" ethical mode based on insight into the order of *ziran* derived from an idealized view of nature. In this sense, the *Laozi* thus also makes use of such expressions as the "highest good" (ch. 8) and "highest virtue" (ch. 38). *Wuwei* ultimately derives its meaning from *wu*, which as an ethical orientation privileges "not having" over the constant strivings of the mundane world. This constitutes a powerful critique of a world given to the pursuit of wealth and power. More important, in being "empty," the person of Dao is said to be "full"; without desire, he or she is able to rediscover the riches of *ziran* and finds fulfillment. This invites reflection and continuing dialogue with the *Laozi*.

Other Internet Resources

- Taoism Information Page (maintained by Gene Thursby, Department of Religion, University of Florida)
  This forms a part of the World Wide Web Virtual Library and contains useful links to internet resources on Daoism and Chinese philosophy in general. The section on the *Daodejing* currently only lists a handful of English translations; but I expect the site to grow.
- Taoist Culture and Information Center

This site forms a part of the Daoist Culture Database and provides a simple introduction to Religious Daoism. It is the work of the Fung Ying Seen Koon, a major Daoist temple and a non-profit charitable organization active in community work in Hong Kong. Stephen Bokenkamp, a specialist in religious Daoism and professor at Indiana University is listed as a translator. Several well-known scholars from China are listed as advisors. The entries I have read are reliable, albeit very short.

- Taoist Studies in the World Wide Web, maintained by Fabrizio Pregadio.
  This is an excellent site, which also has links to other websites on Daoism.
- The China WWW Virtual Library. Internet Guide for China Studies, maintained at the Institute of Chinese Studies, Heidelberg University
  This is one of the most comprehensive websites on China Studies available today. Highly recommended.
- The Institute for Research in the Humanities, Kyoto University
  The "Jinbunken" has been building a large textual database for sinological research. The above link will take you to the English version page, but see also the following page for specialists.

Zhuangzi

'Zhuangzi' is the name of the second foundational text of the Daoist philosophical and religious tradition and the name of the putative author of this text, who early historical sources say flourished between about 350 and 300 B.C.E. As one of the two most popular Daoist texts in the Chinese tradition, the *Zhuangzi* has been the subject of more than sixty major East Asian commentaries since the third century C.E., some of which contain philosophically significant interpretations of the text. The most important of these are the commentary by Guo Xiang, which focuses on his understanding of Zhuangzi's philosophy of spontaneity, the commentary by Cheng Xuanying (ca. 620-670), a religious Daoist master with strong interests in emptiness theory, and commentaries by the following Sung and Ming dynasty literati scholars: Wang Pang (1042-76), Lin Xiyi (ca. 1200-73), Lo Miandao (ca. 1240-1300), and Jiao Hong (1541-1620). None of these has been fully translated into English and modern studies of them in any language are few, thus yielding a fertile field for future research. The existence of these commentaries demonstrates the great popularity of the *Zhuangzi* among Chinese literati who saw within it support for a withdrawal from a life of social and political service into a private life of reclusion and self-cultivation. If Confucianism came to stand for the foundational philosophy of this ethos of self-sacrifice, the Daoism of the *Zhuangzi* came to stand for its opposite, the escape from societal pressure into an individual path of freedom. While thus important to literati scholars, the work was also significant for Daoist religious practitioners who often took ideas and themes from it for their meditation practice, for example Sima Chengzhen's 'Treatise on Sitting and Forgetting' (ca. 660 C.E.) (Kohn 1987).

1. Provisos Concerning the Text

What we know of the philosophy of Zhuangzi comes primarily from this work but readers of translations of the received recension (Watson, Graham 1981, Mair 1998) should be aware of the following provisos.

First, the received recension contains thirty-three chapters and is not the original recension of the text. Guo Xiang (d. 312 C.E.) revised a fifty-two chapter original recension first listed in Imperial bibliographies circa 110 C.E. by removing material he thought was superstitious and generally not of philosophical interest to his literati sensibilities. He appended a philosophical commentary to the text that became famous and within four centuries his shorter and snappier expurgated recension became the only one known. This recension is traditionally divided into three sections: ‘Inner Chapters’ (1-7), ‘Outer Chapters’ (8-22), ‘Miscellaneous Chapters’ (23-33). This division is quite old and is likely to have been part of the original recension.

Second, the *Zhuangzi* text is clearly not the work of a single author and it is difficult to affix definitive authorship to any one person. At the very least there are five authorial voices best summarized by A.C. Graham: the historical Zhuangzi, later followers of Zhuangzi, followers influenced by the individualist thinker Yang Zhu, a ‘Primitivist’ Daoist author whose ideas are akin to those of the *Daode jing*, and the ‘Syncretist’ Daoist authors who Graham thinks compiled the first recension of the text (Graham 1979).

While it is true that many of the philosophical insights for which this work has become renowned in China and more recently in the West are found in the ‘Inner Chapters’ that have traditionally been ascribed to the historical Zhuangzi, we cannot fully understand these ideas and their significance without grasping how they relate to the entire thirty-three chapter text and the variety of ideas it contains. In this entry we shall accept the convention that a historical Zhuangzi authored most of the seven ‘Inner chapters’ while noting that there have been questions about this attribution that are not sufficient to overturn this traditional belief.

2. The Philosophy of the Inner Chapters

The *Zhuangzi* has become renowned for a series of original insights into human nature and the nature of the cosmos and many of these are found in the ‘Inner chapters.’ These insights are communicated in a variety of literary styles: didactic narratives, poetry, and very short prose essays. Like its famous companion, the *Daode jing*, the *Zhuangzi* is grounded in the complementary ideas of Dao and De. Dao, the ‘Way,’ is an ineffable monistic principle that infuses and guides the spontaneous processes of all phenomena; De, ‘Inner Power,’ is the realized manifestation of this Way within all phenomena. Despite sharing these foundational ideas, these two Daoist works discuss them very differently. The *Daode jing* often presents the characteristics and features of the Way in a direct discursive analysis (e.g., DDJ 1: "The Way that can be told of is not the Constant Way"). On the other hand, the *Zhuangzi* often approaches the Way indirectly through narratives and poetry. Witness the following rhetorical pointing to the Way:

> Heaven turns circles, yes!
> Earth sits firm, yes!
> Sun and Moon vie for a place, yes!
> Whose is the bow that shoots them?
> Whose is the net that holds them?
> Who is it sits with nothing to do and gives them the push that sends them away?
>
> (Graham 1981, p. 49; all following translations based on this work)

Or consider this rumination on epistemological relativity that ends with a vivid pointing to the Way:

> What is It is also Other, what is Other is also It. There they say, "this is true and that is false" from one point of view; here we say, "this is true and that is false" from another point of view. Are there really It and Other? Or really no It and Other. Where neither It nor Other finds its opposite is called the axis of the Way. When once the axis is found at the center of the circle there is no limit to responding with either, on the one hand no limit to what is it, on the other no limit to what is not.... (Graham, p. 53, modified)

This questioning of the certainty of knowledge from any normal human viewpoint is another hallmark of the 'Inner chapters,' as is the considerable degree of humor and irony with which the most profound insights into the cosmos are presented. This is true as well for Zhuangzi's presentation of Inner Power, which is done through narratives in which the most highly evolved human beings in terms of realizing this power are skilled butchers (see chapter 3) and criminals punished by mutilation (see chapter 5). This flaunting of societal prejudices is another way in which Zhuangzi challenges entrenched beliefs and demonstrates the breathtaking freedom from fixed conventions that has delighted readers for two millennia.

The Zhuangzi of the 'Inner Chapters' is also known for a thorough questioning of the canons, methods, and value of discursive reason and logic as practiced by contemporary thinkers in the traditions of the Mohists, Confucians, and Terminologists (*ming jia*). He is particularly critical of assumptions such as the one to one correspondence between words and the objects to which they refer that is an offshoot of the Confucian doctrine of the rectification of names. He demonstrates that naming is purely arbitrary and conventional and cannot be used to give any objective certainty about the world. Furthermore no matter how sophisticated the logic involved, no argument can establish objective truths because all knowing remains confined to the standpoint of the knower:

> Gaptooth put a question to Wang Ni: "Would you know something which all things agreed is true?" "How would I know that?" he replied. "Would you know what you did not know?" "How would I know that?" he replied again. "Then does no thing know anything?" "How would I know that?" he replied again. He then continued, "however, let me try to put this in words: how do I know that what I call knowing is not ignorance? How do I know

> that what I call ignorance is not knowing? ... Gibbons are sought by baboons as mates, elaphures like the company of deer, loaches play with fish. Maoqiang and Lady Li were beautiful in the eyes of men but when the fish saw them they plunged into the deep and when the birds saw them they flew away. Which of these four knows what is truly beautiful in the world? In my judgment, the principles of Humaneness and Rightness, the paths of True and False are inextricably confused: how could I know how to discriminate between them?" (Graham, p. 58, mod.)

Inspired by such ideas -- which are principally located in the second chapter of the *Zhuangzi*, entitled 'Discourse on Seeing all things as Equal' (*Qiwu lun*) -- Western comparative philosophers during the past two decades have taken a considerable interest in Zhuangzi and have engaged in spirited debate about whether he can be classified as a skeptic, a relativist, or a perspectivist. For example, Hansen argues that Zhuangzi espouses a 'perspectival relativism,' that shows that all discrimination and classification are relative to some changeable context of judgment (Hansen 1983). Relative judgments yield relative knowledge and so there are no standpoints from which anything can be known to be objectively true. Raphals finds that in this chapter Zhuangzi employs skeptical methods but not skeptical doctrines (Raphals 1996). This is because while denying the objectivity of common forms of knowledge ('small knowledge' in the text) Zhuangzi does acknowledge the existence of a greater form of knowledge ('illumination') and hence does not advance a 'true skepticism.' Ivanhoe argues that Zhuangzi was neither a sense skeptic nor an ethical skeptic, but that he definitely was both an epistemological skeptic about intellectual (in contrast to intuitive) knowledge and a language skeptic who doubted distinctions between right and wrong and the ability of words to express the Way (Ivanhoe 1993).

Yearley and Roth maintain that in addition to demonstrating elements of skepticism and relativism, that Zhuangzi was also a mystic. Yearley argues for an 'intraworldly mysticism' in which the goal is not union with some unchanging monistic principle but instead full participation in the natural world (Yearley 1983). Roth sees a 'bimodal' mystical experience in Zhuangzi that shows evidence for Stace's categories of introvertive and extrovertive mysticm (Roth 2000). He argues that the greater form of knowledge seen by Raphals and the acceptance of intuitive knowledge seen by Ivanhoe derive from a firm grounding in a meditative practice attested to in both the *Zhuangzi* and in many other sources of early Daoism. It is this practice that Roth calls 'inner cultivation' (Roth 1999). Simply put, it involves sitting quietly and systematically circulating the breath until mind and body become tranquil and the contents of consciousness gradually empty. Taken to its ultimate levels, this apophatic practice gives the adept a direct experience of the Way. In the 'Inner chapters' Zhuangzi talks of meditation in two famous narratives, one in which, ironically, his spokesman is the uncontemplative Confucius who teaches his favorite disciple Yan Hui about a technique he calls 'the fasting of the mind,' and the other in which the tables are turned and Yan teaches Confucius about 'sitting and forgetting.' In the former Confucius gives the following instructions:

> ...Unify your attention. Do not listen with the ears, listen with the mind. Do not listen with the mind but listen with the vital breath (*qi*). The ears only listen to sounds. The mind is only aware of its objects. But to focus on the vital breath is to be empty and await the arising of objects. It is only the Way that settles in emptiness. Emptiness is the fasting of

> the mind. (compare Graham, 68)

In the latter, Yan teaches Confucius:

> I let organs and members drop away, dismiss hearing and eyesight, part from the body and expel knowledge, and merge with the Great Pervader. This is what I mean by 'just sit and forget.' (Graham, 92 mod.)

Both passages attest to this apophatic inner cultivation practice in which all normal perceptions and thoughts are removed from consciousness and one eventually achieves union with the Way (the 'Great Pervader'). This yields what Stace has called an 'introvertive mystical experience' (Stace, 1960) Yet for Zhuangzi this experience, although profound, is not the ultimate goal. Speaking metaphorically, through Confucius, he says: 'to stop making footprints is easy but it is difficult to walk without touching the ground.'(comp. Graham 69). This type of ungrounded 'walking' has a significant epistemological dimension: a distinctive mode of cognition that Zhuangzi refers to as 'flowing' (*yin-shi*: literally 'to affirm by following along') in opposition to the 'fixed' mode of cognition (*wei-shi*: literally 'to affirm by forcing') that is bound to one individual perspective. Zhuangzi playfully contrasts these modes in the following famous story:

> A monkey keeper handing out nuts said, "Three every morning and four every evening." The monkeys were all in a rage. "All right," he said, "four every morning and three every evening." The monkeys were all delighted. Without anything being missed out either in name or in substance, their pleasure and anger were put to use: his too was a flowing cognition (*yin-shi*). This is why the sage smoothes things out with his flowing categories and stays at the point of rest on the Potter's Wheel of Heaven... (Graham, 54 mod.)

The monkeys exemplify the fixed mode of cognition in their rigid attachment to one and only one way of seeing the seven nuts. In this they symbolize all the contemporary intellectual traditions -- Confucians, Mohists, Terminologists -- that were arguing the truth of their individual positions against all others. The keeper is able to shift his conceptual categories to harmonize with those of the monkeys because he is free of attachment to any one particular way of seeing the nuts. His is a flowing cognition that adapts spontaneously to the situation, an 'illumined'(*ming*) awareness that exhibits an intuitive knowledge of how to act without even knowing that it is acting. Zhuangzi also calls this 'illuminating things with the light of heaven.' For him, 'heaven' stands for the spontaneous and intuitive aspect of our being that emerge when someone is grounded in the empty Way.

Zhuangzi further makes clear that abandonment of fixed cognition is concomitant with abandonment of attachment to the self: "Without an Other there is no Self; without Self, no choosing one thing rather than another." (Graham, 51) That is, if you lose the distinction between self and other then you lose the self and with it, any bias towards choosing one thing rather than another: "No thing is not 'Other;' no thing is not 'It.' If you treat yourself too as 'Other,' they do not appear. If you know of yourself you know of them" (Graham, 52). That is, in this situation It and Other do not appear because 'treating yourself as

Other' involves abandoning attachment to your self -- in other words having the same degree of attachment to Self as you do to Other. This lack of self-attachment is an essential characteristic of the free and spontaneously functioning consciousness of Zhuangzi's 'flowing cognition.' That this flowing mode, which is similar to Yearley's 'intraworldly mysticism' and which Roth asserts is a type of 'extrovertive mysticism,' develops from a union with the Way is articulated in the following passage from the 'Discourse on Seeing all things as Equal':

> If being 'so' is inherent in a thing ... then from no perspective would it not be 'so' ... . Therefore when a fixed cognition picks out a stalk from a pillar, a hag from beautiful Xishi, things however peculiar and incongruous, the Way pervades and unifies them (*tong wei yi*). As they divide they develop, as they develop they dissolve. All things whether developing or dissolving revert to being pervaded and unified. Only those who penetrate this know how to pervade and unify things. Fixed cognition they do not use, but find lodging places in daily life. It is in daily life that they make use of this perspective. It is in making use of this perspective that they pervade things. It is in pervading things that they attain it. And when they attain it they are almost there. 'Flowing cognition' comes to an end. It ends and when it does, that of which we do not know what is 'so' of it, we call 'the Way.' (Graham, 53-4 mod.)

Here Zhuangzi argues that there are no perspectives from which a thing is always 'so,' is always true. Common fixed cognition clearly differentiates things such as a stalk and a pillar and so on and it simultaneously makes preferences based on these perceptual distinctions. However it is only the Way that can pervade these things and unify them. That is, it is the one and only perspective from which all things are seen just as they are, without bias and without preference, from which 'all things are seen to be equal.' It is just this kind of seeing that is the essential defining characteristic of the 'great knowledge' or 'illumination' of the 'flowing cognition' that is developed by those rare sages who can penetrate through 'fixed cognition' and who can, as the Way does, 'pervade and unify' all things.

Using this ability, sages find temporary 'lodging-places,' i.e. viewpoints to which they are completely unattached within daily life. Yet even this 'flowing cognition' does eventually rest on something more profound: it comes to an end in the experience of union with the Way, described here as 'that of which we do not know what is so.' Knowing what is 'so' of something implies knowing its essential truth as an object of cognition and hence from the dualistic perspective of Self and Other. Yet the Way can never be known as an object: it can only be realized when the distinction between Self and Other dissolves in the introvertive mystical experience of uniting with the Way. Thus the extrovertive mystical experience of 'pervading and unifying' depends on the introvertive mystical experience of union referred to elsewhere in chapter six as 'merging with the Great Pervader' (*tong yu datong*). Once one temporarily loses the Self in this union and then returns to the everyday dualistic world one is no longer attached to Self. 'Flowing cognition' arises from this detachment.

Hence Zhuangzi's renowned questioning of logic and his skepticism and relativism are based upon this shift from fixed cognition to flowing cognition, from self-centered perspective to 'Way-centered' perspective. His epistemological critique is thus applied to knowledge derived from 'fixed cognition.'

‘Flowing cognition’ is exempted from this critique because it is this continually changing ‘Way-centered’ position from which the critique is made.

These complementary mystical experiences (‘merging with the Great Pervader’ and pervading and unifying using flowing cognition) are critical for the understanding of the other important philosophical themes for which the *Zhuangzi* is renowned. Naturalness and spontaneity arise directly from the ‘flowing cognition’ that is free of attachment to any one perspective. When sages act from this mode they can respond without self-consciousness to whatever situation in which they find themselves. Yet their spontaneity is grounded not in their individual separate selves but rather in the Way; we might say they have moved from a ‘self-centered’ perspective to a ‘Way-centered’ perspective. Thus living at the ‘axis of the Way’ they are able to blend the perspectives of Heaven and of human beings:

> The Realized Ones (*zhenren*) ... were one with what they liked and one with what they disliked, one when they were one and one when they were not one. When one, they were of Heaven’s faction and when not one they were of the human faction. Someone in whom neither Heaven nor human is victor over the other, this is what is meant by ‘Realized Ones.’ (Graham p. 85 mod.)

This freedom from attachment to any individual perspective that characterizes Zhuangzi’s ‘flowing cognition’ also leads to the freedom from fear of death and acceptance of it as part of the natural processes of life that is another of the famous themes of this work. In this narrative from chapter six a dying Daoist master addresses his friends:

> A child that has father and mother goes east and west, north and south, and has only their commands to obey. For humans the Yin and Yang are more than father and mother. As something other than me approaches, I am dying; if I were to refuse to listen it would be defiance on my part so how can I blame it? That Vast Clod of Soil (the Way) loaded me with a body, had me toiling through a life, eased me with old age, rests me with death. Therefore that I found it good to live is the very reason that I find it good to die. If today a master sword smith were smelting metal and the metal should jump up and say "I insist on being made into an Excalibur," the sword smith would surely think it metal with a curse on it. If now having once happened on the shape of a human being I were to say, "I’ll be a human, nothing but a human," that which fashions and transforms us would surely think me a baleful sort of person. Now if once and for all I think of heaven and earth as a vast foundry and the fashioner and transformer as a master smith, wherever I am going why should I object? ... (Graham 88-9 mod.)

3. The Philosophy of the Outer and Miscellaneous Chapters

3.1 The Disciples of Zhuangzi

With writings as profound and vibrant as these the historical Zhuangzi must have had quite a devoted group of followers and it is to them -- in all likelihood -- that we owe both the transmission of his ideas beyond his lifetime and at least six chapters of new material, much of it consisting of narratives written in the style of the ‘Inner chapters’ but generally not demonstrating the same creativity and rhetorical skill. Zhuangzi is a figure in about one quarter of these narratives, which were probably based on stories told by his immediate disciples and written down after his death. The chapters in this section, 17-22, are almost completely devoid of the philosophical essays, jottings, or even the diatribes we find in the first third of the book. Yet they contain some of the most famous narratives in the entire text.

The ‘autumn floods’ passage that dominates chapter 17 continues the theme of the relativity of different perspectives and the wholeness of the Way-centered perspective. This epistemological relativity is also the theme of the well-known dialogue between Zhuangzi and his Terminologist friend and debating rival Huishi while strolling over the Hao River Bridge found in this chapter. Chapter 18, ‘Complete Happiness,’ centers around the theme of the acceptance of death as part of the natural processes of Heaven and Earth and contains the famous narrative about Huishi’s visit to Zhuangzi after the death of the latter’s wife. Chapter 19 is perhaps the most famous of this grouping as it contains a series of ‘skill’ or ‘knack’ passages that feature heroes who can be seen as masters of the flowing mode of cognition emphasized in the ‘Inner chapters.’ These include the cicada-catching hunchback, the swimmer at Spinebridge Falls, and the bellstand carver who fasts for seven days before undertaking his task, thus recalling the mind-fasting advice Confucius gave to Yan Hui in chapter 4. Chapter 20 contains a group of narratives loosely organized around the theme of uselessness first presented in chapters 1 and 4. Only things that are not of use to anyone else are able to flourish and attain their full potential. Chapter 21 is filled with stories featuring exemplars of self-cultivation who have achieved the utmost inner power. The famous ‘knowledge wanders north’ narrative that begins chapter 22 contains insights on the limitations of the fixed mode of cognition to comprehend the Way. Filled with ideas from *Daode jing* and with references to breath meditation, it also contains the famous dialogue in which Zhuangzi details where the Way can be found.

Unlike the ‘Inner chapters’ that contain no references to Lao Tzu the man and to the text of the *Daode jing*, many of these chapters show an awareness of the *Daode jing* by their use of ideas and quotations from this text. This indicates that they were most likely written after this work began widely circulating in China after in about 260 B.C. E. To the extent that they recast material from the ‘Inner chapters’ in new narrative frameworks and frequently see it in light of ideas from the *Daode jing*, these chapters represent a unique blending of the two intellectually foundational sources of early Daoism.

The first group of the ‘Miscellaneous chapters,’ 23-27, and chapter 32 are much more heterogeneous in their content. They appear to contain more writings of the followers of Zhuangzi into which are interspersed passages from the other major authorial voices in the complete work, mostly the *Zhuangzi* of the ‘Inner chapters,’ the Primitivist, and, on occasion, the Syncretist. Given this lack of coherence, these ‘Miscellaneous chapters’ could contain material from some of the nineteen chapters that Guo Xiang deleted from the original recension of the text. In these chapters Zhuangzi’s followers continue their

engagement with their master's teachings from the 'Inner chapters' and attempt to integrate it with the teachings of the *Daode jing* now often attributed in narratives to Lao Dan, the shadowy fifth-century B.C.E. figure to whom this text began to be attributed after about 250 B.C.E. Perhaps the most interesting narrative in this grouping is the one that constitutes almost the entirety of chapter 23. In it the character Nanguo Chu goes on a quest for mystical knowledge and ends up being instructed by Lao Dan in a meditative practice that blends together ideas from the 'Inner chapters,' the *Daode jing*, and other sources of 'inner cultivation' such as *Guanzi*'s 'Inward Training' (*Neiye*) text (Roth 1999). This narrative, as well as several others in this group of chapters from the disciples of Zhuangzi, indicates that such meditation practices continued to be as central to the followers of Zhuangzi as they were to their teacher himself.

3.2 The Yangist Chapters

Chapters 28-31 of the received recension of the *Zhuangzi* were the first to be perceived as so different from the philosophy of the renowned 'Inner Chapters' that they were thought to be the work of an entirely different intellectual lineage. Indeed, these chapters are now seen to be similar in thought to five essays from the first two chapters of the compendium *Lüshi chunqiu* (240 B.C.E.) that consitute the only surviving works of the long-lost tradition of the philosopher Yang Zhu. Graham regards these *Zhuangzi* chapters themselves as Yangist while Liu Xiaogan links them to the 'Primitivist' material. Close examination reveals many common philosophical themes between these two groups of chapters but also reveals some key differences as well, as we shall see.

Yang Zhu was a fourth century B.C.E. contemporary of Mencius who engendered great antipathy in this Confucian thinker for suggesting that the basic tendencies of human nature were not what we might call 'other-regarding.' Mencius condemned Yang for being so egotistical as to be unwilling to sacrifice even a single hair in order to benefit the state (Mencius 7A26; Lau, p. 275). However if we are to base our understanding of Yang's doctrines on these two surviving sources, a much more complex and interesting picture of his philosophy emerges.

Yang Zhu may have been the first Chinese philosopher to speak of the concept of human nature (*xing*), and the parameters for all early Chinese discussions of this concept seem to have been established by Yang and Mencius. In brief, human nature is given to us by Heaven, the power responsible for everything in life beyond human control. The early Chinese conceived of two major aspects of our lives that fall into this category: *ming* (fate, destiny), the various things that occur as the result of agencies other than ourselves and *xing* (nature), the sum total of our genetic inheritance both as a species and as unique individual members of it. According to Graham and Ames, human nature in early China is conceived as totally dynamic, in contrast to the implicit static basis of human nature we find in the West (Graham 1967, Ames 1991). The Chinese concept of human nature can be best understood as referring to the spontaneous tendencies that an individual has from birth that govern its development as a particular individual within a species and which also act as forces in its daily life. Thus this concept implies both the potential to develop in a certain way and the spontaneous tendencies for this development and for certain characteristic types of activities. We might call the former tendencies 'genetic' and the latter

tendencies ‘instinctive.’ Mencius argued that the essential goodness of human nature rested in the spontaneous tendencies to act selflessly and respectfully, tendencies that persist throughout the lifetime of an individual even if left undeveloped. In other words, it is a basic human instinct to act selflessly. For him the purpose of self-cultivation was to nurture these spontaneous instinctive tendencies until they blossomed into complete ethical virtues. The Yangist challenge to the social emphasis of the Confucians consisted in the primacy they placed on the maintenance of the individual life and the fact that they supported this mode of living with the theory that to act in this fashion was to nourish the nature that we receive from Heaven. Since Confucians placed a high value on the sanctions and approvals of Heaven, it was incumbent upon them to argue for a different vision of human nature.

The single most basic of the spontaneous tendencies of human nature for the Yangists is longevity. They argued that human beings tend to live long if they keep themselves from being disturbed by the ‘external things’ of this world such as fame and profit. The second important aspect of human nature is the desire of the five sense faculties (eye, ear, nose, tongue, skin) for sense-objects. It is the senses’ desire for their objects that in a fundamental way helps to maintain the health and the development of the organism, thus enabling it to realize its inherent tendency for longevity. However the senses themselves need to be regulated and limited to only the ‘suitable’ amount of stimulation. Over-stimulation causes the senses to be impaired and eventually damaged. Thus there is a suitable amount of stimulation that is conducive to the health and development of the human organism and that suitable amount must be determined by Sages; the senses on their own do not have the ability to do this. Self-cultivation for the Yangists therefore consists of nourishing one’s inherent nature by strictly limiting sense stimulation to the appropriate degree needed to maintain health and vitality. One of their principal practices was to prevent the loss of one’s finite supply of *jing* (essential vital energy), which is lost due to over-stimulation of the senses. The Yangists shared an understanding of how the human organism functioned with the thinkers of the ‘inner cultivation’ tradition and with early Chinese medical philosophers and practitioners who envisioned a body-mind complex made up of various systems of *qi* (vital energy). It is also worth noting that, in keeping with their dynamic concept of human nature, the Yangists included the senses’ desire for sense objects in it and not the senses themselves, which would imply a static basis.

Implicit in the Yangist authors’ inclusion of longevity within human nature is the understanding that the various systems of vital energy that constitute a living organism tend to function harmoniously if left unimpaired. Nurturing the nature by limiting the senses to their appropriate degree of stimulation and avoiding activities that would damage the organism involve assisting in this inherent tendency for harmony. Human beings, as well as all things in the world, cohere and function if undamaged; they do not fall apart. The individual microcosm, just as the universal macrocosm, is not random and chaotic. It functions according to certain basic laws and patterns. To understand them, and to live according to them, to understand the spontaneous tendencies of human nature and to nurture them by conscious choice, is the basis of the Yangist method of self-cultivation.

Given their concept of human nature and their resultant ideas about self-cultivation, and their emphasis on avoiding placing oneself in jeopardy for fame and profit, it is not surprising that the Yangists do not proffer an elaborate social and political philosophy. "The most genuine in the Way is for supporting one’s own person ..." reads *Zhuangzi* 28, (‘Yielding the Throne’), "its left-overs are for running a state,

its discards are for ruling the empire. Seen from this viewpoint, the achievements of emperors and kings are the left-over deeds of the sage, they are not the means by which he keeps his person whole and nurtures life." (Graham, p. 227) In chapter 29 of *Zhuangzi* ('Robber Zhi') we find the dictum: 'If you can't look after yourself, you can't look after others.' (Graham, p. 238) In the 'Valuing Life' essay of the *Lüshi chunqiu*, we read, "only those who would not impair their natures are able to be entrusted with ruling the empire" (Riegel/Knoblock p. 80, mod.). A very similar idea is expressed in chapter 13 of the *Daode jing*: "Hence he who values his body more than dominion over the empire can be entrusted with the empire." (Lau 1982, p. 19) This seems to imply that such a ruler would treat others as carefully as he treats himself, although the ethical implications of putting oneself first for government are never worked out in the surviving Yangist documents.

What we do find in the Yangist-oriented chapters of the *Zhuangzi* are many stories in which the concern for not impairing one's nature leads people to either resign the throne, or to never accept public office. The life of the recluse is commended, but the authors are sharply critical of those moralists who would rather kill themselves than participate in government. The Yangist political philosophy is clear: do not seek after fame, wealth, and power, all of which are far beyond your essential needs. Never do anything to impair your inherent tendency to live a long and fulfilling life. To know this is to differentiate the important from the unimportant, to understand, in the words of the 'Giving Weight to the Self' essay in Book 1 of the *Lüshi chunqiu,* 'the essentials of our nature and destiny' (*xingming zhi qing*) Riegel/Knoblock, pp. 67-68 mod.) Only those who can do this are truly fit to govern.

Structurally, the four Yangist-oriented chapters of the *Zhuangzi* are each unique. Chapter 28 is a collection of eighteen narratives, ten of which are found in slightly varying forms dispersed throughout the *Lüshi chunqiu*. Chapter 29 contains only three narratives, including the famous long one in which Robber Zhi berates Confucius, accusing him of practicing a way that 'is a crazy obsession, a thing of deception, trickery, vanity, and falsehood [that] will not serve to keep the genuine in us intact...'(Graham, 239). Chapter 30 consists of one short narrative in which Zhuangzi demonstrates the inferiority of sword fighting. Chapter 31 contains a dialogue between Confucius and a hermit known as the 'Old Fisherman,' who teaches him that the art of self-cultivation lies in 'guarding the genuine within you.' He defines 'the genuine' as the spontaneous expression of emotions. This concept of 'guarding the genuine' resonates most closely with the central theme of the rest of the text, that of cultivating the flowing mode of cognition. However, there are virtually no mystical elements in these Yangist chapters and this both distinguishes them from the remainder of the *Zhuangzi* and prevents them from being classified as 'Daoist.' Yet in their discussion of human nature, their attacks on the Confucians and their praise of ancient primitive Utopias, they so much echo ideas from the Primitivist chapters that scholars such as Liu Xiaogan conclude they belong to the same intellectual tradition.

3.3 The Primitivist Chapters

There are three chapters (8-10) and half of a fourth (11) that present such a consistent literary structure, technical terminology, and written style that Graham maintains them to be the work of a single author, one who espouses a viewpoint similar to that found in the *Daode jing* differing principally in that it is not

addressed to the ruler. To these Roth would add chapter 16, ‘Menders of Nature,’ when modified by the removal of a short Syncretist gloss that has previously prevented scholars from linking it with the others (Roth 2002). Because of their advocacy of a return to a government and social organization similar to that found in primitive tribal Utopias, Graham has labeled these chapters as ‘Primitivist.’ While similar in their Utopian vision, critique of the Confucians, and their focus on a theory of human nature to the Yangist-oriented chapters, they depart from them in containing key elements of mystical philosophy such as a cosmology of the Way and Inner power and reference to methods of ‘inner cultivation.’ In addition, rather than totally eschewing political philosophy, they advocate a government by Non-action similar to that found in the *Daode jing*. These chapters are important because they contain the first discussion of human nature in the entire Daoist tradition and they seem to define it by building on the Yangist conceptions of it.

Like the Yangists, the Primitivists commend, and, in ‘Menders of Nature,’ even defend the life of the recluse who withdraws from political involvement. Both label their Utopias ages ‘when Inner Power was at its utmost,’ and Robber Zhi, the Yangist critic of Confucius in chapter 29 is a somewhat sympathetic, if ironic, figure in the chapter 10, ‘Rifling Trunks.’ Like the Yangists, the Primitivists recognize the two complementary aspects of human nature, both the ‘genetic’ tendencies that determine the characteristic course of development of members of a given species and the spontaneous ‘instinctive’ tendencies that arise within the daily activity of individual members of said species. Both agree that this nature is not the actual physical attributes (such as horses hooves for the Primitivist, or the sense organs for both), but rather the tendencies for them to develop in a species-characteristic way and to function spontaneously without additional help. Both believe that these tendencies can be nurtured or can be interfered with, and both maintain that to avoid interfering with them is to understand the ‘essentials of our nature and destiny,’ which is mentioned once in the Yangist-oriented chapters and eight times in the Primitivist chapters. If we take the word ‘destiny’ to refer to one’s allotted years, we might argue that the Primitivists as well, at least tacitly accept longevity as an attribute of human nature. To this extent there is a Yangist basis for the Taoist Primitivists. However there are also substantial differences.

As we have seen, the Yangist inclusion of longevity in human nature contains an implicit understanding that the physiological systems that constitute the individual organism tend to function spontaneously and harmoniously. This understanding is made explicit by the Primitivists; indeed, the inherent spontaneous activity of the individual becomes one of the cornerstones of their unique concept of human nature. It is so important that it replaces the Yangist longevity as the overall goal of self-cultivation and the raison d’etre for human existence. In contrast to the Yangists, the Primitivists maintain that the natural tendency of the senses is not merely to desire sense-objects, but, rather, to perceive them clearly. When the senses are allowed to operate unimpeded by the culturally established normative categories (the Five Tastes, the Five Colors, the Five Tones, and so on) and they hence operate spontaneously, they will clearly grasp their objects. These cultural norms insert an element of bias and inclination into the perceptual process thereby leading perception astray. In an analogous manner, Confucian ethical norms of humaneness and rightness, inject ‘inclinations and aversions’ into the spontaneous functioning of the mind and disrupt its inherent tendency to operate in an unbiased and harmonious fashion. As the author of ‘Menders of Nature’ succinctly states: "If someone else lays down the direction for you you blinker your Inner Power." (Graham, p. 171, mod.). For the Primitivists, Inner Power is simply allowing the spontaneous

tendencies of one’s nature to operate without interference. It is our nature for them to do so; culture, with the self-consciousness it forces on human beings, disrupts and damages it. As we read in chapter 8, ‘Webbed Toes,’:

> To depend on the carpenter’s curve and line, compasses, L-square, to straighten you out, is to pare away your nature; to depend on cords, knots, glue, lacquer, to hold you together, is to violate your Inner Power; and to bow and crouch for Rituals and Music, and smirk and simper over Humaneness and Rightness, in order to soothe the hearts of the world, is to lose the constant in you. There is such as thing as constancy in the world.... Thus everything in the world springs into life without knowing how it is born, attains unthinkingly without knowing how it attains. Hence the present is no different from the past, and nothing can be missing from its place. (Graham, p. 201, mod.)

That which is the constant in the world for the Primitivists, is its tendency for spontaneous and harmonious activity. In human beings this is inherent in their very natures. The author of ‘Menders of Nature,’ in harkening back to an earlier time when people "lived in the midst of the merged and featureless, and found tranquility and mildness with those of their own time..." says, "At this era no one took any (deliberate) action and things were constantly so of themselves." (Graham, p. 171, mod.) This reiterates two important ideas in the *Daode jing*, Non-action (*wu-wei*) and ‘so-ness’ or spontaneity (*ziran*). The former refers to acting without egotism and self-consciousness. The latter refers to allowing things to be just as they naturally are. This theme of the constancy in human nature is central to the Primitivist vision of an ideal society. It is fully described in chapter 9, ‘Horses Hooves:’

> The people have a nature that is constant:
> By their weaving clothed, by their ploughing fed-
> This is called ‘sharing Inner Power’.
> In oneness and without faction:
> The name for it is ‘free as the air’.
>
> Therefore, in the age when Inner Power was at its utmost....
> people lived in sameness with birds and beasts, side by side as fellow clansmen with the myriad creatures; how would they know a gentleman from a knave?
>
> In sameness, knowing nothing!
> Not parted from their Inner Power.
> In sameness, desiring nothing!-
> Call it "the simple and unhewn."
>
> In the simple and unhewn the nature of the people is found. (Graham pp. 204-5, mod.)

The ‘simple’ (*so*) and the ‘unhewn’ (*pu*) are important ideas in the *Daode jing* wherein to be ‘simple’ mean to be unselfish (DDJ 19) and to be ‘unhewn’ means to be without desires (DDJ 19, 38) The

definitions in 'Horses Hooves' are similar, the only difference being that to be simple means 'knowing nothing.' Both words suggest a state of mind totally devoid of self-consciousness, a state of mind in which people act spontaneously and without self-reflection. It is a state of mind that is reminiscent of the 'flowing cognition' of the 'Inner chapters.' For the Primitivists, it is human nature to attain this state of mind when people are left on their own, when the institutions of culture do not interfere with their spontaneous tendencies. To attain this state is to realize your Inner Power. Throughout their writings the Primitivists harken back to an earlier Utopian age when people lived in selfless harmony with one another and with all things in the world and when the Way and Inner Power were fully realized. The Confucian sage-rulers, who established cultural norms and thereby forced people to think about how to attain them, destroyed this harmony and made it much more difficult for people to attain the 'simple and unhewn' state of mind. However by doing away with the sages and their cultural norms we can return to a primitive Utopia: 'Utterly demolish the laws of the sages throughout the world, and for the first time it will be possible to sort out and discuss things with people...cast away Humaneness and Rightness, and at last Inner Power throughout the world will be the same from its profoundest depths.' (Graham, 208-9, mod.) Then society can be governed by a ruler who learns how to practice Non-action. In chapter 11, 'To Locate and Circumscribe,' we read:

> So if the gentleman is left with no choice but to preside over the world, his best policy is Non-action. Only by Non-action will he find security in the essentials of his nature and destiny. So if you value regard for you own person more than governing the world, you are fit to be entrusted with the world; if you love the care of your own person more than governing the world, you deserve to have the world delivered to you. If then a gentleman does prove able not to dislocate his Five Spheres [of vital energy] and not to stretch his eyesight and hearing, then sitting as still as a corpse he will look majestic as a dragon, from the silence of the abyss he will speak with a voice of thunder, he will move like a spirit and veer like Heaven, he will be relaxed and take no action.... (Graham, p. 212, mod.)

So if forced to rule the Primitivist author here follows the dictum of the *Daode jing* to take no action, that is, to act effortlessly, not interfering with your spontaneous response. By so acting you can 'locate and circumscribe' your nature by identifying and nurturing its spontaneous tendencies and preventing it from being led astray by Confucian cultural norms. The Primitivist here echoes the Yangists by arguing that to do this rulers must place their own self-cultivation first. However unlike the Yangists who maintain that personal longevity is the goal and purpose of human existence, the Primitivists maintains that returning to the 'simple and unhewn' unselfconscious mode of experience is this goal. In order to accomplish this rulers must practice inner cultivation and through this attain the profound tranquility and silence needed to find 'security in the essentials of nature and destiny.'

Thus the Primitivist authors in the *Zhuangzi* extend the definition of human nature past that of the Yangists by arguing that it consists not simply of the desire of the senses for sense-objects and the tendency for the biological systems these senses support to function harmoniously but of the tendency of these senses to spontaneously function clearly and for people to attain the 'simple and unhewn' unself-conscious state of mind. In other words, it is our most basic tendency to be able to experience the flowing

mode of cognition so often advocated in the 'Inner chapters.' It is this that links these chapters most strongly with the remainder of the *Zhuangzi*.

3.4 The Syncretist Chapters

The final stratum of the *Zhuangzi* contains a distinctive and largely consistent viewpoint that connects with the rest of the text and with a larger philosophical context. It is contained in three complete essays: 1. the first two-thirds of chapter 13, 'The Way of Heaven;' 2. chapter 15 'Inveterate Ideas,' and 3.the final chapter, 33, 'Below in the Empire,' as well as in narratives that play key roles in chapters 12 and 14. This material shares a common cosmology of the Way and interest in inner cultivation that we have seen in most of the rest of the text but veers in a different direction in its political thought, advocating a hierarchical social and political structure that incorporates the best ideas of other earlier intellectual lineages within a Daoist cosmological framework. However it agrees with the Primitivist idea that government should be led by a sage enlightened through inner cultivation techniques. In its general intellectual viewpoint it exemplifies many of the characteristics of the Daoist tradition that were first enunciated by the Han dynasty historian, Sima Tan (d. 110 B.C.E.), the man who coined the very term 'Daoism' (*dao-jia*):

> The Daoists enables the essential vital energy and spirit of human beings to be concentrated and unified. They move in unison with the Formless and provide adequately for all living things. In deriving their techniques, they follow the grand compliances [between humans and the cosmos] of the Naturalists, select the best of the Confucians and Mohists, and extract the essentials of the Terminologists and Legalists...[Daoists] take no action but also say that nothing is left undone. Their substance is easy to practice but their words are difficult to understand. Their techniques take emptiness and nothingness as the foundation, adaptation and compliance [with cosmic patterns] as the application....[They show how] the ruler [can] unite with the Great Dao, obscure and mysterious, and after illuminating the whole world revert to the Nameless. (Queen and Roth, pp. 279-82, mod.)

Thus, according to Sima Tan, Daoists advocate these essential ideas: 1. Humans can cultivate themselves to attain harmony of body and mind and to realize their essential connection to the Way and to the entire cosmos; 2. When rulers become adept at such 'inner cultivation' they can govern dispassionately and humanely according to the greater patterns of heaven and earth, upon which they model their social and political institutions; 3. While remaining faithful to this general Daoist orientation rulers should make use of the best ideas of other early intellectual lineages; 4. With these institutions and practices established, rulers can govern by taking no action while leaving nothing undone.

All these ideas are found in the Syncretist *Zhuangzi*. Inner cultivation practice is advocated to attain a deep and tranquil state of mind to enable both sages and rulers to act efficaciously in the world. In 'Inveterate Ideas' we read:

> Hence it is said that calm repose, silent stillness, empty nothingness, and Non-action: these

> are the even level of heaven and earth, the substance of the Way and its Inner Power; therefore sages find rest in them. At rest they are unperturbed and relaxed; being unperturbed and relaxed, they are calm and reposed. If they are unperturbed and relaxed, calm and reposed,
>
> Cares and misfortunes cannot enter
> Deviant vital energy cannot make inroads.
>
> Therefore their inner power is intact and their spirit is unimpaired. Hence it is said that sages:
>
> In life proceed with heaven,
> In death transform with other things.
> In stillness share the inner power of the Yin,
> In motion share the surge of the Yang.
> They won't make the first move to gain advantages,
> They won't take the first step to avoid trouble.
> Only when stirred will they respond,
> Only when pressed will they move.
> Only when it is inevitable will they arise,
> Rejecting knowledge and precedent
> They take their course from the patterns of heaven.
>
> (Graham, 265, mod.)

So sages attain profound levels of tranquility and through them they get in touch with the Way and preserve its inner power within them. They then make use of this experience to act spontaneously and harmoniously while being guided by the greater patterns of the cosmos. In other words, this is the Syncretists' version of attaining the flowing mode of cognition advocated in the other parts of the text. As if embracing the other viewpoints in the *Zhuangzi*, the Syncretist author of chapter 13, 'The Way of Heaven,' argues that this flowing mode can be applied to a variety of life circumstances:

> Empty tranquility, calm repose, silent stillness, and Non-action are the foundation of all living things. To be clear about these when you sit facing south is to be the kind of ruler [the legendary sage-king] Yao was. To be clear about these when you sit facing south is to be the kind of minister that [the legendary sage-minister] Shun was. To have these as your resources in a high position is the inner power which is in emperor, king, Son of Heaven. To have these as your resources in a low position is the Way of the obscure sage, the untitled king. Use these to settle in retirement or wander at leisure, and the hermits of river, sea, mountain, and forest will submit to you. Use these to come forward and act in order to bring comfort to the age and your achievement is great and name illustrious, and the empire is united. In stillness a sage, in motion a king, you do nothing yet are exalted, you

> are simple and unhewn yet no one in the empire is able to rival your glory. (Graham 259-60, mod.)

Hence, ruler and minister, politician and hermit can utilize flowing cognition; but it is perhaps when applied to rulership that it attains its greatest achievement. Government by enlightened sages who attain flowing cognition is the pinnacle of Daoist political thought for the Syncretist: it is symbolized above by the phrase ‘in stillness a sage, in motion a king,’ which is elsewhere in the final chapter 33 referred to as ‘to be inwardly a sage and outwardly a king.’ It is with this cultivated mind that the sage ruler establishes human society in parallel to the greater patterns of the cosmos. For example, human social and political hierarchies are based upon normative natural patterns:

> The ruler comes first, the minister follows; the father comes first, the son follows ... the senior comes first, the junior follows ... . Being exalted or lowly, first or last, belongs to the progressions of heaven and earth; therefore sages take their model from them ... spring and summer first, autumn and winter last, is the sequence of the four seasons ... . Heaven and earth are extremely numinous yet have sequences of the exalted and lowly, the first and the last, and how much more should this be true of the Way of human beings! If you expound a Way without their sequences, it is not their Way; and if you expound a Way which is not their Way, from what will you derive a Way? (Graham, 261, mod.)

This coordination of human society with cosmic patterns is a characteristic tenet of the early Daoist syncretic lineage that historians first called the ‘Way of the Yellow Emperor and Laozi’ (*Huang-Lao zhi dao*). This concern with cosmic patterns and their human parallels is incorporated from the Naturalist thinkers who first systematized the concepts of Yin and Yang (complementary negative and positive aspects of all living things). The Syncretist author of *Zhuangzi* 13 demonstrates further evidence of this characteristic adaptation of ideas from other early philosophical lineages:

> ...Therefore, the ancients who made clear the great Way first made heaven clear and the Way and its Inner Power were next. When the Way and its Inner Power were clear, [Confucian concepts of] humaneness and rightness were next. When humaneness and rightness were clear [Legalist concepts of] portions and responsibilities were next. When portions and responsibilities were clear, [Terminologist concepts of] title and performance were next ... when [Terminologist concepts of] judging right and wrong were clear, [Legalists concepts of] reward and punishment were next. ... This is how one served the ruler above or was pastor to the people below, put other things in order or cultivated one’s own person. Cleverness and strategy were not used and they invariably referred back to what was from heaven in them. It is this that is meant by supreme tranquillity, the utmost in government. (Graham 261-2, mod.)

This is an excellent example of the kind of Daoist syncretism Sima Tan describes and that survives in other early texts such as the *Huang-Lao Silk Manuscripts* found in 1973 at Ma-wang-tui (ca. 250 B.C.), parts of the philosophical compendia *Guanzi* (ca. 320-150 B.C.) and *Lüshi chunqiu* (240 B.C.), and the

Huai-nan Tzu (139 B.C.). All these works are the products of a loosely organized intellectual tradition of masters and disciples that carried Daoist ideas into the unified empire of second century B.C. China and that transmitted what we know of this philosophy into the modern world.

The final chapter of the *Zhuangzi*, 'Below in the Empire,' exemplifies this kind of syncretism in its analysis of early intellectual traditions. After establishing its own position, the comprehensive 'Way of Heaven and Earth' that embraces all the 'techniques of the Way,' it analyzes how each of these earlier traditions understood one part of this comprehensive Way but ultimately failed to grasp the whole. Zhuangzi himself is included in this analysis:

> ...Above he roamed with the maker of things; below, he made friends with those for whom life and death are externals and there is neither end nor beginning. As for the Foundation, he opened it up in all its comprehensiveness, ran riot in the vastness of its depths. As for the Ancestor, it may be said that by being in tune he withdrew all the way back to it. However, when one assents to transformation and is released from things, the body has not exhausted its pattern, having come it will not be shaken off. Abstruse! Obscure! A man who did not succeed in getting it all. (Graham 283, mod.)

The Syncretist author thus praises Zhuangzi for his depth of mystical cultivation but chides him for failing to realize that there are practical affairs in the world that must be attended to. It is an interesting yet telling comment. The Syncretist criticizes the very impractibility for which Zhuangzi became renowned to later literati. The irony is that without the more prosaic and responsible Syncretists, who transmitted earlier parts of the text that contained the authentic voice of Zhuangzi, the iconoclastic ideas of this philosophical giant may have never been known. This is because of the extensive support and patronage of early philosophy by the kings of the various 'warring states' starting in the middle of the fourth century B.C. and continuing into imperial times. These rulers were interested in learning how to govern more efficaciously. Philosophical works were valued for their teachings about rulership and virtually all the texts that were widely circulated during this period had some political relevance, including, of course, the *Daode jing*. The 'Inner Chapters' of *Zhuangzi* had none, but were preserved, as we have seen, in a larger collection that did contain important ideas for rulership.

So, in the last analysis, what is it that holds together this disparate collection of materials that were written over a span of more than a century? All the various authorial voices in the text (except possibly the Yangist) share a common interest in cultivating the spontaneous 'flowing mode' of cognition that is symbolized throughout the work by the 'heavenly' side of human beings. They vary somewhat in how they conceive of this mode and they apply it in different ways but nonetheless they concur in emphasizing its importance. It is possible that all the authors were part of an intellectual tradition that descended from the historical founder, Zhuangzi, by direct master-disciple lines and each authorial voice constitutes a generation of such descent. It is also possible that the *Zhuangzi* collection was compiled by later Daoists, perhaps those at the court of Liu An, the second king of Huai-nan, who were attempting to reconstruct a lost Zhuangzi lineage (Roth 1991). We cannot know for certain. The precise way this text formed has, in all likelihood, disappeared into the mists of time, but we can rejoice in the fact that because of its politically relevant final stratum, the entire text has not met the same fate.

Mally's Deontic Logic

In 1926, Mally presented the first formal system of deontic logic. His system had several consequences which Mally regarded as surprising but defensible. It also had a consequence ("A is obligatory if and only if A is the case") which Menger (1939) and almost all later deontic logicians have regarded as unacceptable. We will not only describe Mally's system but also discuss how it may be repaired.

1. Introduction

In 1926, the Austrian philosopher Ernst Mally (1879-1944) proposed the first formal system of deontic logic. In the book in which he presented this system, *The Basic Laws of Ought: Elements of the Logic of Willing*, Mally gave the following motivation for his enterprise:

> In 1919, everybody was using the word self-determination. I wanted to obtain a clear understanding of this word. But then, of course, I immediately stumbled on the difficulties and obscurities surrounding the concept of Ought, and the problem changed. The concept of Ought is the basic concept of the whole of ethics. It can only serve as a usable foundation for ethics when it is captured in a system of axioms. In the following I will

present such an axiomatic system.[1]

As Mally's words indicate, he was not primarily interested in deontic logic for its own sake: he mainly wanted to lay the foundation of "an exact system of pure ethics" (*eine exakte reine Ethik*). More than half of his book is devoted to the development of this exact system of ethics. In the following, we will, however, concentrate on the formal part of his book, both because it is its "hard core" and because it is the part that has attracted the most interest.

2. Mally's Formal Language

Mally based his formal system on the classical propositional calculus as formulated in Whitehead's and Russell's *Principia Mathematica* (vol. 1, 1910).

The non-deontic part of Mally's system had the following vocabulary: the sentential letters A, B, C, P and Q (these symbols refer to states of affairs), the sentential variables M and N, the sentential constants V (the *Verum*, Truth) and Λ (the *Falsum*, Falsity), the propositional quantifiers $\exists$ and $\forall$, and the connectives $\neg$, & , $\vee$, $\rightarrow$ and $\leftrightarrow$. Λ is defined by $\Lambda = \neg V$.

The deontic part of Mally's vocabulary consisted of the unary connective !, the binary connectives f and ∞, and the sentential constants U and $\cap$.

- Mally read !A as "A ought to be the case" (*A soll sein*) or as "let A be the case" (*es sei A*).
- He read A f B as "A requires B" (*A fordert B*).
- He read A ∞ B as "A and B require each other."
- He read U as "the unconditionally obligatory" (*das unbedingt Geforderte*).
- He read $\cap$ as "the unconditionally forbidden" (*das unbedingt Verbotene*).

f, ∞ and $\cap$ are defined by:

Def. f . A f B = A $\rightarrow$!B (Mally 1926, p. 12)

Def. ∞ . A ∞ B = (A f B) & (B f A)

Def. $\cap$. $\cap = \neg U$

Mally did not only read !A as "it ought to be the case that A." Because a person's willing that a given state of affairs A be the case is often expressed by sentences of the form "A ought to be the case" (for example, someone might say "it ought to be the case that I am rich and famous" to indicate that she wants to be rich and famous), he also read !A as "A is desirable" or "I want it to be the case that A." As a result, his formal system was as much a theory about *Wollen* (willing) as a theory about *Sollen* (ought to be the case). This explains the subtitle of his book. In modern deontic logic, the basic deontic connective O is seldom read in this way.

We have just described one respect in which Mally's deontic logic was different from more modern proposals. There are two other conspicuous differences:

- Mally was only interested in the deontic status of states of affairs; he paid no special attention to the deontic status of actions. Thus, his *Deontik* was a theory about *Seinsollen* (what ought to be the case) rather than *Tunsollen* (what ought to be done). Modern authors often regard the concept of *Tunsollen* as fundamental.
- In modern deontic logic, the notions of prohibition F, permission P and waiver W are usually defined in terms of obligation O: $FA = O\neg A$, $PA = \neg FA$, $WA = \neg OA$. Such definitions are not to be found in Mally's book.

3. Mally's Axioms

Mally adopted the following informal deontic principles (Mally 1926, pp. 15-19):

(i) If A requires B and if B then C, then A requires C.

(ii) If A requires B and if A requires C, then A requires B and C.

(iii) A requires B if and only if it is obligatory that if A then B.

(iv) The unconditionally obligatory is obligatory.

(v) The unconditionally obligatory does not require its own negation.

Mally did not offer much support for these principles. They simply seemed intuitively plausible to him.

Mally formalized his principles as follows (Mally 1926, pp. 15-19):

I. $((A \mathrm{f} B) \& (B \rightarrow C)) \rightarrow (A \mathrm{f} C)$

II. $((A \mathrm{f} B) \& (A \mathrm{f} C)) \rightarrow (A \mathrm{f} (B \& C))$

III. $(A \mathrm{f} B) \leftrightarrow !(A \rightarrow B)$

IV. $\exists U\, !U$

V. $\neg(U \mathrm{f} \cap)$

Axiom IV is strange:

- $!U$ is a more natural formalization of (iv).
- Axiom IV seems redundant: $!A \rightarrow !A$ is a tautology, so we have $!A \mathrm{f} A$ by Def. f, whence !(!A

$\rightarrow$ A) by Axiom III($\rightarrow$), whence $\exists$M !M by existential generalization. Axiom IV seems to add nothing to this.

- Axiom IV is the only axiom or theorem mentioned by Mally in which U occurs as a bound variable: in Axiom V and in theorems (15)-(17), (20)-(21), (23), (23′) and (27)-(35) (to be displayed below), U is either a constant or a free variable. One should treat it in the same way in the formalization of (iv).

For these reasons, we replace Axiom IV by the following axiom:[2]

IV. !U

Mally could hardly have objected to this version of Axiom IV because it is equivalent with his theorem (23′), i.e., V f U, in virtue of Def. f. In the following "Axiom IV" will always refer to our version of Axiom IV rather than Mally's.

Using Def. f, Axioms I-V may also be written as follows (Mally 1926, pp. 15-19 and p. 24):

I′. $((A \rightarrow\ !B)\ \&\ (B \rightarrow C)) \rightarrow (A \rightarrow\ !C)$

II′. $((A \rightarrow\ !B)\ \&\ (A \rightarrow\ !C)) \rightarrow (A \rightarrow\ !(B\ \&\ C))$

III′. $(A \rightarrow\ !B) \leftrightarrow\ !(A \rightarrow B)$

IV′. V f U

V′. $\neg(U \rightarrow\ !\cap)$

4. Mally's Theorems

Mally derived the following theorems from his axioms (Mally 1926, pp. 20-34).[3]

(1) $(A \text{ f } B) \rightarrow (A \text{ f } V)$

(2) $(A \text{ f } \wedge) \leftrightarrow \forall M\ (A \text{ f } M)$

(3) $((M \text{ f } A) \vee (M \text{ f } B)) \rightarrow (M \text{ f } (A \vee B))$

(4) $((M \text{ f } A)\ \&\ (N \text{ f } B)) \rightarrow ((M\ \&\ N) \text{ f } (A\ \&\ B))$

(5) $!P \leftrightarrow \forall M\ (M \text{ f } P)$

(6) $(!P\ \&\ (P \rightarrow Q)) \rightarrow\ !Q$

(7) $!P \rightarrow\ !V$

(8) $((A \text{ f } B) \,\&\, (B \text{ f } C)) \rightarrow (A \text{ f } C)$

(9) $(!P \,\&\, (P \text{ f } Q)) \rightarrow\ !Q$

(10) $(!A \,\&\, !B) \leftrightarrow\ !(A \,\&\, B)$

(11) $(A \infty B) \leftrightarrow\ !(A \leftrightarrow B)$

(12) $(A \text{ f } B) \leftrightarrow (A \rightarrow\ !B) \leftrightarrow\ !(A \rightarrow B) \leftrightarrow\ !\neg(A \,\&\, \neg B) \leftrightarrow\ !(\neg A \vee B)$

(13) $(A \rightarrow\ !B) \leftrightarrow \neg(A \,\&\, \neg!B) \leftrightarrow (\neg A \vee\ !B)$

(14) $(A \text{ f } B) \leftrightarrow (\neg B \text{ f } \neg A)$

(15) $\forall M\, (M \text{ f } U)$

(16) $(U \rightarrow A) \rightarrow\ !A$

(17) $(U \text{ f } A) \rightarrow\ !A$

(18) $!!A \rightarrow\ !A$

(19) $!!A \leftrightarrow\ !A$

(20) $(U \text{ f } A) \leftrightarrow (A \infty U)$

(21) $!A \leftrightarrow (A \infty U)$

(22) $!V$

(23) $V \infty U$

(23′) $V \text{ f } U$

(24) $A \text{ f } A$

(25) $(A \rightarrow B) \rightarrow (A \text{ f } B)$

(26) $(A \leftrightarrow B) \rightarrow (A \infty B)$

(27) $\forall M\, (\bigcap \text{ f } \neg M)$

(28) $\bigcap \text{ f } \bigcap$

(29) $\bigcap \text{ f } U$

(30) $\bigcap \text{ f } \Lambda$

(31) $\bigcap \infty \Lambda$

(32) $\neg(U \text{ f } \Lambda)$

(33) $\neg(U \rightarrow \Lambda)$

(34) $U \leftrightarrow V$

(35) $\bigcap \leftrightarrow \Lambda$

5. Surprising Consequences

Mally called theorems (1), (2), (7), (22) and (27)-(35) "surprising" (*befremdlich*) or even "paradoxical" (*paradox*). He viewed (34) and (35) as the most surprising of his surprising theorems. But Mally's reasons for calling these theorems surprising are puzzling if not confused.

Consider, for example, theorem (1). Mally interpreted this theorem as follows: "if A requires B, then A requires everything that is the case" (Mally 1926, p. 20). He regarded this as a surprising claim, and we agree. However, Mally's interpretation of (1) is not warranted. (1) only says that if A requires B, then A requires the *Verum*. The expression "if A requires B, then A requires everything that is the case" is to be formalized as

$$(1') \quad (A \text{ f } B) \rightarrow (C \rightarrow (A \text{ f } C))$$

This formula is an immediate consequence of (1) in virtue of Axiom I. In other words, Mally should have reasoned as follows: (1′) is surprising; but (1′) is an immediate consequence of (1) in virtue of Axiom I; Axiom 1 is uncontroversial; so (1) is to be regarded as surprising.

A similar pattern is to be seen in many of Mally's other remarks about theorems which surprised him. He generally read too much into them and confused them with some of the consequences they had in his system:

- Mally was surprised by (2) because he thought that it says that if A requires B and B is not the case, then A requires every state of affairs whatsoever (Mally 1926, p. 21). But (2) says no such thing. Mally's paraphrase is a paraphrase of $(A \text{ f } B) \rightarrow (\neg B \rightarrow (A \text{ f } C))$ (a consequence of (2) in virtue of Axiom I) rather than (2).
- Mally paraphrased (7) as "if anything is required, then everything that is the case is required" (Mally 1926, p. 28), which is indeed surprising. However, Mally's paraphrase corresponds with $!A \rightarrow (B \rightarrow !B)$ (a consequence of (7) in virtue of Axiom I) rather than (7).
- Mally paraphrased (22) as "the facts ought to be the case" (Mally 1926, p. 24). We grant that this is a surprising claim. But the corresponding formula in Mally's language is $A \rightarrow !A$ (a consequence of (22) in virtue of Axiom I), not (22).
- Mally read (27) as "if something which ought not to be the case is the case, then anything whatsoever ought to be the case" (Mally 1926, pp. 24, 33), but this is a paraphrase of $!\neg A \rightarrow (A \rightarrow !B)$ (a theorem of Mally's system) rather than (27).
- Mally paraphrased (33) as "what is not the case is not obligatory" (Mally 1926, p. 25) and as "everything that is obligatory is the case" (Mally 1926, p. 34). These assertions are indeed surprising, but Mally's readings of (33) are not warranted. They are paraphrases of $!A \rightarrow A$ rather than (33).
- Mally made the following remark about (34) and (35):

> The latter sentences, which seem to identify being obligatory with being the case, are surely the most surprising of our "surprising consequences."[4]

> However, (34) and (35) do not assert that being obligatory is equivalent with being the case, for the latter statement should be formalized as $A \leftrightarrow\, !A$. The latter formula is a theorem of Mally's system, as will be shown in a moment, but it is not to be found in Mally's book.

Mally regarded theorems (28)-(32) as surprising because of their relationships with certain other surprising theorems:

- (28)-(30) are instantiations of (27). But this is not sufficient to call these theorems surprising. Mally actually viewed (28) as less surprising than (27): one might use it to justify retaliation and revenge (Mally 1926, p. 24).
- (31) implies (28)-(30) and is therefore at least as surprising as those theorems.
- Mally viewed (32) as surprising because the surprising theorem (33) is an immediate consequence of (32) and the apparently non-surprising theorem (25).

Mally's list of surprising theorems seems too short: for example, (24) is equivalent with $A \rightarrow\, !A$ in virtue of Def. f. But $A \rightarrow\, !A$ may be paraphrased as "the facts ought to be the case," an assertion which Mally regarded as surprising (Mally 1926, p. 24). So then why didn't he call (24) surprising? Did it not surprise him after (22)?

Even though Mally regarded many of his theorems as surprising, he thought that he had discovered an interesting concept of "correct willing" (*richtiges Wollen*) or "willing in accordance with the facts" which should not be confused with the notions of obligation and willing used in ordinary discourse. Mally's "exact system of pure ethics" was mainly concerned with this concept, but we will not describe this system because it belongs to the field of ethics rather than deontic logic.

6. Menger's Criticism

In 1939, Karl Menger published a devastating critique of Mally's formal system. He first pointed out that $A \leftrightarrow\, !A$ is a theorem of this system. In other words, if A is the case, then A is obligatory, and if A ought to be the case then A is indeed the case. As we have already noted in connection with theorems (34) and (35), Mally made the same claim in informal terms, but the formula $A \leftrightarrow\, !A$ does not occur in his book.

Menger's theorem $A \leftrightarrow\, !A$ may be proven as follows (Menger's proof was different; **PC** denotes the propositional calculus).

First, $A \rightarrow\, !A$ is a theorem:

1.	$A \rightarrow ((!B \rightarrow !B) \,\&\, (B \rightarrow A))$	[**PC**][5]
2.	$((!B \rightarrow !B) \,\&\, (B \rightarrow A)) \rightarrow (!B \rightarrow !A)$	[I′]
3.	$A \rightarrow (!B \rightarrow !A)$	[1, 2, **PC**]
4.	$!B \rightarrow (A \rightarrow !A)$	[3, **PC**]
5a.	$!U$	[Ax. IV]
5b.	$!(!A \rightarrow A)$	[III′($\rightarrow$), **PC**]
6.	$A \rightarrow !A$	[4, either 5a or 5b, **PC**]

Second, $!A \rightarrow A$ is a theorem:

1.	$((U \rightarrow !A) \,\&\, (A \rightarrow \cap)) \rightarrow (U \rightarrow !\cap)$	[I′]
2.	$\neg((U \rightarrow !A) \,\&\, (A \rightarrow \cap))$	[1, V′, **PC**]
3.	$\neg((U \rightarrow !A) \,\&\, (A \rightarrow \cap)) \rightarrow (!A \rightarrow A)$	[**PC**][6]
4.	$!A \rightarrow A$	[2, 3, **PC**]

Because $A \rightarrow !A$ and $!A \rightarrow A$ are theorems, $A \leftrightarrow !A$ is a theorem as well.

Menger gave the following comment:

> This result seems to me to be detrimental for Mally's theory, however. It indicates that the introduction of the sign ! is superfluous in the sense that it may be cancelled or inserted in any formula at any place we please. But this result (in spite of Mally's philosophical justification) clearly contradicts not only our use of the word "ought" but also some of Mally's own correct remarks about this concept, e.g. the one at the beginning of his development to the effect that $p \rightarrow (!q \text{ or } !r)$ and $p \rightarrow !(q \text{ or } r)$ are not equivalent. Mally is quite right that these two propositions are not equivalent according to the ordinary use of the word "ought." But they are equivalent according to his theory by virtue of the equivalence of p and !p (Menger 1939, p. 58).

Almost all deontic logicians have accepted Menger's verdict. After 1939, Mally's deontic system has seldom been taken seriously.

7. Where Did Mally Go Wrong?

Where did Mally go wrong? How could one construct a system of deontic logic which does more justice to the notion of obligation used in ordinary discourse? Three types of answers are possible:

- Mally should not have added his deontic axioms to classical propositional logic;
- Some of his deontic principles should be modified; and
- Both of the above. Menger advocated the latter view: "One of the reasons for the failure of Mally's interesting attempt is that it was founded on the 2-valued calculus of propositions" (Menger 1939, p. 59).

We will only explore the first two suggestions. Each of them will turn out to be sufficient, so the third proposal is overkill.

We will first show that if Mally's deontic principles are added to a system in which the so-called paradoxes of material and strict implication are avoided, many of the "surprising" theorems (such as (34) and (35)) are no longer derivable and A ↔ !A is no longer derivable either. But most of the theorems which Mally regarded as "plausible" are still derivable. The resulting system is closely related to Anderson's relevant deontic logic (1967).

After this, we will show that one might also modify some of the specifically deontic principles: Def. f and Axiom I may be modified in such a way that the resulting system is almost identical with the system nowadays known as standard deontic logic. The resulting system agrees less well with Mally's deontic expectations (as revealed by his expressions of surprise) than the first one does, but it is adequate in the sense that (34), (35) and A ↔ !A are no longer derivable.

8. Alternative Non-Deontic Bases

Mally's informal postulates (i)-(iii) and (v) are conditionals or negations of conditionals, i.e., of the form "if ... then --" or "not: if ... then --." Føllesdal and Hilpinen (1981, pp. 5-6) have suggested that such conditionals should not be formalized in terms of material implication and that some sort of strict implication would be more appropriate. But this suggestion is not altogether satisfactory, for if I′ and III′ are added to the rather weak system of strict implication **S3** (with → as the symbol of strict implication), then the undesirable theorem A → !A is again derivable.[7]

In systems of strict implication the so-called paradoxes of material implication (such as A → (B → A)) are avoided, but the so-called paradoxes of strict implication (such as (A & ¬A) → B) remain. What would happen to Mally's system if *both* kinds of paradoxes were avoided? This question can be answered by adding Mally's axioms to a system in which none of the so-called "fallacies of relevance" can be derived (see the entry on relevance logic).

In the following, we will add Mally's axioms to the most popular system of this type, relevant system **R**. The result is better than in the case of **S3**: most of the theorems which Mally regarded as surprising are no longer derivable, and Menger's theorem A ↔ !A is not derivable either. But many "plausible" theorems can still be derived.

Relevant system **R** with the propositional constant t ("the conjunction of all truths") has the following axioms and rules (Anderson & Belnap 1975, ch. V; $\leftrightarrow$ is defined by $A \leftrightarrow B = (A \to B) \& (B \to A)$):

Self-implication.	$A \to A$
Prefixing.	$(A \to B) \to ((C \to A) \to (C \to B))$
Contraction.	$(A \to (A \to B)) \to (A \to B)$
Permutation.	$(A \to (B \to C)) \to (B \to (A \to C))$
& Elimination.	$(A \& B) \to A$, $(A \& B) \to B$
& Introduction.	$((A \to B) \& (A \to C)) \to (A \to (B \& C))$
$\vee$ Introduction.	$A \to (A \vee B)$, $B \to (A \vee B)$
$\vee$ Elimination.	$((A \to C) \& (B \to C)) \to ((A \vee B) \to C)$
Distribution.	$(A \& (B \vee C)) \to ((A \& B) \vee C)$
Double Negation.	$\neg\neg A \to A$
Contraposition.	$(A \to \neg B) \to (B \to \neg A)$
Ax. t.	$A \leftrightarrow (t \to A)$
Modus Ponens.	$A, A \to B / B$
Adjunction.	$A, B / A \& B$

A relevant version **RD** of Mally's deontic system may be defined as follows:

- The language is the same as the language of **R**, except that we write V instead of t, add the propositional constant U and the unary connective !, and define $\wedge$, $\cap$, f and ∞ as in Mally's system.
- Axiomatization: add Mally's Axioms I-V to the axioms and rules of **R**.

RD has the following properties.

- Axioms I, II and III may be replaced by the following three simpler axioms:[8]

I*. $(A \to B) \to (!A \to !B)$

II*. $(!A \& !B) \to !(A \& B)$

III*. $!(!A \to A)$

- Formulas I′-V′, (3), (4), (6), (8)-(11), (14), (16)-(18), (23′) and (30) are theorems of **RD**.[9]
- Formulas (1), (2), (5), (7), (12), (13), (15), (19)-(23), (24)-(29), (31)-(35), A → !A and !A → A are not derivable.[10]
- There are 12 mismatches between **RD** and Mally's expectations: (5), (12)-(13), (15), (19)-(21), (23) and (24)-(26) are not derivable even though Mally did not regard these formulas as surprising, and (30) is a theorem even though Mally viewed it as surprising.
- Formulas (34) and (35) (the formulas which Mally viewed as the most surprising theorems of his system) are in a sense stranger than Menger's theorem A ↔ !A because the latter theorem is derivable in **RD** supplemented with (34) or (35) while neither (34) nor (35) is derivable in **RD** supplemented with A ↔ !A.[11]

Although most of Mally's surprising theorems are not derivable in **RD**, this has nothing to do with Mally's own reasons for regarding these theorems as surprising. They are not derivable in **RD** because they depend on fallacies of relevance. Mally never referred to such fallacies to explain his surprise. His considerations were quite different, as we have already described.

RD is closely related to Anderson's relevant deontic logic **ARD**, which is defined as **R** supplemented with the following two axioms (Anderson 1967, 1968, McArthur 1981; Anderson used the unary connective O instead of !):

ARD1. $!A \leftrightarrow (\neg A \rightarrow \cap)$

ARD2. $!A \rightarrow \neg!\neg A$

- All theorems of **RD** are theorems of **ARD**.[12]
- ARD1(→) is not a theorem of **RD**+ARD2.[13] This formula does not occur in Mally's book. According to Anderson, Bohnert (1945) was the first one to propose it.[14]
- ARD2 is not a theorem of **RD**+ARD1.[15] This formula does not occur in Mally's book, but Mally endorsed the corresponding informal principle: "a person who wills correctly does not will (not even implicitly) the negation of what he wills; correct willing is free of contradictions."[16]
- **RD** supplemented with ARD1(→) and ARD2 has the same theorems as **ARD**.[17]

Anderson's system has several problematical features (McArthur 1981, Goble 1999, 2001) and **RD** shares most of these features. But we will not go into this issue here. It is at any rate clear that **RD** is better than Mally's original system.

9. Alternative Deontic Principles

Instead of changing the non-deontic propositional basis of Mally's system, one might also modify the specifically deontic axioms and rules. This might of course be done in various ways, but the following approach works well without departing too much from Mally's original assumptions.[18]

First, regard f as primitive and replace Mally's definition of f in terms of → and ! (Def. f, the very first specifically deontic postulate in Mally's book) by the following definition of ! in terms of V and f :

Def. !. !A = V f A

Second, replace Axiom I, which may also be written as (B → C) → ((A f B) → (A f C)), with the following *rule of inference*:

R f . B → C / (A f B) → (A f C)

We may then derive:

1.	B → C / !B → !C	[Def. !, R f]
2.	(!A & !B) → !(A & B)	[Def. !, Ax. II]
3.	!V	[1, Ax. IV, **PC**]
4.	¬!⋀	[1, Ax. III(←), Ax. V, **PC** (ex falso)]

The so-called standard system of deontic logic **KD** is defined as **PC** supplemented with 1-4 (except that ! is usually written as O: see the entry on deontic logic), so the new system is at least as strong as **KD**. It is not difficult to see that it is in fact identical with **KD** supplemented with OU (Mally's Axiom IV) and the following definition of f : A f B = O(A → B). In modern deontic logic, the notion of *commitment* is sometimes defined in this way.

In the new system, Mally's theorems have the following status.

- II′, IV′, (1)-(5), (7)-(11), (13)-(15), (17), (20)-(24) and (27)-(32) are derivable.
- I′, III′, V′, (6), (12), (16), (18)-(19), (25)-(26), (33)-(35), A → !A and !A → A are not derivable.
- There are 20 mismatches with Mally's deontic expectations: 10 "plausible" formulas are no longer derivable, namely I′, V′, (6), (12), (16), (18)-(19) and (25)-(26), and 10 "surprising" theorems are still derivable, namely (1), (2), (7), (22) and (27)-(32).
- Although (34) and (35) are not derivable, adding them would by no means lead to the theoremhood of A ↔ !A.

There were only 12 mismatches in the case of **RD**, so the new system does less justice to Mally's deontic expectations than **RD** did. But it agrees better with his general outlook because it is still based on classical propositional logic, a system to which Mally did not object (not that he had much choice in the 1920s).

Many of Mally's surprising theorems are derivable in **KD**, but they have, as it were, lost their sting: those theorems lead to surprising consequences when combined with Mally's Axiom I and his definition of f , but they are completely harmless without these postulates.

The standard system of deontic logic has several problematical features. The fact that each provable statement is obligatory is often regarded as counterintuitive, and there are many other well-known "paradoxes." The revised version of Mally's system shares these problematical features. But we will not discuss these issues here. The standard system is at any rate better than Mally's original proposal.

10. Conclusion

Mally's deontic logic is unacceptable for the reasons stated by Menger (1939). But it is not as bad as it may seem at first sight. Only relatively minor modifications are needed to turn it into a more acceptable system. One may either change the non-deontic basis to get a system that is similar to Anderson's system, or apply two patches to the deontic postulates to obtain a system similar to standard deontic logic.

Some authors have refused to view Mally's deontic logic as a "real" deontic system and say that they "mention it only by way of curiosity" (Meyer and Wieringa 1993, p. 4). The above shows that this judgment is too harsh. It is only a small step, not a giant leap, from Mally's system to modern systems of deontic logic, so Mally's pioneering effort deserves rehabilitation rather than contempt.

Acknowledgments

The author is very grateful to Lou Goble, whose extensive comments on two earlier drafts led to many substantial improvements. The author would also like to thank Lou Goble and Edgar Morscher for making their papers on Anderson's and Mally's deontic logic available to him, and Robert K. Meyer for helping him find the matrices used in note 10.

Notes to Mally's Deontic Logic

Notes

1. *Im Jahre 1919 wurde mir das Wort Selbstbestimmung, das in aller Leute Munde war, Anlaß eines Versuches, mir einen klaren Begriff zu dem Wort zu bilden. Natürlich stieß ich dabei alsbald auf die Schwierigkeiten und Dunkelheiten des Sollensbegriffes: das Problem wandelte sich. Grundbegriff aller Ethik, kann der Begriff des Sollens ein brauchbares Fundament ihres Aufbaus nur geben, wenn er in einem System von Axiomen festgelegt ist. Ein solches Axiomensystem führe ich hier vor* (Mally 1926, Preface, p. I).

2. Menger (1939, p. 57) and Føllesdal and Hilpinen (1981, pp. 2-3) made the same decision.

3. Menger (1939, p. 58) said that Mally derived "fifty" theorems, while Føllesdal and Hilpinen (1981, p. 3) said that Mally derived "about fifty" theorems. They probably included some of Mally's unnumbered theorems, which Mally mentioned only in passing. Our list consists of Mally's thirty-six explicitly numbered theorems.

4. *Diese letzten Sätze, die Seinsollen und Tatsächlichsein zu identifizieren scheinen, sind unter unseren "befremdlichen Folgerungen" wohl die befremdlichsten* (Mally 1926, p. 25).

5. The formula on this line is a theorem of the classical propositional calculus because A → (B → B) and A → (B → A) are theorems of this calculus.

6. The formula on this line is a theorem of the classical propositional calculus because

$$
\begin{aligned}
\neg((U \to !A) \,\&\, (A \to \cap)) &\leftrightarrow \neg((U \to !A) \,\&\, (U \to \neg A)) \\
&\leftrightarrow \neg(U \to (!A \,\&\, \neg A)) \\
&\leftrightarrow U \,\&\, \neg(!A \,\&\, \neg A) \\
&\to !A \to A
\end{aligned}
$$

7. On **S3**, see Hacking 1963. The proof that A → !A is a theorem of **S3** enriched with ! and supplemented with I′ and III′ is straightforward and left to the reader.

8. We only prove that I* is a theorem of **RD**. The other five cases (II* and III* are theorems of **RD** and I-

III follow from I*-III*) are left to the reader.

1. $(!A \rightarrow !A) \,\&\, (A \rightarrow ((A \rightarrow B) \rightarrow B))$ [**R**]
2. $!A \rightarrow !((A \rightarrow B) \rightarrow B)$ [1, Ax. I, Def. f]
3. $!A \rightarrow ((A \rightarrow B) \rightarrow !B)$ [2, Ax. III($\leftarrow$), Def. f]
4. $(A \rightarrow B) \rightarrow (!A \rightarrow !B)$ [3, Permutation]

9. Most cases are obvious but some hints for (16)-(18) and (30) may be helpful. (16) is a consequence of I* and IV. (17) follows from (16) and (18). (18) may be proven as follows:

1. $!(!A \rightarrow A) \,\&\, !(!!A \rightarrow !A)$ [III* (twice), Adjunction]
2. $!((!A \rightarrow A) \,\&\, (!!A \rightarrow !A))$ [1, II*]
3. $((!A \rightarrow A) \,\&\, (!!A \rightarrow !A)) \rightarrow (!!A \rightarrow A)$ [**R**]
4. $!((!A \rightarrow A) \,\&\, (!!A \rightarrow !A)) \rightarrow !(!!A \rightarrow A)$ [3, I*]
5. $!(!!A \rightarrow A)$ [2, 4]
6. $!!A \rightarrow !A$ [5, Ax. III($\leftarrow$), Def. f]

(30) is proven as follows: we have $\cap \rightarrow (V \rightarrow \cap)$ by Ax. t, whence $\cap \rightarrow (U \rightarrow \wedge)$ by Contraposition and Double Negation, whence $\cap \rightarrow !\wedge$ by (16).

10. In order to prove this claim, we first have to remove an obstacle: (2), (5), (15) and (27) do not belong to the language of **RD** because they contain propositional quantifiers. If such quantifiers were added in the usual way (Anderson, Belnap & Dunn 1992, sec. 32), then we could easily prove that (2), (5), (15) and (27) are deductively equivalent with (2′), (5′), (15′) and (27′), respectively:

(2′) $(A \text{ f } \wedge) \rightarrow (A \text{ f } B)$

(5′) $(!A \rightarrow (B \text{ f } A)) \,\&\, ((V \text{ f } A) \rightarrow !A)$

(15′) $A \text{ f } U$

(27′) $\cap \text{ f } A$

To avoid needless complications, we will not equip **RD** with quantifiers, but confine our attention to the unquantified versions of (2), (5), (15) and (27). We may now proceed with the actual proof. We use the following matrices:

⥽	0	1	2	3	4	5	¬
0	5	5	5	5	5	5	5
1	0	1	2	3	4	5	4
2	0	0	1	1	3	5	3
3	0	0	0	1	2	5	2
4	0	0	0	0	1	5	1
5	0	0	0	0	0	5	0

&	0	1	2	3	4	5
0	0	0	0	0	0	0
1	0	1	0	1	0	1
2	0	0	2	2	2	2
3	0	1	2	3	2	3
4	0	0	2	2	4	4
5	0	1	2	3	4	5

Each theorem M of **RD** has the following property: v(M)∈{1, 3, 5} for every assignment v of values to the variables in M such that

- v(A) ∈ {0, 1, 2, 3, 4, 5},
- v(V) = 1,
- v(U) = 2,
- v(¬A), v(A ⥽ B) and v(A & B) are as indicated in the tables,
- v(A ∨ B) = v(¬(¬A & ¬B)), and
- v(!A) = v(U ⥽ A).

(1), (2), (5), (7), (12), (13), (15), (19)-(23), (24)-(29), (31)-(35), A ⥽ !A and !A ⥽ A (unquantified versions) lack this property, so these formulas are not theorems of **RD**. (These matrices were discovered by the computer program MaGIC. See the section *Other Internet Resources* for information on this program. The claims we have made were verified by a simple Perl-script of our own making.)

11. Menger's theorem A ↔ !A is a theorem of both **RD**+(34) and **RD**+(35):

1. A ↔ (V ⥽ A)	[Ax. t]
2. A ↔ (U ⥽ A)	[1, either (34) or (35)]
3. A ⥽ !A	[2, (16)]
4. (A ⥽ ∩) ⥽ ((U ⥽ !A) ⥽ (U ⥽ !∩))	[I*, Prefixing]
5. (A ⥽ ∩) ⥽ (¬(U ⥽ !∩) ⥽ ¬(U ⥽ !A))	[4, Contraposition]
6. ¬(U ⥽ !∩) ⥽ ((A ⥽ ∩) ⥽ ¬(U ⥽ !A))	[5, Permutation]
7. (A ⥽ ∩) ⥽ ¬(U ⥽ !A)	[6, Ax. V, Def. f]
8. !A ⥽ A	[2, 7, **R**]

9. A ↔ !A [3, 8, Adjunction]

However, neither (34) nor (35) is derivable in **RD** supplemented with A ↔ !A. To prove this, we use the following table from Anderson and Belnap 1975, p. 148:

→	0 1 2	¬
0	2 2 2	2
1	0 1 2	1
2	0 0 2	0

Each theorem M of **RD**+{A ↔ !A} has the following property: v(M) ∈ {1, 2} for every assignment v of values to the variables in M such that

- v(A)∈ {0, 1, 2},
- v(V) = 1,
- v(U) = 2,
- v(¬A) and v(A → B) are as indicated in the table,
- v(A & B) = min{v(A), v(B)},
- v(A ∨ B) = max{v(A), v(B)}, and
- v(!A) = v(A).

But v((34)) = v(U → V) = 0 and v((35)) = v(⋀ → ⋂) = 0, so (34) and (35) are not theorems of **RD**+{A ↔ !A}.

12. See Lokhorst 1999, pp. 277-278.

13. One may use the three-valued matrices of note 11 to prove this.

14. Anderson 1967, p. 348. However, Menger (1939, p. 59) had already defined "I command p" as "unless p, something unpleasant will happen," or in symbols: Cp ↔ (¬p → A), where Cp stands for "I command p" and A denotes the statement that the unpleasant thing will happen.

15. One may use the six-valued matrices of note 10 to prove this.

16. *Wer richtig will, will nicht (auch nicht impliziterweise) das Negat des Gewollten; richtiges Wollen ist widerspruchsfrei* (Mally 1926, p. 49). Mally regarded this as a paraphrase of Axiom V, but this is not entirely correct. Morscher (1998, p. 106) has suggested that ARD2 expresses Mally's intentions more

adequately than Axiom V does.

17. ARD1 is a theorem of **RD**+ARD1($\rightarrow$) by virtue of theorem (16), i.e., ARD1($\leftarrow$). This completes the proof. Notice that Axiom V is redundant because we have !U by Ax. IV, whence $\neg!\cap$ by ARD2, whence $\neg(U \rightarrow \cap)$ by ARD1, whence $\neg(U \rightarrow (U \rightarrow \cap))$ by **R**, whence $\neg(U \rightarrow !\cap)$ by ARD1, whence Axiom V by Def. f.

18. Morscher (1998) has made a somewhat similar proposal, but the details are different. The present approach was inspired by a number of suggestions made by Lou Goble.

Theological Voluntarism

There is a class of metaethical and normative views that commonly goes by the name ‘divine command theory.’ What all members of this class have in common is that they hold that what God wills is relevant to determining the moral status of some set of entities (acts, states of affairs, character traits, etc., or some combination of these). But the name ‘divine command theory’ is a bit misleading: what these views have in common is their appeal to the divine will; while many of these views hold that the relevant act of divine will is that of commanding, some deny it. So we would do well to have a label for this class of views that does not prejudge the issue of the relevant act of divine will. The label that I will use, following Quinn 1990, is ‘theological voluntarism.’

I have three aims in this article. I want first to distinguish metaethical versions of theological voluntarism from normative versions of that view, putting to the side normative versions. Second, I will say something about the main lines of defense of theological voluntarism, the various theoretical options that confront defenders of theological voluntarism, and some of the reasons for affirming or rejecting these different possible formulations. And finally I will say a bit about the sort of difficulties that seem to confront any such views. (I do not, however, give an account of the history of theological voluntarism in moral philosophy; for an anthology of readings covering a broad swath of this history, see Idziak 1979.)

1. Metaethical and normative theological voluntarism

To be a theological voluntarist is to hold that entities of some kind have at least some of their moral statuses in virtue of certain acts of divine will. But some instances of this view are metaethical theses; some instances of it are normative theses.

Consider, for example, theological voluntarism about the status of acts as obligatory or non-obligatory. One might hold that there is a single supreme obligation, the obligation to obey God. Every particular type of act that one might perform thus has its moral status as obligatory or non-obligatory in virtue of God's having commanded the performance of acts of that type or God's not having commanded acts of that type. This is a common version of divine command theory, according to which all of the more workaday obligations that we are under (not to steal from each other, not to murder each other, to help each other out when it would not be inconvenient, etc.) bind us as a result of the exercise of God's supreme practical authority.

The view just described is a version of *normative* theological voluntarism. It is a normative view because it asserts that some normative state of affairs obtains -- namely, the normative state of affairs *its being obligatory to obey God*. And it is a version of theological voluntarism because it holds that all other normative states of affairs, at least those involving obligation, obtain in virtue of God's commanding activity.

Metaethical theological voluntarist views, by contrast, do not assert the obtaining of any normative state of affairs. It is possible for one to be a metaethical theological voluntarist and to hold that no normative states of affairs obtain. Rather, metaethical theological voluntarists aim to say something interesting and informative about moral concepts, properties, or states of affairs; and they want to say something interesting and informative about them by connecting them to acts of the divine will. Metaethical theological voluntarists might claim that (e.g.) obligation is a theological concept, or that the property of being obligatory is a theological property, or that obligations are caused immediately by the divine will. But note that none of these views asserts that there are any obligations.

1.1 Theological voluntarism and theism

One does not have to be a theist in order to be a theological voluntarist. One can affirm normative theological voluntarism or metaethical theological voluntarism while failing to affirm theism; atheists and agnostics can be theological voluntarists of either stripe. With respect to normative theological voluntarism: one might claim that while it is true that any being that merits the title of ‘God’ merits obedience, we should not believe that there is such a being. (Compare: if, through some glitch in

promotions, there happened to be no lieutenants in the army at some time, it would not cease to be true that privates ought to obey lieutenants. One could believe that that there are no lieutenants while believing that privates ought to obey their lieutenants.) With respect to metaethical theological voluntarism: one might claim that, for example, the concept of obligation is ineliminably theistic, though there is no God; that God does not exist counts not against metaethical theological voluntarism but rather against the claim that the concept of obligation has application. (Compare: one might believe that 'sin' is properly defined as 'offense against God.' One can clearly affirm this definition while rejecting God's existence; all that one is committed to thereby is that there really are no sins.)

1.2 Theological voluntarism and moral skepticism

Call a 'moral skeptic' one who disbelieves or withholds judgment on the claim that any normative state of affairs obtains. One can affirm metaethical theological voluntarism while being a moral skeptic; one cannot affirm normative theological voluntarism while being a moral skeptic. A metaethical theological voluntarist might claim that no normative state of affairs could be made to obtain without certain acts of divine will, but because there is no God, or because there is a God that has not performed the requisite acts of will, no normative states of affairs obtain. A normative theological voluntarist cannot, however, be a moral skeptic. Because the normative theological voluntarist is committed to the obtaining of at least one normative state of affairs -- for example, *its being obligatory to obey God* -- the conjunction of moral skepticism and normative theological voluntarism is not a coherent combination of views.

My concern in the rest of this article will be with the metaethical version of theological voluntarism; any further references to theological voluntarism are, unless otherwise noted, to the metaethical version of the position. Theological voluntarism thus understood is consistent either with the affirmation or with the denial of theism and moral skepticism. Taking a negative stand on theism or a positive stand on moral skepticism should not prevent one from taking seriously theological voluntarism as a philosophical position. This is an important point, because it is often thought that theological voluntarism is only for theists, or only for moral nonskeptics. While it is true that some of the arguments for theological voluntarism take theism, or the existence of moral obligations, as premises, not all of them do.

2. Metaethical theological voluntarism

Metaethics is concerned with the formulation of interesting and informative accounts of normative concepts, properties, and states of affairs; and a metaethics that is a version of theological voluntarism will formulate such accounts in terms of some acts of divine will. This statement of the position is highly abstract, but it cannot be made less abstract without making difficult choices among rival formulations of the view.

2.1 Considerations in Favor

The considerations to be offered in favor of theological voluntarism are, at this level, similarly abstract. I

will discuss three types of consideration: *historical*, *theological*, and *metaethical*.

Historical considerations in favor of theological voluntarism

Some of the considerations in favor of metaethical theological voluntarism are historical. Both theists and nontheists have been impressed by the extent to which at least some moral concepts developed in tandem with theological concepts, and it may therefore be the case that there could be no adequate explication of some moral concepts without appeal to theological ones. On this view, it is not merely historical accident that at least some moral concepts had their origin in contexts of theistic belief and practice; rather, these concepts have their origin essentially in such contexts, and become distorted and unintelligible when exported from those contexts (see, for example, Anscombe 1958).

Theological considerations in favor of theological voluntarism

Some of the considerations in favor of theological voluntarism have their source in matters regarding the divine nature. Several such arguments are summarized in Idziak 1979 (pp. 8-10). Some appeal to *omnipotence*: since God is both omnipotent and impeccable, theological voluntarism must be true: for if God cannot act in a way that is morally wrong, then God's power would be limited by other normative states of affairs were theological voluntarism not the case. Some appeal to God's *freedom*: since God is free and impeccable, theological voluntarism must be true: for if moral requirements existed prior to God's willing them, requirements that an impeccable God could not violate, God's liberty would be compromised. Some appeal to God's status as supremely *lovable* and *deserving of allegiance*: if theism is true, then the world of value must be a theocentric one, and so any moral view that does not place God at its center is bound to be inadequate. Even if individually insufficient as justifications for adopting theological voluntarism, collectively they may suggest some desiderata for a moral view: that God must be at the center of a moral theory, and, in particular, that the realm of the moral must be dependent on God's free choices. It seems that any moral theory that met these desiderata would count as a version of theological voluntarism.

Metaethical considerations in favor of theological voluntarism

A third set of considerations in favor of theological voluntarism has its source in metaethics proper, in the attempt to provide adequate philosophical accounts of the various formal features exhibited by moral concepts, properties, and states of affairs. One might claim, that is, that theological voluntarism makes the best sense of the formal features of morality that both theists and nontheists acknowledge.

Consider first the *normativity* of morals. Both theists and nontheists have been impressed by the weirdness of normativity, with its very otherness, and have thought that whatever we say about normativity, it will have to be a story not about natural properties but nonnatural ones (cf. Moore 1903, section 13). John Mackie, an atheist, and George Mavrodes, a theist, have both drawn from this the same moral: if there is a God, then the normativity of morality can be understood in theistic terms; otherwise, the normativity of morality is unintelligible (Mavrodes 1986; Mackie 1977, p. 48). As Robert Adams has

suggested, given the serious difficulties present in understanding morality as a natural property, it is worthwhile taking seriously the hypothesis that morality is not just a nonnatural matter but a supernatural one (Adams 1973, p. 105). For the standard objections against understanding normativity as a nonnatural property concern our inability to say anything further about that nonnatural property itself and about our ability to grasp that property (see, e.g., Smith 1994, pp. 21-25). But if morality is to be understood in terms of God's commands, we can give an informative account of what these unusual properties are; and if it is understood in terms of God's commands, then we can give an informative account of how God, being the creator and sustainer of us rational beings, can ensure that we can have an adequate epistemic grasp of the moral domain (Adams 1979a, pp. 137-138).

Consider next the *impartiality* of morals. The domain of the moral, unlike the domain of value generally, is governed by the requirements of impartiality. To use Sidgwick's phrase, the point of view of morality is not one's personal point of view but rather "the point of view … of the Universe" (Sidgwick 1907, p. 382). But, to remark on the perfectly obvious, the Universe does not have a point of view. Various writers have employed fictions to try to provide some sense to this idea: Smith's impartial and benevolent spectator, Firth's ideal observer, and Rawls' contractors who see the world *sub specie aeternitatis* come to mind most immediately (Smith 1759, Pt III, Ch 8; Firth 1958; and Rawls 1971, p. 587). But theological voluntarism can provide a straightforward understanding of the impartiality of morals by appealing to the claim that the demands of morality arise from the demands of someone who in fact has an impartial and supremely deep love for all of the beings that are morality's proper objects.

Consider next the *overridingness* of morals. The domain of the moral, it is commonly thought, consists in a range of values that can demand absolute allegiance, in the sense that it is never reasonable to act contrary to what those values finally require. One deep difficulty with this view, formulated in a number of ways but perhaps most memorably by Sidgwick (1907, pp. 497-509), is that it is hard to see how moral value automatically trumps other kinds of value (e.g. prudential value) when they conflict. But if the domain of the moral is to be understood in terms of the will of a being who can make it possible that, or even ensure that, the balance of reasons is always in favor of acting in accordance with the moral demand, then the overridingness of morals becomes far easier to explain.

Consider next the *content* of morals. There is a strong case to be made that moral judgments cannot have just any content: they must be concerned, somehow, with what exhibits respect for certain beings, or with what promotes their interests (cf. Foot 1958, pp. 510-512; Smith 1994, p. 40). Theological voluntarism has a ready explanation for the content of morals being what it is: it is that moral demands arise from a being that loves that being's creation.

So there are some general reasons to think theological voluntarism promising. The reasons are stronger yet when one is proceeding from theistic starting points. (This is not trivial, since a number of theistic philosophers reject theological voluntarism.) But these reasons, while suggestive, are rather generic: they point to the promise possessed by theological voluntarism, though they do not fix for us on a particular formulation of the view. The general schema for a particular theological voluntarist position is 'evaluative status *M* stands in dependence relation *D* to divine act *A*' (cf. Quinn 1999, p. 53, which I follow here except to substitute the more general 'evaluative' for Quinn's more specific 'moral'). So

there are at least three choices that have to be made. We need to say something about what sorts of evaluative statuses depend on God's will. We need to say something about what are the relevant acts of divine will. And we need to say something about what the dependence relation is supposed to be. (These are not independent questions, of course.)

2.2 Which evaluative statuses?

A metaethical view can be more or less comprehensive, aiming to cover more or fewer evaluative statuses. A metaethical view might claim to provide an account of all evaluative notions, or of all normative notions, or of all moral notions, or or some set of moral notions. (Roughly, and taking the notion of an evaluative property as fundamental: for a notion to be normative is for it to be a certain sort of evaluative notion, one that is essentially action-guiding; for a notion to be moral is for it to be a certain sort of normative notion, one that exhibits impartiality.) No one claims that theological voluntarism provides an account of all evaluative notions. The real contenders are the latter three.

There are good reasons to reject the claim that all normative notions are to be understood in relation to God's will. The main reason is that, as we will see below, it is important that there be items with normative statuses independent of God's will in order to explain how God's will, even if free, is not arbitrary. And it is not as if the view that some normative statuses are not to be explained in terms of God's will must be repugnant to a theocentric metaethics: for, after all, one might understand such statuses in theological, even if not voluntaristic, terms. Adams, for example, understands some notions of goodness in terms of likeness to God, an understanding that is unquestionably theocentric though not voluntaristic (Adams 1999, pp. 28-38).

Most of the current debate over the evaluative statuses to be explained by theological voluntarism, then, concerns whether the entire set or only some proper subset of moral statuses is to be understood in both theological and voluntaristic terms. Quinn (1978) offers a theological voluntarist view on which all moral statuses are to be understood in terms of God's will. But Adams rejects this view, and Quinn, following Adams and Alston (1990), now rejects it as well. These writers hold that only moral properties in the "obligation family," properties like those of *being obligatory*, *being permissible*, *being required*, and *being right* (where *being right* involves a constraint on conduct, rather than being merely fitting), are to be understood in theological voluntarist terms. Call their view the *restricted* moral view; call the view that all moral statuses are to be understood in voluntarist terms the *unrestricted* moral view.

The restricted moral view has been defended with more and less impressive arguments. The less impressive arguments are those that appeal to the idea that there must be moral properties that are not explained in terms of God's will in order to deal with some of the classic objections to theological voluntarism. To preserve the notion that God is good, one might say, we need to restrict the aspirations of theological voluntarism to those of explaining a proper subset of moral notions, leaving the remainder for an account of God's goodness; or, to make intelligible the commands that God chooses to give, we need to set aside some group of moral notions to be explained in other than theological voluntarist terms and that can therefore enter into our account of the intelligibility of God's choices to give certain

commands rather than others. But these considerations are not, after all, entirely persuasive. For one might well explain the notion that God is good and account for the intelligibility of divine commands by appeal to normative notions that are nonmoral. (See Section 3 below for further discussion of these arguments.)

More plausible are arguments that suggest that there is something in particular about obligation that makes it fit for a theological voluntarist explanation, some feature that is not shared with notions like moral virtue and moral good. Adams suggests, with some plausibility, that the notion of obligation is ineliminably social, that it must involve a relationship between persons, a relationship in which a demand is made (Adams 1987b, p. 264; also Adams 1999, pp. 245-246). This feature of obligation makes it different from notions of goodness and virtue, which do not seem to have this essentially social element. That obligation is special in this way does not, of course, show that notions of moral virtue and moral goodness do not also need to be treated in a theological voluntarist way. It could be that even if obligation most obviously requires this treatment, the points made earlier about the promise of theological voluntarism also extend to other moral notions, even if in a less pressing way. (See the Section 3.3 below for further discussion, and evaluation, of this point.)

There are at present no decisive reasons for the theological voluntarist to adhere to either the restricted or the unrestricted moral view. But theological voluntarists want to say that at least that the properties in the obligation family are to be accounted for in terms of this view. In the remainder of this article, it will be assumed that theological voluntarism is about properties in the obligation family, though we will occasionally consider how the view could be extended to other moral properties as well.

2.3 Which act of divine will?

Assume, then, that theological voluntarism is an account of obligation-type properties. A second issue concerning the proper formulation of the view concerns the relevant act of divine will. Is the requisite act of divine will is to be understood as an act of commanding, or instead as some mental act like choosing, intending, preferring, or wishing? And if one holds that the act of the divine will is a mental act, should the mental act to which the theological voluntarist appeals in order to account for obligation be one whose object is the action that is made obligatory, or one whose object is the state of affairs that the action is obligatory? We have, to simplify matters, three options:

> (1) That it is obligatory for *A* to ϕ depends on God's commanding *A* to ϕ.
>
> (2) That it is obligatory for *A* to ϕ depends on God's willing that *A* ϕ.
>
> (3) That it is obligatory for *A* to ϕ depends on God's willing that it be obligatory for *A* to ϕ.

One might think that the central issue here would be to decide between the speech-act view (1) and the mental acts views (2) and (3); it might be thought to be less important, an issue of intramural interest

only, to decide between (2) and (3). But this is not right. The important debate is between (1) and (2). For (3) is, understood in one way, no competitor with either (1) or (2); and understood differently, it has little argumentative support.

The dispute between (1) and (2).

There is an ongoing debate whether (1) or (2) is the better formulation of theological voluntarism about obligation. There are initially plausible points on both sides of the issue. In favor of (1), one might appeal to the centrality of the image of God as commander in the Abramic faiths. In favor of (2), one might appeal to the centrality to theistic belief and practice of the idea that doing God's will is the standard for the moral life.

With only these initial points, there can be no resolution, and so defenders of these two formulations of theological voluntarism have sought other argumentative routes. One might try to reduce (2) to absurdity. One who is rational does not intend what one knows will not happen; and, on the orthodox conception of God, God is both rational and omniscient. This entails that God will never intend something that will not happen. If obligation arises from divine intentions, though, then no obligations will ever be violated. Since this is absurd, one should prefer (1) over (2). But defenders of (2) have a plausible response. First, defenders of (1) are in no better a position than defenders of (2). For it is a sincerity condition on the giving of commands that the commander intend that the commanded perform the action; and so if this objection reduces (2) to absurdity, the only way that the defender of (1) can avoid having his or her position reduced to absurdity is by holding that God is not necessarily sincere. Second, the notion of intention admits of various readings, and there is a reading of intention suitable for theological voluntarism that does not have the untoward result that no created rational beings could ever act contrary to a divine intention. It is standard to distinguish between God's *antecedent* and God's *consequent* will: God's consequent will is God's will absolutely considered, as bearing on all actual circumstances; God's antecedent will is God's will considered with respect to some proper subset of actual circumstances. (To use an example of Aquinas's, one drawn from the discussion in which the distinction between antecedent and consequent will is made [*Summa Theologiae*, Ia, Q. 19, A. 6]: while in one way God wills that all persons be saved, in another way God does not will that all be saved; indeed, God wills that some persons be damned. What makes this coherent is that the sense of willing in which God wills that all be saved is antecedent: prior to a consideration of all of the particulars of persons' situations, God wills their salvation; but in light of all of the particulars of persons' situations -- including the circumstance that some persons have willingly rejected friendship with God -- God wills their damnation.) So while there is a sense in which it is true that all that God intends must come to pass, this sense is that of consequent intending rather than antecedent intending. On (2), then, one can say that the theological voluntarist holds that obligation depends on certain of God's *antecedent* intentions. (See also Murphy 1998, pp. 17-21.)

We might ask, in order to bring the differences between these views better out into the light, what our considered opinion is in cases in which a divine antecedent intention that $A \wp$ and a divine command that $A \wp$ pull apart. It is far from clear that it is a real option for God to command that $A \wp$ while not intending that $A \wp$. Though this possibility is endorsed by Wierenga 1983 (p. 390) and is at least

entertained in Murphy 1998 (p. 9), for God to issue such a command would be for God to command insincerely -- something that many would be loath to allow. (See also Adams 1999, p. 260 and Murphy 2002, 2.5) But the other option appears unproblematic enough. God might intend for humans to act a certain way while not commanding them to do so. In such a scenario, one might ask, is obligation engendered? If yes, then it seems to count in favor of the divine will view (2); if no, then it seems to count in favor of the divine command view (1).

Adams claims that obligations are not engendered in such cases; actually made demands are necessary. He offers three reasons for preferring the command conception in these cases. The first is that holding that obligation is a matter of divine command rather than divine will makes possible a distinction between the obligatory and the supererogatory: we can say that while God's commands somehow makes certain acts obligatory, if God does will that we perform some act but does not command it, performing that act is supererogatory. The second is an appeal to the idea that theological voluntarism is a social conception of obligation: obligation arises in the context of the social relationship between God and created rational beings. (Not all versions of theological voluntarism affirm this; see the discussion of (3) below.) But, Adams says, in social relationships obligations arise only when demands are actually made. And the third reason is that there is something unsavory about obligations allegedly resulting from an act of divine will that is not expressed as a command: “Games in which one party incurs guilt for failing to guess the unexpressed wishes of the other party are not nice games. They are no nicer if God is thought of as a party to them” (Adams 1999, p. 261).

But the defender of the divine will view (2) has some responses available. The defender of this view can say, with respect to the first point, that a divine will view can capture the difference between the obligatory and the supererogatory not by appeal to the difference between acts of divine will that are expressed as commands and those that are not but rather as a difference between distinct types of act of divine will: the difference, say, between what God intends that we do and what God merely prefers that we do (cf. Quinn 1999, p. 56). With respect to the second and third points, the defender of the divine will view can directly challenge Adams' view that obligations generated within social relationships must always be expressed as demands. Spouses, for example, often take themselves to be obligated by what their spouses intend with respect to their behavior; indeed, it would be unseemly to hold oneself to be bound by one's spouse's will only if the spouse has actually made a demand on one. (“How can you blame me for not helping you empty the dishwasher? You didn't tell me to!” does not often go over well.) One often wants another to perform some action without being told to; many actions have their value only through being performed without being prompted by a command. But, on (1), no act of the form ‘φ*-ing*, though God has not told me to φ’ could ever be obligatory.

Here is a thought experiment that may help to decide the dispute between these two camps. For it to be possible for one to give another a command to φ, there must be a linguistic practice available to the addressee in terms of which the speaker can formulate a command. This is not just for the sake of having the means to communicate a command: rather, commands are essentially linguistic items, and cannot be defined except in such terms. Imagine, though, that a certain created rational being, Mary, inhabits a linguistic community in which there is no practice of commanding. One can successfully make assertions to Mary, and among these assertions can be assertions about one's own psychological states, but one

cannot successfully command Mary to do anything. Here is the question: so long as Mary's linguistic resources are confined to those afforded by this practice, can God impose obligations on her? The defender of (1) will have to say No: for Mary cannot be commanded to do anything. The defender of (2) will have to say Yes: God could have an antecedent intention that Mary perform some action and (to sidestep worries about being under an obligation that one cannot know about) could inform Mary that God has that intention with respect to her conduct.

The debate between defenders of (1) and defenders of (2) is ongoing, and at present far from conclusive.

Option (3).

The other formulation of theological voluntarism that we noted is that in which the act of divine will is that of willing that the state of affairs that it is obligatory for *A* to $\wp$ obtain. Unlike the formulations (1) and (2), which admit of various sorts of dependence relationship between the act of divine will and the obligation, (3) is limited to something like a causal picture. (It obviously could not be that *its being obligatory for A to* $\wp$ is identical to *God's willing that it be obligatory for A to* $\wp$, on pain of a vicious regress.) The idea expressed here is that ultimately all obligations are present because of efficacious acts of the divine will, in particular, acts of willing that those obligations be in force.

This account is compatible with (1) and (2), because it could be that the way that God makes it the case that an act is obligatory is necessarily through the giving of commands (as in (1)) or through antecedently intending (as in (2)) the performance of that action. So it is not really, in its most general form, a *competitor* to (1) and (2). It could be made a competitor by adding claims about the way that the divine will brings it about that these obligations obtain. A defender of (3) might add that on his or her view the divine intention that *A* be obligated to $\wp$ is the immediate, total, and exclusive cause of its being obligatory for *A* to $\wp$ (cf. Quinn 1999, p. 55). If so, then a divine command that *A* $\wp$ or a divine antecedent intention that *A* $\wp$ could not be partial or mediate causes of its being obligatory for *A* to $\wp$. But note that even thus strengthened (3) is compatible with (1) or (2) understood as an identity claim: if the claim is that obligations just are divine commands or divine intentions, then the compatibility with (1) and (2) is reestablished.

Even if it turns out that (3) is not an obvious competitor with (1) and (2), it is still worth asking whether it is true. Quinn no longer is concerned to defend it, but he once argued for it in terms of an argument from divine sovereignty: because every state of affairs that obtains that does not involve God's existing depends on God's will, a fortiori every normative state of affairs that does not involve God's existing depends on God's will. (Quinn thought that *its being obligatory to obey God* is a state of affairs that involves God [Quinn 1990, pp. 298-299], but for a reason to reject that claim see Murphy 1998, pp. 12-13.) It does not seem, though, that this argument would support (3) in the strengthened version that holds that the dependence must be immediate, total, and exclusive. After all, very few folks want to say that every state of affairs that is brought about by God's will is brought about by God's will exclusively, totally, and immediately. While it is plausibly part of theism that every state of affairs that obtains, apart from those that involve God, is somehow dependent on God's will, this does not show that deontic states

of affairs are more interestingly connected to the divine will than states of affairs involving mathematics, or physics, or accounting (Murphy 1998, pp. 14-16).

We may put (3) to the side, then. While some formulations of it may very well be true, those formulations for which there is argumentative support do not establish much in the way of interesting metaethical conclusions. The debate concerning whether (1) and (2) is the more adequate formulation of theological voluntarism is ongoing, and we should thus proceed in a way that is as far as possible neutral between the two (though admittedly unwieldy) by saying that *A*s moral obligations to φ depend on God's commands/intentions that *A* φ. (By 'intentions' I will mean antecedent intentions.) Allowing for both of these possibilities, what can be said about the relationship of dependence holding between divine commands/intentions and moral obligations?

2.4 What sort of dependence?

The third issue that must be dealt with in providing a formulation of theological voluntarism is that of the specification of the dependence relationship that holds between divine commands/intentions that A φ and the moral obligation of *A* to φ. There have been several options considered whose nature and merits are worth discussing here. On an *analysis* view, it is part of the meaning of 'it is morally obligatory for *A* to φ' that God commands/intends that *A* φ. On a *reduction* view, the state of affairs *its being obligatory for A to* φ is the state of affairs *God's commanding/intending that A* φ. On a *supervenience* view, *its being obligatory for A* to φ supervenes on *God's commanding/intending that A* φ On a causal view, necessarily, *its being obligatory for A* to φ is caused by *God's commanding/intending that A* φ, and necessarily, *God's commanding/intending that A* φ causes it to be obligatory for *A* to φ.

Causation

The causal view is defended by Quinn (1979, 1990, 1999), and in a particularly strong form: on Quinn's view, the causal connection between *God's antecedently intending that A* φ and *its being obligatory for A to* φ exhibits totality, exclusivity, activity, immediacy, and necessity.

There are at least three serious difficulties for the causation formulation. The first we may call the 'Humean worry'. Once we allow that *its being morally obligatory to* φ is distinct from *God's commanding/intending* φ*-ing*, there is the question of what reason we would have for thinking that *its being morally obligatory to* φ necessarily obtains if *God's commanding/intending* φ*-ing* obtains. And whatever answer the defender of this view offers, it must be consistent with the causation formulation of theological voluntarism. But it is unclear what would do the trick. One way to try to make this necessary connection is by holding that there is a prior moral obligation to obey God; and so, whenever God gives a command/has an intention that one perform some action, it follows that one is morally obligated to perform the action commanded/intended. But we cannot take this route, because if the causation formulation is correct, then *all* moral obligations are caused entirely by God's commanding/intending activity; there cannot be, then, this *prior* moral obligation to obey God that would serve as part of the *explanans* for the necessary connection between divine commands/intentions and moral obligations.

The causal view that is a version of (2) (that is, that *its being obligatory for A* to φ depends causally on *God's willing that A* φ) should be distinguished carefully from the causal view that is a version of (3) (that is, that *its being obligatory for A to* φ depends causally on *God's willing that it be obligatory for A to* φ). The causal formulation of (3) has at least some plausibility as a result of God's sovereignty and omnipotence -- though it is in the end unclear why we should move from the claim that God is the ultimate source of all being to the claim that, for all deontic states of affairs, God's willing that that deontic state of affairs obtain is the *immediate*, *total*, and *exclusive* cause of its obtaining. Most of us would not, after all, find intuitively compelling a move from the claim that God is ultimate source of all being to the claim that, for all *physical* states of affairs, God's willing that that physical state of affairs obtain is the immediate, total, and exclusive cause of its obtaining. The causal view as an instance of (2), though, seems to have even less in the way of argumentative support. Why would one think that God's intending that *A* φ is an immediate, total, and exclusive cause of a deontic state of affairs' obtaining? In the absence of some evidence for such a connection, it is hard to see why one would be attracted to this formulation of theological voluntarism.

The second worry about the causal formulation I will call the ‘lack of precedent worry’. Moral properties and states of affairs supervene on nonmoral properties and states of affairs. The intuitive idea is that there can be no differences in moral status without some difference in nonmoral status. The causal formulation satisfies the supervenience constraint -- the differences in nonmoral status concern God's commands/intentions -- but it does so in a way that is unprecedented and mysterious. When we look at the specific ways in which changes in nonmoral facts can make a difference to the moral facts that hold, there is a pretty limited number of intelligible relationships that can hold between these nonmoral facts and the moral facts that supervene on them. A nonmoral fact can be part of what constitutes a reason to perform an action. (That you promised to φ can be cited in explaining why you have a reason to φ; your promising to φ constitutes, at least in part, the reason that you have to φ.) It can be part of an enabling condition for that reason. (The existence of a social practice of promising can be cited in explaining why you have a reason to φ; the existence of that practice might explain why your promise has the reason-giving force that it has.) It can be cited as a defeater-defeater for a reason. (While the fact the promisee told you that you need not fulfill your promise to φ typically releases you from your promise to φ, the fact that you threatened to beat up the promisee if he or she did not tell you that you need not fulfill your promise invalidates that release, and can be cited in explaining why you have a reason to φ.) But while theological voluntarism holds that a fact -- the fact that God commands/intends that one φ -- explains why one has a reason (in this case, an obligation) to φ, the causal view holds that this fact falls into none of the familiar explanatory categories: it is not constitutive of the reason, it is not an enabling condition for the reason, it is not a defeater-defeater for the reason. The way that the fact is supposed to explain the reason is *merely causal*: it just brings the reason about, exclusively, totally, immediately. This is an entirely unfamiliar phenomenon: nowhere else do we encounter a merely causal connection between a nonmoral fact and a moral one. (The appeal to the very strangeness of divine causation itself is not sufficient to answer the objection. For there is an extra strangeness here: that the relationship between nonmoral and moral facts is in every case with which we are familiar a rational relationship, whereas on the causal formulation of theological voluntarism the relationship is merely causal. Creation *ex nihilo* does not constitute carte blanche to multiply strangenesses.)

The third worry is the ‘no authority worry’. Theological voluntarism can be defended on the basis of considerations proper to metaethics -- that, for example, theological voluntarism provides the best explanation for the impartiality of morals, or for its overridingness, or for its normativity, or for its content. But theological voluntarists have tended to argue that theological voluntarism has something specific to offer to theists. One of these benefits on offer is that theological voluntarism fits well with the centrality of the virtue of obedience in theistic thought and practice (Quinn 1992, p. 510; Adams 1973, pp. 99-103). God is a being who is *to be obeyed*, is someone who is a *practical authority* over us.

For one to be a practical authority over another is, at least, for one to have some sort of control over others' reasons for action. Whatever else practical authority is, it is the ability to make a difference with respect to someone's reasons to act. The control involved in practical authority is, however, of a specific sort: it is *constitutive* control. When a party is an authority over another, his or her dictates constitute, at least in part, reasons for action for that other. (One piece of evidence for this is that when we take *A* to be an authority over us, we will cite ‘*A* told us to’ as a reason for action.) But if God's commands to φ have merely causal power to bring about obligations to φ, then the resultant state of affairs that is the reason for action is *its being obligatory to* φ -- a state of affairs that need not be in any way constituted by God's issuing any commands. No version of theological voluntarism that is built simply around God's causal role in actualizing moral obligations implies that God is a practical authority. (See Murphy 2002, 4.3.)

Supervenience

Suppose that we continue to interpret supervenience intuitively as the no-difference-in-moral-properties-without-some-difference-in-nonmoral-properties thesis. We can see very quickly that the theological voluntarist has to say something more about the sort of supervenience he or she has in mind in order to present what is genuinely a theological voluntarist account of moral obligation. For suppose that one puts forward a view on which both of the following claims are true: the moral law does not depend on, nor is it identical with, God's commands; but God necessarily commands us to follow the moral law. While it is obvious is that this not a version of theological voluntarism at all -- moral obligation in no way depends on divine command -- it satisfies the intuitive description of what is involved in the supervenience of the moral on the nonmoral: for there could be, on this view, no differences in moral status without some difference in divine commands. So if one is to put forward a supervenience formulation of theological voluntarism, then one will have to either be a little bit more doctrinaire about the supervenience relationship, so that it will exclude the nonvoluntarist view just described, or one will have to say more than that moral obligations supervene on divine commands. For our purposes here, they come to the same thing: that there is something more to the supervenience formulation of theological voluntarism than the claim that there are no differences in agents' moral obligations without some differences in the divine commands that have been imposed on that agent.

What is called for here is, pretty obviously, just some particular relationship of ontological dependence. It will not be that of causation, for reasons we have already examined. But neither does the defender of the supervenience view want it to be the extreme dependence of moral obligations on divine commands affirmed by the reduction formulation, on which moral obligations *just are* divine commands. To avoid

collapse into the reduction formulation, it has to hold that moral obligations are distinct from divine commands. It can make this distinction in one of two ways. It could say that moral obligation is wholly distinct from divine command -- that is, that the state of affairs *its being morally obligatory* to φ is not constituted even in part by *God's commanding φ-ing*. Or it could say that moral obligation is only partially constituted by divine command -- that is, that the state of affairs *its being obligatory to φ*, while not identical with *God's commanding φ-ing*, includes the state of affairs *God's commanding φ-ing* (and some other state of affairs besides). Let us consider each of these possibilities in turn.

Suppose first that the defender of the supervenience view affirms that moral obligation is wholly distinct from divine command. If so, then all of the arguments that were raised against the causation formulation can be leveled against the supervenience view. The no authority issue will arise. Because the states of affairs *its being obligatory to φ* and *God's commanding φ-ing* will be distinct, the supervenience account lacks the resources to underwrite divine authority. For God is authoritative only if God's commands are themselves reasons for action, but if the states of affairs *its being obligatory to φ* and *God's commanding φ-ing* are distinct, then God's commands will not be themselves reasons for action on the adequately strengthened supervenience view. And if these commands are not themselves reasons for action, then God does not constitutively actualize reasons for action by His commands; and if God does not constitutively actualize reasons for action by His commands, then God is not authoritative. The lack of precedent issue will arise. For the adequately strengthened supervenience view cannot view obligations as constituted by divine commands, and no theological voluntarist worthy of the name will see God's commands as merely enablers or defeater-defeaters for obligations; and so the relationship between divine commands and moral obligations is bound to be unprecedented and mysterious. And the Humean issue will arise. For the causation view is, after all, just the adequately strengthened supervenience view plus the claim that the dependence relationship involved in a particular sort of causal dependence. So, understood as affirming a dependence relationship between wholly distinct moral obligations and divine commands, the supervenience view has all of the problems of the causation view.

So the only hope for the supervenience formulation is to hold that God's commands are proper parts of moral obligations: for if those commands are identical with moral obligations, then the supervenience view collapses into the reduction view, and if moral obligations are wholly distinct from divine commands, then the supervenience view fails for the reasons that the causation view fails. There are, however, serious difficulties for this partial constitution version: in particular, if one is committed to saying that *God's commanding φ-ing* partly constitutes *its being morally obligatory to φ*, it is hard to see what state of affairs the theological voluntarist would be tempted to say is also necessary for moral obligation to be fully constituted. Obviously this other state of affairs cannot be one that involves moral obligation, on pain of circularity. (So, the theological voluntarist cannot say that *its being morally obligatory to φ* just is the complex state of affairs consisting both of *God's commanding φ-ing* and *its being morally obligatory to do what God commands*.) Further, in order to remain faithful to the basic idea of the supervenience version, we would have to say that any state of affairs that is held to constitute *its being morally obligatory to φ* along with *God's commanding φ-ing* must be a state of affairs that is certain to obtain if *God's commanding φ-ing* obtains. Otherwise, it might be the case that *its being morally obligatory to φ* does not supervene on *God's commanding φ-ing*, for there would be two possible worlds, in both of which *God's commanding φ-ing* obtains, but in only one of which does *its*

being morally obligatory to φ obtain. This runs contrary to even the basic idea of the supervenience view, on which there are no differences in moral obligations without a difference in divine commands.

These limitations make it hard to imagine what a motivated version of this form of the supervenience view would look like. We have to imagine a view of the following form. It is nonnegotiable that the state of affairs *its being morally obligatory to* φ is partially constituted by *God's commanding* φ*-ing*. It is nonnegotiable that there is, apart from *God's commanding* φ*-ing*, at least one state of affairs S that partially constituted *its being morally obligatory to* φ. It is nonnegotiable that S either obtains necessarily or at the very least necessarily obtains if *God's commanding* φ*-ing* obtains (otherwise moral obligation would not supervene on divine command). And it is nonnegotiable that S not involve moral obligation. The only remotely plausible candidates for S that come to mind are normative states of affairs that fall short of the obligatory, for example, φ*-ing's being good* (or *virtuous*, or *praiseworthy*). One might say, for example, that *its being morally obligatory to* φ is constituted jointly by *God's commanding* φ*-ing* and φ*-ing's being virtuous*. But it is unclear what motivation one would have for affirming such a position. It cannot be for the sake of making sure that God cannot impose a moral obligation to do something that is not virtuous: for, ex hypothesi, we know already that φ*-ing's being virtuous* obtains whenever *God's commanding* φ*-ing* obtains, for otherwise *its being morally obligatory to* φ would not supervene on *God's commanding* φ*-ing*.

The difficulty that faces the defender of the supervenience view can be framed as a dilemma. If the defender of that view holds that the state of affairs *its being morally obligatory to* φ is wholly distinct from *God's commanding* φ*-ing*, then he or she is refuted by the considerations that refute the causation view. If, on the other hand, the defender of the supervenience view holds that the state of affairs *its being morally obligatory to* φ is partially but not wholly constituted by *God's commanding* φ*-ing*, then there is pressure to explain why he or she does not simply affirm the reduction view, on which *its being morally obligatory to* φ just is *God's commanding* φ*-ing*. Unless the defender of the supervenience view identifies the state of affairs that, in addition to *God's commanding* φ*-ing*, makes for a moral obligation to φ, then his or her unwillingness to adopt the reduction view will look unmotivated and arbitrary.

Analysis

According to the analysis view, defended in Adams 1973, the concept of the morally obligatory is to be analyzed as that of being commanded by a loving God. Adams did not put this view forward as an account of the meaning of 'obligation' generally, but only of its meaning as employed in Judeo-Christian moral discourse. As evidence for this analysis, Adams appealed to the freedom with which users of that discourse moved between claims of the form '*x* is obligatory' and '*x* is God's will' or '*x* is God's command.'

There are a couple of central difficulties for this position. The first is that it seems to imply that those inside and those outside the Judeo-Christian practice of moral discourse have never disagreed when one has affirmed a claim of the form ' φ-ing is obligatory' and the other denied a claim of that form. For they do not, on Adams' account, mean the same thing when they use these terms. In atheistic moral

discourse, a masterful user of the language can say ‘it is not true that God has commanded φ-ing, but φ-ing is nonetheless obligatory’; in Judeo-Christian moral discourse, on Adams' view, one shows oneself to be either unintelligible or not a masterful user of moral language if one were to speak thus. Adams was aware of this difficulty, and attempted to mitigate it: he argued that the agreement over which items the term ‘obligatory’ applied to, and the appropriate attitudinal and volitional responses to those things correctly described as ‘obligatory,’ made possible substantive moral discourse (Adams 1973, pp. 116-120). But all this seems to do is to explain how a simulacrum of genuine moral discourse is preserved; it does not show that what we get is the real thing.

The second difficulty is that of dealing with those within the Judeo-Christian tradition of moral discourse who employed or continue to employ moral language in a way that is out of step with Adams' analysis. Now, it is not sufficient to refute a suggested analysis of some term that users of that term have questioned or even rejected that analysis. But if we take the task of analyzing terms to be that of making explicit and systematizing the platitudes employing that term affirmed by masterful users of that term (Smith 1994, pp. 29-32), and we note that many thoughtful Jews and Christians who otherwise appear to be masterful users of the language of moral obligation have rejected, either explicitly or implicitly, the notion that an act is obligatory if and only if it has been commanded by God, then we would have some reason to doubt whether the analysis formulation of theological voluntarism is defensible.

Reduction

Adams' maneuver in the face of these difficulties was to move from the analysis to the reduction version of theological voluntarism. He decided that the meaning of the term ‘morally obligatory’ was common to theists and nontheists. There is a common concept of the morally obligatory, a common concept that makes possible substantive agreement and disagreement between theists and nontheists. This common concept is neutral between theism and nontheism. But, following the now standard Kripke-Putnam line, Adams affirms that there are necessary a posteriori truths, among which are included property identifications. He argued that the property *being wrong* is identical to the property *being contrary to the commands of (a loving) God* because the property *being contrary to the commands of (a loving) God* best fills the role assigned by the concept of wrongness (Adams 1979a, pp. 133-142; see also Adams 1999, pp. 252-258). By conceptual analysis alone we can know only that wrongness is a property of actions (and perhaps intentions and attitudes); that people are generally opposed to what they regard as wrong; that wrongness is a reason, perhaps a conclusive reason, for opposing an act; and that there are certain acts (e.g. torture for fun) that are wrong. But given traditional theistic beliefs, the best candidate property to fill the role set by the concept of wrongness is that of being contrary to (a loving) God's commands. For that property is an objective property of actions. Further, given Christian views about the content of God's commands, this identification fits well with widespread pre-theoretical intuitions about wrongness; and given Christian views about human receptivity to divine communication and God's willingness to communicate both naturally and supernaturally, God's commands have a causal role in our acquisition of moral knowledge (Adams 1979, p. 139; see also Adams 1999, pp. 257).

The reduction formulation avoids the most troublesome implications of the analysis formulation, for it allows that there is a common concept of obligation, so that those within the Judeo-Christian tradition

and those outside it can engage in moral debate and can have substantive agreements and disagreements with each other, and so that those within the Judeo-Christian tradition can raise substantive questions about the relationship between God and obligation without ipso facto excluding themselves from the class of masterful users of the moral concepts of that community. The reduction formulation allows that the concept of obligation may be nontheistic while the property that best fills the role assigned to it by that concept is a theistic one.

Analysis vs. reduction.

Nevertheless, it remains an open question whether the reduction view is superior to the analysis view. One might argue that Adams' analogy to ‘H_2O is water’ is inappropriate, as the identification with water with H_2O is clearly a posteriori, whereas the identification of the morally obligatory with the commanded by God is a priori. For if Adams is right in his characterization of the concept of obligation, it is not as if those who do not have the ability to infer from ‘this is morally obligatory’ to ‘this is commanded by a loving God’ (and vice versa) are just missing out on an interesting extra fact, the way that those without rudimentary chemistry are missing out on an interesting extra fact if they do not know that water is H_2O. The term ‘water’ can play its role in our practical lives perfectly well without our knowing that it is H_2O. The term ‘morally obligatory’ cannot play its role in our practical lives without our knowing that the morally obligatory is the commanded by God. No unintelligibility creeps into the life of agents that do not grasp that water is H_2O; unintelligibility creeps into the life of agents that do not grasp that the morally obligatory is what is commanded by God.

Why might one think that the masterful use of ‘morally obligatory’ requires recognition that the morally obligatory is what is commanded by God? If Adams is right, it is part of the meaning of obligation that obligations are social in character (Adams 1999, p. 233) and involve actually made demands by one party in the social relationship on another (Adams 1999, pp. 245-246). It is the fact that a demand is actually made that gives sense to the notion that one has to perform an action, rather than merely that it would be good, even the best, to do it (Adams 1999, p. 246). But if it is part of the meaning of ‘morally obligatory’ that one is part of a certain social relationship in which demands are actually made, then it is no longer just an interesting further fact that the property that best answers to the concept ‘morally obligatory’ is the property *being commanded by God*. Rather, one who denies that there is a God or that God actually makes demands on human beings must fail to use the term ‘morally obligatory’ masterfully. For think of the other marks of the moral, especially those of impartiality and overridingness. For one to think of an act as obligatory is for one to think of it as being actually imposed on one as a demand; for every obligation, on Adams' view, there is someone who imposes that obligation by commanding. It is clear a priori that the only being that could impose the sort of obligation that could plausibly be classified as moral would be God. How, then, could one be a masterful user of ‘moral obligation’ without grasping that moral obligations are demands imposed by God?

This analysis view would not, unlike Adams' earlier formulation, require the subdivision of linguistic communities. One could say that the meaning of ‘morally obligatory’ includes ‘being commanded by God,’ for both theists *and* nontheists. Those who do not grasp that it is of the essence of obligations to be

divinely commanded -- whether theists or nontheists -- fail to be masterful users of the language of moral obligation. To embrace this view is to return to the position of Anscombe 1958, according to which we should hold that the concept of obligation is inherently theological. On this view, we should not allow that Judeo-Christian moral practice has a different concept of obligation. Rather, the theological understanding of obligation is the authentic one, and nontheological concepts of obligation are unintelligible truncations.

3. Perennial difficulties for metaethical theological voluntarism

Apart from the difficulties that must be handled by particular formulations of theological voluntarism, there are a number of objections that have been levelled against theological voluntarist views as such. A wide variety of these objections are helpfully discussed in Quinn 1999 (pp. 65-71). Here I will consider only two objections, but they are the two that are characteristically taken to be the most powerful perennial objections to theological voluntarism: first, that theological voluntarism is incompatible with any substantive sense in which God is good; second, that theological voluntarism entails the arbitrariness of morality. While these objections have been answered plausibly in recent formulations of theological voluntarism, the way that these objections have been answered leave theological voluntarists open to a different objection: that theological voluntarism is not adequately motivated as a philosophical position. I conclude with a brief discussion of this worry.

3.1 Theological voluntarism and God's goodness

God is, by definition, good. This is both a fixed point concerning God's nature and a plausibility-making feature of theological voluntarism. If one were to deny that God is good (understood *de dicto* -- that is, ‘if there is a being that qualifies as God, then that being is good’), one would call one's own competence in use of the term ‘God’ into question. And even if it were allowed that one can employ the term ‘God’ masterfully while denying that God is good, if one were to deny that God is good, then one would undercut one's capacity to defend theological voluntarism. For theological voluntarism is plausible only if God is an exalted being; but a being that is not good is not an exalted being.

That God is good is a fixed point for theistic discourse in general and for theological voluntarism in particular provides the basis for a common objection to theological voluntarism: that theological voluntarism makes it impossible to say that, in any substantive sense, God is good. The most straightforward formulation of the objection is as follows. For God to be good is for God to be morally good. But if moral goodness is to be understood in theological voluntarist terms, then God's goodness consists only in God's measuring up to a standard that God has set for Himself. While this is perhaps an admirable resoluteness -- it is, other things being equal, a good thing to live up to your own standards -- it is hardly the sort of thing that provokes in us the admiration that God's goodness is supposed to provoke.

Now, one might dispute the claim that if God's goodness consists simply in God's living up to a standard

that God has set for Himself, then that goodness is far less admirable than we would have supposed. (See, for a nice discussion of this issue, Clark 1982, esp. pp. 341-343.) Suppose, though, that we grant this part of the argument. How powerful is the objection from God's goodness against theological voluntarism?

As we noted earlier, theological voluntarism comes in a variety of strengths. One dimension along which a theological voluntarist view might be assessed as stronger or weaker is in terms of the range of normative properties that it attempts to account for in theological voluntarist terms. The strength of the objection from God's goodness is directly proportional to the size of the range of normative properties that one wishes to explain in theological voluntarist terms (see also Alston 1990). If one wishes only to account for a proper subset of moral notions, such as obligation, with one's theological voluntarism, then the objection from God's goodness is very weak; if one wishes to provide a sweeping account of normativity in theological voluntarist terms, then the objection is much stronger.

Suppose, for example, that one defends a version of theological voluntarism that accounts only for obligation. If moral obligation only is dependent on acts of the divine will, one can appeal to moral notions other than deontic ones in order to provide a substantive sense in which God is good. Granting to some extent the force of the objection, we can say, on this view, that God's moral goodness cannot consist in God's adhering to what is morally obligatory. But there are other ways to assess God morally other than in terms of the morally obligatory. Adams, for example, holds that God should be understood as benevolent and as just, and indeed concedes that his theological voluntarist account of obligation as the divinely commanded is implausible unless God is thus understood (Adams 1999, pp. 253-255). The ascription to God of these moral virtues is entirely consistent with his theological voluntarism, for his theological voluntarism is not meant to provide any account of the moral virtues. One can hold that God's moral goodness involves supereminent possession of the virtues, at least insofar as those virtues do not presuppose weakness and vulnerability. God is good because God is supremely just, loyal, faithful, benevolent, and so forth. It seems that ascribing to God supereminent possession of these virtues would be enough to account for God's supreme moral goodness: it is, after all, in such terms that God is praised in the Psalms.

Matters become more difficult for theological voluntarist views that aim to provide accounts of all moral notions in terms of God's will. If one held to such an ambitious version of theological voluntarism -- if one were to hold, say, that a state of affairs is morally good because it is a state of affairs that God wishes to obtain for its own sake, and that a character trait is a moral virtue because it is a property that God wants one to have for its own sake, and that an action is morally obligatory because it is antecedently intended by God, and so forth -- then obviously the gambit employed by the less ambitious theological voluntarist is unavailable. The more ambitious theological voluntarist should hold, instead, that God's goodness is not to be understood in moral terms. God's being good might be understood in terms of God's being *good to us*, where us includes all created rational beings, or all created sentient beings, or whatever class of created beings to which one thinks that God has a special relationship. What it is for God to be good to us would be for God to be loving -- to will each of our goods, and to do so in a way that plays no favorites. This understanding of ‘loving’ does not run afoul of theological voluntarism construed as an account of all moral goods, because ‘our goods’ is to be interpreted in terms of prudential goodness, what

makes each of us well-off (but see Chandler 1985).

Suppose, though, that one were to go all the way, holding that theological voluntarism is the correct account of all normative notions: on this extremely ambitious view, anything that is intrinsically action-guiding depends on God's will. I think that the ‘God is good to us’ understanding of God's goodness is ruled out on this approach: for the notion of ‘good to us’ is a normative notion. Perhaps one could hold, on this view, that ‘God is good’ affirms of God some sort of metaphysical goodness, fullness of being. This surely makes God exalted, but it is not clear whether the will of such a being is plausibly understood as the source of all normative statuses. It is also less than clear that ‘God is good,’ on this reading, is the claim that God possesses a particular perfection, rather than is merely a reminder that God has a variety of perfections.

To sum up, then: for each of the various formulations of theological voluntarism, there seems to be some way of answering the charge that the view undercuts the notion that God is good. But the strain needed to answer the charge becomes greater the wider the range of normative properties that the formulation of theological voluntarism aims to explain.

3.2 Theological voluntarism and arbitrariness

It is also an extraordinarily popular charge against theological voluntarism that it entails, objectionably, that morality is arbitrary. There is, however, more than one objection here, and the different objections need to be distinguished and answered individually. One claim is that theological voluntarism implies that God's commands/intentions, on which moral statuses depend, must be arbitrary. A distinct claim is that theological voluntarism implies that the content of morality is itself arbitrary, that it is of the essence of morality to exhibit a certain rational structure, and that theological voluntarism precludes its having that structure. I will consider each of these objections in turn.

One arbitrariness objection against theological voluntarism is that if theological voluntarism is true, then God's commands/intentions must be arbitrary; and it cannot be that morality could wholly depend on something arbitrary; and so theological voluntarism must be false. In favor of the claim that if theological voluntarism were true, then morality would be arbitrary: morality would be arbitrary, on theological voluntarism, if God lacks reasons for the commands/intentions that God gives/has; but because theological voluntarism holds that reasons depend on God's commands/intentions, it is clear that there could ultimately be no reason for God's commanding/intending one thing rather than another. In favor of the claim that morality could not wholly depend on something arbitrary: when we say that some moral state of affairs obtains, we take it that there is a reason for that moral state of affairs obtaining rather than another. Moral states of affairs do not just happen to obtain.

Just as in the case of the objection from God's goodness, the strength of this version of the objection from arbitrariness depends on the formulation of theological voluntarism that is being attacked. The arbitrariness objection becomes more difficult to answer the stronger the relationship between God's intentions/commands and moral properties is held to be; and it becomes more difficult to answer the

more normative properties one attempts to account for by appeal to God's intentions/commands.

The arbitrariness objection has less force if one holds that, say, only moral obligations are to be accounted for by theological voluntarism. The claim made by the objector is that morality is arbitrary on theological voluntarism, because God has no reason for having one set of commands/intentions rather than another. But this is so only if one appeals to the very strong form of theological voluntarism on which all normative states of affairs depend on God's will. If one holds that only moral obligations are determined by God's will, then God might have moral reasons for selecting one set of commands/intentions rather than another: that, for example, one set of commands/intentions is more benevolent, or just, or loyal, than another. If one holds that all moral properties are determined by God's will, then God might have nonmoral reasons for selecting one set of commands/intentions rather than another: that one set of commands/intentions is more loving than another. The fewer normative properties that a version of theological voluntarism attempts to account for, the less susceptible it is to the claim that theological voluntarism implies the arbitrariness of God's commands/intentions.

Now, one might respond on behalf of this version of the arbitrariness objection that even if it is true that there can be reasons for God to choose the commands/intentions that God chooses, it is unlikely that these reasons would wholly determine God's choice of commands/intentions, and so there would be some latitude for arbitrariness in God's choices/intentions. But of itself this is not much of a worry. The initial claim pressed against theological voluntarism was that it made all of God's commands/intentions ultimately arbitrary, and morality could not depend on something so thoroughly arbitrary. But the chastened claim -- that there is some arbitrariness in God's commands -- is far less troubling on its own. We are already familiar with morality depending to some extent on arbitrary facts about the world: if one thinks about the particular requirements that he or she is under, one will note straightaway the extent to which these requirements have resulted from contingent and indeed fluky facts about oneself, one's relationships, and one's circumstances. It does not seem that allowing that God has some choices to make concerning what to command/intend with respect to the conduct of created rational beings that are undetermined by reasons must introduce an intolerable arbitrariness into the total set of divine commands/intentions.

Allowing for such pockets of divine discretion does not provide backing for this version of the objection from arbitariness, but rather offers a premise for the other version of the objection from arbitrariness. This other version of the objection from arbitrariness holds that moral states of affairs exhibit a certain rational structure that they would not have if theological voluntarism were true. Here is the idea, roughly formulated. Suppose that some moral state of affairs obtains -- that it is the case that murder is wrong, or that lying is objectionable, or that courage is a virtue, or that Sharon's snubbing me in that way was unforgivable. The idea is that for any such moral state of affairs, the following is true: either we can provide a *justification* for the obtaining of that moral state of affairs, or that moral state of affairs is *necessary*. A justification of an obtaining moral state of affairs *A* is some obtaining moral state of affairs *B* (where *A* is not identical with *B*), which in conjunction with the other non-moral facts entails that *A* obtains. So, for example: it may be the justification for *murder's being prima facie wrong* that murder is an intentional harm (non-moral fact) and intentionally harming is prima facie wrong (obtaining moral state of affairs). Now, presumably not all moral states of affairs can be justified: eventually there will be

basic moral states of affairs, for which no justification can be given. But it would be very unsatisfactory to say that these basic moral states of affairs just happen to obtain. So any basic moral states of affairs must obtain necessarily. Perhaps *unrelieved suffering's being bad* is a state of affairs of this sort, or perhaps *rational beings'being worthy of respect*.

The claim that the structure of morality is not arbitrary is, put positively, the claim that every obtaining moral state of affairs either has a justification or is necessary. And, thus, what those who claim that theological voluntarism entails that morality is objectionably arbitrary mean is that if theological voluntarism is true, then there are some moral states of affairs that both lack a justification and are not necessary. The view that God's commands/intentions are not wholly determined by reasons offer our basis for holding that there are some moral states of affairs that both lack a justification and are not necessary. For consider some act of φ-ing that is not subsumed under any other issued divine command and which is such that God lacks decisive reasons to command or not to command its performance. In the possible world in which God issues a command to φ, there is a moral state of affairs -- *its being obligatory to* φ -- which lacks a justification (for the action is subsumed under no other divine command) and is not necessary (for God might have failed to command the action).

Some theological voluntarists have responded to this sort of worry by claiming that what God commands/intends with respect to human action, God does so necessarily. But this seems either to understate the divine freedom or to overstate the determination of God's commands by reasons. More plausible is the denial of the claim that morality must exhibit the particular structure presupposed in the objection. While I think that in general the subsumption model of justification is innocuous enough -- even particularists can affirm it, if they affirm even the most minimal doctrine of moral supervenience -- its appeal to necessary moral states of affairs as the only proper starting point is dubious. It is not clear why the starting points for justification have to be necessary moral states of affairs. Surely if these moral states of affairs are basic, their moral status must not be explained by appeal to other moral states of affairs, but that does not mean they must be necessary; they might be contingent, and have their moral status explained in some way other than an appeal to another moral state of affairs. It could be, for example, that the explanation of them appeals to a contingent nonmoral state of affairs plus some necessary state of affairs concerning a connection between that contingent nonmoral state of affairs and the moral state of affairs. Theological voluntarism would be an instance of this latter model.

3.3 Is theological voluntarism adequately motivated?

Both with respect to the objection from God's goodness and with respect to the objection from arbitrariness, the now-standard theological voluntarist response is not to bite the bullet but rather to restrict the range of normative properties of which theological voluntarism is supposed to provide an account. So Adams, Quinn, and Alston all recommend theological voluntarism only as a theory about properties like *being morally obligatory*, and not about any other normative properties. The worry is that allowing that there is adequate motivation to refuse to understand these other normative properties in theological voluntarist terms might commit one to holding that there is adequate motivation to refuse to understand obligation-type properties in theological voluntarist terms. Look, one might say: if you are

willing to hold that all moral properties other than those in the obligation family are to be understood in non-theological voluntarist terms, what is to stop us from holding that obligation is to be understood in non-theological voluntarist terms as well? If we are willing to give up theological voluntarism in some moral domains, why not in all of them?

The most well-developed account of why we should treat obligation as special is Adams', on which obligation is apt for theological voluntarist treatment because of its intrinsic link to demands made within social relationships (Adams 1987b, and Adams 1999, pp. 231-258). But it is also unclear whether this is persuasive. We may grant that obligations result from demands, but only if we emphasize (as Adams does) that it is demands from *authorities* that result in obligations. But what makes someone an authority is that by his or her dictates he or she can give reasons for action of a certain kind. There is some dispute over what kind of reasons they must be, but for our purposes we can just follow Joseph Raz, who holds that genuine authorities give “protected reasons” by their dictates, where a protected reason to φ is a reason to φ and a reason to disregard some reasons against φ-ing. If one is an authority over another with respect to φ-ing, then one's dictate that the other φ is a protected reason for the other to φ (Raz 1979, p. 18).

But now here is the question. We agree that obligations arise from authoritative dictates. And we agree that for a dictate to be authoritative is for it to constitute a certain sort of reason, let us say a protected one. But why, then, would we identify obligations with protected reasons that result from demands, rather than (as Raz does) with protected reasons themselves, whatever their source? If, after all, there were other ways of producing protected reasons other than through the giving of commands, what would be the point of saying ‘oh, but though there is a protected reason to φ, it isn't really *obligatory* to φ.’ Surely if there were any point to this remark it would be purely verbal, and of no philosophical / normative interest.

It turns out, then, that whether Adams' move is enough to motivate theological voluntarism about obligation is dependent on whether there are in fact any protected reasons (or reasons of whatever structure that one thinks that authoritative dictates must give) that are not dependent on demands being made. If there are such reasons -- which natural law theorists, for example, would hold -- then Adams' gambit will not work, and the theological voluntarist will have to look elsewhere for motivation to understand obligation in those terms.

Distributive Justice

Principles of distributive justice are normative principles designed to allocate goods in limited supply relative to demand. The principles vary in numerous dimensions. They vary in what goods are subject to distribution (income, wealth, opportunities, etc.); on the nature of the subjects of the distribution (natural persons, groups of persons, reference classes, etc.); and on what basis the goods should be distributed (equality, according to individual characteristics, according to free market transactions, etc.).

This entry will focus on principles of distributive justice designed to cover the distribution of material goods and services to individuals. Principles of this kind have been the dominant source of Anglo-American debate on distributive justice over the last three decades.

---

1. Strict Egalitarianism

One of the simplest principles of distributive justice is that of strict or radical equality. The principle says that every person should have the same level of material goods and services. The principle is most commonly justified on the grounds that people are owed equal respect and that equality in material goods and services is the best way to give effect to this ideal.

Even with this ostensibly simple principle some of the difficult specification problems of distributive principles can be seen. The two main problems are the construction of appropriate indices for

measurement (the index problem), and the specification of time frames. Because there are numerous proposed solutions to these problems, the ‘principle of strict equality’ is not a single principle but a name for a group of closely related principles. This range of possible specifications occurs with all the common principles of distributive justice.

The index problem arises primarily because the goods to be distributed need to be measured if they are going to be distributed according to some pattern (such as equality). The strict equality principle stated above says that there should be ‘the same *level* of material goods and services’. The problem is how to specify and measure levels. One way of solving the index problem in the strict equality case is to specify that everyone should have the same *bundle* of material goods and services rather than the same *level* (so everyone would have 4 oranges, 6 apples, 1 bike, etc.). The main problem with this solution is that there will be many other allocations of material goods and services which will make some people better off without making anybody else worse off. For instance, a person preferring apples to oranges will be better off if she swaps some of the oranges from her bundle for some of the apples belonging to a person preferring oranges to apples. Indeed, it is likely that everybody will have something they would wish to trade in order to make themselves better off. As a consequence, requiring identical bundles will make virtually everybody materially worse off than they would be under an alternative allocation. So specifying that everybody must have the same *bundle* of goods does not seem to be a satisfactory way of solving the index problem. Some index for measuring the value of goods and services is required.

Money is an index for the value of material goods and services. It is an imperfect index and its pitfalls are well-documented in most economics textbooks. Moreover, once the goods to be allocated are extended beyond material ones to include opportunities, etc. it needs to be combined with other indices. (For instance, John Rawls' index of primary goods - see Rawls 1971.) Nevertheless, using money as index for the value of material goods and services is the most practical response so far suggested to the index problem and is widely used in the specification and implementation of distributive principles.

The second main specification problem involves time frames. Many distributive principles identify and require that a particular pattern of distribution be achieved. But they also need to specify *when* the pattern is required. One version of the principle of strict equality requires that all people should have the same wealth at some initial point, after which people are free to use their wealth in whatever way they choose. Principles specifying initial distributions after which the pattern need not be preserved are commonly called ‘starting-gate’ principles. (See Ackerman 1980, 53-59,168-170,180-186)

Because ‘starting-gate’ forms of the strict equality principle may lead in time to very inegalitarian wealth distributions they are not common. The most common form of strict equality principle specifies that *income* (measured in terms of money) should be equal in *each* time-frame, though even this may lead to significant disparities in wealth if variations in savings are permitted. Hence, strict equality principles are commonly conjoined with some society-wide specification of just saving behavior.

There are a number of direct moral criticisms made of strict equality principles: that they unduly restrict freedom, that they do not give best effect to equal respect for persons, that they conflict with what people

deserve, etc. (see Desert-Based Principles) But the most common criticism is a welfare-based one: that everyone can be materially better off if incomes are not strictly equal. (see Carens) It is this fact which partly inspired the Difference Principle.

2. The Difference Principle

The wealth of an economy is not a fixed amount from one period to the next. More wealth can be produced and indeed this has been the experience of industrialized countries over the last few centuries. The most common way of producing more wealth is to have a system where those who are more productive earn greater incomes. This partly inspired the formulation of the Difference Principle.

The most widely discussed theory of distributive justice in the past three decades has been that proposed by John Rawls in *A Theory of Justice,* (Rawls 1971), and *Political Liberalism,* (Rawls 1993). Rawls proposes the following two principles of justice:

> 1. Each person has an equal claim to a fully adequate scheme of equal basic rights and liberties, which scheme is compatible with the same scheme for all; and in this scheme the equal political liberties, and only those liberties, are to be guaranteed their fair value.
>
> 2. Social and economic inequalities are to satisfy two conditions: (a) They are to be attached to positions and offices open to all under conditions of fair equality of opportunity; and (b), they are to be to the greatest benefit of the least advantaged members of society. (Rawls 1993, pp. 5-6. The principles are numbered as they were in Rawls' original *A Theory of Justice.*)

Under Rawls' proposed system Principle (1) has priority over Principle (2). In addition to (2b) it is possible to think of Principles (1) and (2a) as principles of distributive justice: (1) to govern the distribution of liberties, and (2a) the distribution of opportunities. Looking at the principles of justice in this way makes all principles of justice, principles of distributive justice (even principles of retributive justice will be included on the basis that they distribute negative goods). Keeping in line with the primary focus of this entry though, let us concentrate on (2b), known as the Difference Principle.

The main moral motivation for the Difference Principle is similar to that for strict equality: equal respect for persons. Indeed the Difference Principle materially collapses to a form of strict equality under empirical conditions where differences in income have no effect on the work incentive of people. The overwhelming opinion though is that in the foreseeable future the possibility of earning greater income will bring forth greater productive effort. This will increase the total wealth of the economy and, under the Difference Principle, the wealth of the least advantaged. Opinion divides on the size of the inequalities which would, as a matter of empirical fact, be allowed by the Difference Principle, and on how much better off the least advantaged would be under the Difference Principle than under a strict equality principle. Rawls' principle however gives fairly clear guidance on what type of arguments will

count as justifications for inequality. Rawls is not opposed to the principle of strict equality *per se*, his concern is about the *absolute* position of the least advantaged group rather than their *relative* position. If a system of strict equality maximizes the absolute position of the least advantaged in society, then the Difference Principle advocates strict equality. If it is possible to raise the absolute position of the least advantaged further by having some inequalities of income and wealth, then the Difference Principle prescribes inequality up to that point where the absolute position of the least advantaged can no longer be raised.

Because there has been such extensive discussion of the Difference Principle in the last 30 years, there have been numerous criticisms of it from the perspective of all the other theories of distributive justice outlined here. Briefly, the main criticisms are as follows.

Advocates of strict equality argue that inequalities permitted by the Difference Principle are unacceptable even if they do benefit the least advantaged. The problem for these advocates is to explain in a satisfactory way why the relative position of the least advantaged is more important than their absolute position, and hence why society should be prevented from materially benefiting the least advantaged when this is possible. The most common explanation appeals to solidarity (Crocker): that being materially equal is an important expression of the equality of persons. Another common explanation appeals to the power some may have over others, if they are better off materially. Rawls' response to this latter criticism appeals to the priority of his first principle: The inequalities consistent with the Difference Principle are only permitted so long as they do not compromise the fair value of the political liberties. So, for instance, very large wealth differentials may make it practically impossible for poor people to be elected to political office or to have their political views represented. These inequalities of wealth, even if they increase the material position of the least advantaged group, may need to be reduced in order for the first principle to be implemented.

The Utilitarian objection to the Difference Principle is that it does not maximize utility. In *A Theory of Justice*, Rawls uses Utilitarianism as the main theory for comparison with his own, and hence he responds at length to this Utilitarian objection and argues for his own theory in preference to Utilitarianism (some of these arguments are outlined in the section on Welfare-Based Principles).

Libertarians object that the Difference Principle involves unacceptable infringements on liberty. For instance, the Difference Principle may require redistributive taxation to the poor, and Libertarians commonly object that such taxation involves the immoral taking of just holdings. (see Libertarian Principles)

The Difference Principle is also criticized as a primary distributive principle on the grounds that it mostly ignores claims that people *deserve* certain economic benefits in light of their actions. Advocates of Desert-Based Principles argue that some may deserve a higher level of material goods because of their hard work or contributions even if their unequal rewards do not also function to improve the position of the least advantaged. They also argue that the explanations of *how* people come to be in more or less advantaged positions is relevant to their fairness, yet the Difference Principle wrongly ignores these

explanations.

Like Desert theorists, advocates of Resource-Based Principles criticize the Difference Principle on the grounds that it is not ‘ambition-sensitive’ enough, i.e. it is not sensitive to the consequences of people's choices. They also argue that it is not adequately ‘endowment-sensitive’: it does not compensate people for natural inequalities (like handicaps or ill-health) over which people have no control.

3. Resource-Based Principles

Resource-based principles (also called Resource Egalitarianism) prescribe equality of resources. Interestingly, resource-based principles do not normally prescribe a patterned outcome - the idea being that the outcomes are determined by people's free use of their resources. Resource-theorists claim that the Difference Principle is insufficiently ‘ambition-sensitive’ and that provided people have equal resources they should live with the consequences of their choices. They argue, for instance, that people who choose to work hard to earn more income should not be required to subsidize those choosing more leisure and hence less income.

Resource-theorists also make a related complaint that the Difference Principle is not sufficiently ‘endowment-sensitive.’ While part of Rawls' motivation for the Difference principle is that people have unequal endowments, resource-theorists explicitly emphasize this feature of their theory though they differ on which endowments are relevant to questions of distributive justice. They agree that, ideally, social circumstances over which people have no control should not adversely affect life prospects or earning capacities. Some resource-theorists further argue that, for the same sorts of reasons, unequal natural endowments should attract compensation. For instance, people born with handicaps, ill-health, or low levels of natural talents have not brought these circumstances upon themselves and hence, should not be disadvantaged in their life prospects.

The most prominent Resource-based theory, developed by Ronald Dworkin, (Dworkin 1981a, 1981b), proposes that people begin with equal resources but end up with unequal economic benefits as a result of their own choices. What constitutes a just material distribution is to be determined by the result of a thought experiment designed to model fair distribution. Suppose that everyone is given the same purchasing power and each use that purchasing power to bid, in a fair auction, for resources best suited to their life plans. They are then permitted to use those resources as they see fit. Although people may end up with different economic benefits, none of them is given less consideration than another in the sense that if they wanted somebody else's resource bundle they could have bid for it instead.

As mentioned above, many resource-theorists, including Dworkin, add to this system of equal resources and ambition-sensitivity, a sensitivity to inequalities in natural endowments. They note that natural inequalities are not distributed according to people's choices, nor are they justified by reference to some other morally relevant fact about people. Dworkin proposes a hypothetical compensation scheme in which he supposes that, before the hypothetical auction described above, people do not know their own natural endowments. However, they are able to buy insurance against being disadvantaged in the natural

distribution of talents and they know that their payments will provide an insurance pool to compensate those people who are unlucky in the ‘natural lottery’.

Because the Resource-based theory has a similar motivation to the Difference Principle the moral criticisms of it tend to be variations on those leveled against the Difference Principle. However, unlike the Difference Principle, it is not at all clear what would constitute an implementation of Resource-based theories and their variants in a real economy. It seems impossible to measure differences in people's natural talents - unfortunately, people's talents do not neatly divide into the natural and developed categories. A system of special assistance to the physically and mentally handicapped and to the ill would be a partial implementation of the compensation system, but most natural inequalities would be left untouched by such assistance while the theory requires that such inequalities be compensated for. It is simply not clear how to implement equality of resources in a complex economy and hence despite its theoretical advantages, it is difficult to see it as a practical improvement on the Difference Principle.

4. Welfare-Based Principles

Welfare-based principles are motivated by the idea that what is of primary moral importance is the level of welfare of people. Advocates of Welfare-based principles view the concerns of other theories - equality, the least advantaged, resources, desert-claims, or liberty as derivative concerns. Resources, equality, desert-claims, or liberty are only valuable in so far as they increase welfare, so that all distributive questions should be settled according to which distribution maximizes welfare. However, ‘maximizes welfare’ is imprecise, so welfare theorists propose particular welfare functions to maximize. The welfare functions proposed vary enormously both on what will count as welfare and the weighting system for that welfare. For almost any distribution of material benefits there is a welfare function whose maximization will yield that distribution (at least in a one sector period).

Distribution according to some welfare function is most commonly advocated by economists, who normally state the explicit functional form. Philosophers tend to avoid this. Philosophers also tend to restrict themselves to a small subset of the available welfare functions. Although there are a number of advocates of alternative welfare functions (like ‘equality of well-being’), most philosophical activity has concentrated on a variant known as Utilitarianism. This theory can be used to illustrate most of the main characteristics of Welfare-based principles.

Historically, Utilitarians have used the term ‘utility’ rather than ‘welfare’ and utility has been defined variously as pleasure, happiness, or preference-satisfaction. So, for instance, the principle for distributing economic benefits for Preference Utilitarians is to distribute them so as to maximize preference-satisfaction. The welfare function for such a principle has a simple theoretical form: it involves choosing that distribution maximizing the arithmetic sum of all satisfied preferences (unsatisfied preferences being negative), weighted for the intensity of those preferences.

The basic theory of Utilitarianism is one of the simplest to state and understand. Much of the work on the theory therefore has been directed towards defending it against moral criticisms, particularly from the

point of view of ‘commonsense’ morality. The criticisms and responses have been widely discussed in the literature on Utilitarianism as a general moral theory. Only two of the criticisms will be mentioned here.

The first is that Utilitarianism fails to take the distinctness of persons seriously. Maximization of preference-satisfaction is often taken as prudent in the case of individuals - people may take on greater burdens, suffering or sacrifice at certain periods of their lives so that their lives are overall better. The complaint against Utilitarianism is that it takes this principle, commonly described as prudent for individuals, and uses it on an entity, society, unlike individuals in important ways. While it may be acceptable for a person to choose to suffer at some period in her life (be it a day, or a number of years) so that her overall life is better, it is often argued against Utilitarianism that it is immoral to make some people suffer so that there is a net gain for other people. In the individual case, there is a single entity experiencing both the sacrifice and the gain. Also, the individuals, who suffer or make the sacrifices, choose to do so in order to gain some benefit they deem worth their sacrifice. In the case of society as a whole, there is no single experiential entity - some people suffer or are sacrificed so that others may gain. Furthermore, under Utilitarianism, there is no requirement for people to consent to the suffering or sacrifice.

A related criticism of Utilitarianism involves the way it treats individual preferences or interests referring to the holdings of others. For instance, some people may have a preference that some minority racial group should have less material benefits. Under Utilitarian theories, in their classical form, this preference or interest counts like any other in determining the best distribution. Hence, if racial preferences are widespread and are not outweighed by the minorities' contrary preferences, Utilitarianism will recommend an inegalitarian distribution based on race.

Utilitarians have responded to these criticisms in a number of ways. Utilitarians may apply their theory to the preferences themselves, arguing that utility is best promoted in the long run when people's preferences are shaped (if this is possible) in ways that are harmonious with one another, suggesting racist preferences should be discouraged. However, the utilitarian then must supply an account of why racist or sexist preferences should be discouraged when the same level of total long term utility could be achieved by encouraging the less powerful to be contented with a lower position. It is difficult for utilitarians to explain why the position of the oppressed is aptly desribed as one of oppression. Utilitarians have also argued that the empirical conditions are such that utility maximizing will rarely require women or racial minorities to sacrifice or suffer for the benefit of others, or to satisfy the prejudices of others. But if their theory on rare occasions does require people sacrifice or suffer in these ways, Utilitarians have defended this unintuitive consequence on the grounds that our judgements about what is wrong provide us with ‘rules of thumb’ which are useful at the level of commonsense morality but ultimately mistaken at the level of ‘critical theory’.

Utilitarian distribution principles, like the other principles described here, have problems with specification and implementation. Most formulations of Utilitarianism require interpersonal comparisons of utility. This means, for instance, that we must be able to compare the utility one person gains from eating an apple with that another gains from eating an apple. Furthermore, Utilitarianism requires that

differences in utility be measured and summed for widely disparate goods (so, for instance, the amount of utility a particular person gains from playing football is measured and compared with the amount of utility another gains from eating a gourmet meal). Critics have argued that such interpersonal utility comparisons are impossible, even in theory, due to one or both of the following: (1) It is not possible to combine all the diverse goods into a single index of ‘utility’ which can measured for an individual; (2) Even if you could do the necessary weighing and combining of the goods to construct such an index for an individual, there is no conceptually adequate way of calibrating such a measure between individuals. (see Elster 1991)

Utilitarians face a greater problem than this theoretical one in determining what material distribution is prescribed by their theory. Those who share similar Utilitarian theoretical principles frequently recommend very different material distributions to implement the principle. This problem occurs for other theories, but appears worse for Utilitarian and Welfare-based distribution principles. Recommendations for distributions or economic structures to implement other distributive principles commonly vary among advocates with similar theoretical principles, but the advocates tend to cluster around particular recommendations. This is not the case for Utilitarianism, with adherents dispersed in their recommendations across the full range of possible distributions and economic structures. For instance, many Preference Utilitarians believe their principle prescribes strongly egalitarian structures with lots of state invention while many other Preference Utilitarians believe it prescribes a *laissez faire* style of capitalism.

There is an explanation for why Utilitarians are faced with greater difficulties in implementation. Other distributive principles can rule out, relatively quickly, some practical policies on the grounds that they clearly violate the guiding principle, but Utilitarians must examine, in great detail, all the policies on offer. For each policy, they must determine the distribution of goods and services yielded by the policy and at least three other factors: the identity of each person in the distribution (if individuals' utility functions differ); the utility of each person from the goods and services distributed to them; the utility of each person from the policy itself. The size of the information requirements make this task impossible. Hence, broad assumptions must be made and each different set of assumptions will yield a different answer, and so the answers range across the full set of policies on offer. Moreover, there is no obvious way to arbitrate between the different sets of assumptions. For instance, suppose three Utilitarians agree on the same Utilitarian distributive principle. Utilitarian 1 however, asserts that the population's utility function conforms to function A (e.g. people's marginal utility is linear in the goods and services they consume) and is maximized by Policy 1; while Utilitarian 2 asserts that half the population's utility function conforms to function A and half to function B (e.g. people's marginal utility is diminishing) and is maximized by Policy 2; Utilitarian 3 asserts Utilitarian 2 is correct about the utility functions of the population but claims that Policy 3 will maximize utility. What seems impossible for advocates of Utilitarian-distribution principles to answer is how we would arbitrate these claims. If Utilitarian principles are to play a role in debates about distributive justice then this is the most important question to answer.

5. Desert-Based Principles

Another complaint against welfarism is that it ignores, and in fact cannot even make sense of, claims that people *deserve* certain economic benefits in light of their actions. The complaint is often motivated by the concern that various forms of welfarism treat people as mere containers for well-being, rather than purposeful beings, responsible for their actions and creative in their environments.

The different desert-based principles of distribution differ primarily according to what they identify as the basis for deserving. Most contemporary proposals for desert-bases fit into one of three broad categories:

1. Contribution: People should be rewarded for their work activity according to the value of their contribution to the social product. (Miller 1976, Miller 1989, Riley)
2. Effort: People should be rewarded according to the effort they expend in their work activity.
3. Compensation: People should be rewarded according to the costs they incur in their work activity. (Sadurski, Lamont 1997)

Aristotle argued that virtue should be a basis for distributing rewards, but most contemporary principles owe a larger debt to John Locke. Locke argued people deserve to have those items produced by their toil and industry, the products (or the value thereof) being a fitting reward for their effort. His underlying idea was to guarantee to individuals the fruits of their own labor and abstinence. According to the contemporary desert theorist, people freely apply their abilities and talents, in varying degrees, to socially productive work. People come to deserve varying levels of income by providing goods and services desired by others. (Feinberg) Distributive systems are just insofar as they distribute incomes according to the different levels earned or deserved by the individuals in the society for their productive labors, efforts, or contributions.

Contemporary desert-principles all share the value of raising the standard of living - collectively, ‘the social product’. Under each principle, only activity directed at raising the social product will serve as a basis for deserving income. The concept of desert itself does not yield this value of raising the social product; it is a value societies hold independently. Hence, desert principles identifying desert-bases tied to socially productive activity (productivity, compensation, and effort all being examples of such bases) do not do so because the concept of desert requires this. They do so because societies value higher standards of living, and therefore choose the raising of living standards as the primary value relevant to desert-based distribution. This means that the full development of desert-based principles requires specification (and defense) of those activities which will or will not count as socially productive, and hence as deserving of remuneration. (Lamont 1994)

It is important to distinguish desert-payments from entitlements. For desert theorists a well-designed institutional structure will make it so that many of the entitlements people have are deserved. But, of course, entitlements and just deserts can come apart – a person can be entitled to a payment without it being deserved, just as a person can be entitled to assume the presidential office without deserving it. (Feinberg 1970, 86) Similarly, a person may deserve a payment but not being entitled to it (such

instances are potential areas for institutional reform for a desert theorist). Payments designed to give people incentives are a form of entitlement particularly worth distinguishing from desert-payments as they are commonly confused. Incentive-payments are ‘forward-looking’ (Barry 1965, 111-112) in that they are set up to create a situation in the future, while desert-payments are ‘backwards-looking’ that they are justified with reference to work in the present or past. Even though it is possible for the same payment to be both deserved and an incentive, incentives and desert provide distinct rationales for income and should not be conflated. (Lamont 1997)

While some have sought to justify current capitalist distributions via desert-based distributive principles, John Stuart Mill and many since have forcefully argued the contrary claim - that the implementation of a productivity principle would involve dramatic changes in modern market economies and would greatly reduce the inequalities characteristic of them. It is important to note, though, that contemporary Desert-based principles are rarely complete distributive principles. They usually are only designed to cover distribution among working adults, leaving basic welfare needs to be met by other principles.

The specification and implementation problems for desert-based distribution principles revolve mainly around the desert-bases: it is difficult to identify what is to count as a contribution, an effort or a cost, and it is even more difficult to measure these in a complex modern economy.

The main moral objection to desert-based principles is that they make economic benefits depend on factors over which people have little control. John Rawls has made one of the most widely discussed arguments to this effect (Rawls 1971), and while the strong form of this argument has been clearly refuted (Zaitchik, Sher), it remains a problem for desert-based principles. The problem is most pronounced in the case of productivity-based principles - a person's productivity seems clearly to be influenced by many factors over which the person has little control.

It is interesting to note that under most welfare-based principles, it is also the case that people's level of economic benefits depend on factors beyond their control. But welfarists view this as a virtue of their theory, since they think the only morally relevant characteristic of any distribution is the welfare resulting from it. Whether the distribution ties economic benefits to matters beyond our control is morally irrelevant from the welfarist point of view. (As it happens, welfarists often hold the empirical claim that people have little control over their contributions to society anyway.) However, for people's benefits to depend on factors beyond their control is a more awkward result for desert theorists who emphasize the responsibility of people in choosing to engage in more or less productive activities.

6. Libertarian Principles

Most contemporary versions of the principles discussed so far allow some role for the market as a means of achieving the desired distributive pattern - the Difference Principle uses it as a means of helping the least advantaged; utilitarian principles commonly use it as a means of achieving the distributive pattern maximizing utility; desert-based principles rely on it to distribute goods according to desert, etc. In contrast, advocates of Libertarian distributive principles rarely see the market as a means to some desired

pattern, since the principle(s) they advocate do not ostensibly propose a ‘pattern’ at all, but instead describe the sorts of acquisitions or exchanges which are themselves just. The market will be just, not as a means to some pattern, but insofar as the exchanges permitted in the market satisfy the conditions of just exchange described by the principles. For Libertarians, just outcomes are those arrived at by the separate just actions of individuals; a particular distributive pattern is not required for justice. Robert Nozick has advanced this version of Libertarianism (Nozick 1974), and is its most well-known contemporary advocate.

Nozick proposes a 3-part "Entitlement Theory".

> If the world were wholly just, the following inductive definition would exhaustively cover the subject of justice in holdings:
>
> a. A person who acquires a holding in accordance with the principle of justice in acquisition is entitled to that holding.
> b. A person who acquires a holding in accordance with the principle of justice in transfer, from someone else entitled to the holding, is entitled to the holding.
> c. No one is entitled to a holding except by (repeated) applications of (a) and (b).
>
> The complete principle of distributive justice would say simply that a distribution is just if everyone is entitled to the holdings they possess under the distribution. (Nozick, p.151)

The statement of the Entitlement Theory includes reference to the principles of justice in acquisition and transfer. (For details of these principles see Nozick, pp.149-182.) The principle of justice in transfer is the least controversial and is designed to specify fair contracts while ruling out stealing, fraud, etc. The principle of justice in acquisition is more complicated and more controversial. The principle is meant to govern the gaining of exclusive property rights over the material world. For the justification of these rights, Nozick takes his inspiration from John Locke's idea that everyone ‘owns’ themselves and, by mixing one's labors with the world, self-ownership can generate ownership of some part of the material world. However, of Locke's mixing metaphor, Nozick legitimately asks: ‘...why isn't mixing what I own with what I don't own a way of losing what I own rather than a way of gaining what I don't? If I own a can of tomato juice and spill it in the sea so its molecules... mingle evenly throughout the sea, do I thereby come to own the sea, or have I foolishly dissipated my tomato juice?’ (Nozick 1974, p.174) Nozick concludes that what is significant about mixing our labor with the material world is that in doing so, we tend to increase the value of it, so that self-ownership can lead to ownership of the external world in such cases (Nozick 1974, pp. 149-182).

The obvious objection to this claim is that it is not clear why the first people to acquire some part of the material world should be able to exclude others from it (and, for instance, be the land owners while the later ones become the wage laborers). In response to this objection, Nozick puts a qualification on just acquisition, called the *Lockean Proviso,* whereby an exclusive acquisition of the external world is just, if, after the acquisition, there is ‘enough and as good left in common for others’. One of the main challenges

for Libertarians has been to formulate a morally plausible interpretation of this proviso. According to Nozick's interpretation, an acquisition is just if and only if the position of others after the acquisition is no worse than their position was when the acquisition was unowned or ‘held in common’. For Nozick's critics, his proviso is unacceptably weak. This is because it fails to consider the position others may have achieved under alternative distributions and thereby instantiates the morally dubious criterion of whoever is first gets the exclusive spoils. For example, one can satisfy Nozick's proviso by ‘acquiring’ a beach and charging $1 admission to those who previously were able to use the beach for free, so long as one compensates them with a benefit they deem equally valuable, such as a clean up or life-guarding service on the beach. However, the beach-goers would have been even better off had the more efficient organizer among them acquired the beach, charging only 50 cents for the same service, but this alternative is never considered under Nozick's proviso. (Cohen, 1995)

Will Kymlicka has given a summary of the steps in Nozick's self-ownership argument:

1. People own themselves.
2. The world is initially unowned.
3. You can acquire absolute rights over a disproportionate share of the world, if you do not worsen the condition of others.
4. It is relatively easy to acquire absolute rights over a disproportionate share of the world. Therefore:
5. Once private property has been appropriated, a free market in capital and labor is morally required. (Kymlicka, p.112)

The assessment of this argument is quite complex, but the difficulties mentioned above with the proviso call into question the step from (3) to (4).

The challenge for Libertarians then is to find a plausible reading of (3) which will yield (4). Moreover, at one point, Nozick claims the proviso must apply to both acquisitions and transfers, compounding the problem.

Of course, many existing holdings are the result of acquisitions or transfers which at some point did not satisfy principles (a) and (b) above. Hence, Nozick must supplement those principles with a principle of rectification for past injustice. Although he does not specify this principle he does describe its purpose:

> This principle uses historical information about previous situations and injustices done in them... and information about the actual course of events that flowed from these injustices, until the present, and it yields a description (or descriptions) of holdings in the society. The principle of rectification presumably will make use of its best estimate of subjunctive information about what would have occurred... if the injustice had not taken place. If the actual description of holdings turns out not to be one of the descriptions yielded by the principle, then one of the descriptions yielded must be realized. (Nozick 1974, pp. 152-153)

Nozick does not make an attempt to provide a principle of rectification. The absence of such a principle is much worse for a historical theory than for a patterned theory. Past injustices systematically undermine the justice of every subsequent distribution in historical theories. Nozick is clear that his historical theory is of no use in evaluating the justice of actual societies until such a theory of rectification is given:

> In the absence of [a full treatment of the principle of rectification] applied to a particular society, one *cannot* use the analysis and theory presented here to condemn any particular scheme of transfer payments, unless it is clear that no considerations of rectification of injustice could apply to justify it. (Nozick 1974, p.231)

Unfortunately for the theory, no such treatment will ever be forthcoming because the task is, for all practical purposes, impossible. The numbers of injustices perpetrated throughout history, both within nations and between them, are enormous and the necessary details of the vast majority of injustices are unavailable. Even if the details of the injustices were available, the counterfactual causal chains could not be reliably determined and, as Derek Parfit has pointed out, in a different context, even the people who would have been born would have been different. (Parfit 1986) As a consequence, Nozick's entitlement theory will never provide any guidance as to what the current distribution of material holdings should be nor what distributions or redistributions are legitimate or illegitimate. (Indeed Nozick suggests, for instance, the Difference Principle may be the best implementation of the principle of rectification.) Although Nozick is fairly candid about this consequence, many of his supporters and critics have ignored it and have carried on a vigorous debate as though his theory is an attempt to tell us something about the justice of current economic distributions.

Libertarians inspired by Nozick usually advocate a system in which there are exclusive property rights, with the role of the government restricted to the protection of these property rights. The property rights commonly rule out taxation for purposes other than raising the funds necessary to protect property rights. The strongest critique of any attempt to institute such a system of legally protected property rights comes, as we have seen, from Nozick's theory itself - there seems no obvious reason to give strong legal protection to property rights which have arisen through violations of the just principles of acquisition and transfer. But putting this critique to one side for a moment, what other arguments are made in favor of exclusionary property rights?

As already noted, Nozick argues that because people own themselves and hence their talents, they own whatever they can produce with these talents. Moreover, it is possible in a free market to sell the products of exercising one's talents. Any taxation of the income from such selling, according to Nozick, 'institute[s] (partial) ownership by others of people and their actions and labor'. (Nozick, p.172) People, according to this argument, have these exclusive rights of ownership. Taxation then, simply involves violating these rights and allowing some people to own (partially) other people. Moreover, it is argued, any system not legally recognizing these rights violates Kant's maxim to treat people always as ends in themselves and never merely as a means. The two main difficulties with this argument have been: (1) to show that self-ownership is only compatible with having such strong exclusive property rights; and (2) that a system of exclusive property rights is the best system for treating people with respect, as ends in

themselves.

Nozick candidly accepts that he does not himself give a systematic moral justification of the exclusionary property rights he advocates: ‘This book does not present a precise theory of the moral basis of individual rights.’ (Nozick, p.xiv) But others have tried to provide more systematic justifications of similar rights (Lomasky, Steiner) or to develop, more fully, justifications to which Nozick alludes.

In addition to the arguments from self-ownership, and the requirement to treat people as ends in themselves, the most common other route for trying to justify exclusive property rights has been to argue that they are required for the maximization of freedom and/or liberty or the minimization of violations of these. (Hayek) As an empirical claim though, this appears to be false. If we compare countries with less exclusionary property rights (e.g. more taxation) with countries with more exclusionary property regimes, we see no systematic advantage in freedoms/liberties enjoyed by people in the latter countries. (Of course, we do see a *difference* in distribution of such freedoms/liberties in the latter countries, the richer have more and the poorer less, while in the former they are more evenly distributed.) Now if Libertarians restrict what counts as a valuable freedom/liberty (and discount other freedoms/liberties people value), it will follow that exclusionary property rights are required to maximize freedom/liberty or to minimize violations of these. But the challenge for these Libertarians is to show why only their favored liberties and freedoms are valuable, and not those which are weakened by a system of exclusive property rights.

7. Feminist Principles

There is no one feminist conception of distributive justice; theorists who name themselves feminists defend positions across the political spectrum. Hence, feminists offer distinctive versions of all the theories considered so far as well as others. One way of thinking about what unifies many feminist theorists is an interest in what difference, if any, the practical experience of gender makes to the subject matter or study of justice; how different feminists answer this question distinguishes them from each other and from those alternative distributive principles which most inspire their thinking.

The distributive principles so far outlined, with the exception of strict egalitarianism, could be classified as liberal theories - they both inform, and are the product of, the liberal democracies which have emerged over the last two centuries. Lumping them together this way, though clumsy, makes the task of understanding the emergence of feminist critiques (and the subsequent positive theories) much easier.

John Stuart Mill in *The Subjection of Women* (1869) gives one of the clearest early feminist critiques of the political and distributive structures of the emerging liberal democracies. His writings provide the starting point for many contemporary liberal feminists. Mill argued that the principles associated with the developing liberalism of his time required equal political status for women. The principles Mill explicitly mentions include a rejection of the aristocracy of birth, equal opportunity in education and in the marketplace, equal rights to hold property, a rejection of the man as the legal head of the household, and equal rights to political participation. Feminists who follow Mill believe that a proper recognition of the

position of women in society requires that women be given equal and the same rights as men have, and that these primarily protect their liberty and their status as equal persons under the law. Thus, government regulation should not prevent women from competing on equal terms with men in educational, professional, marketplace and political institutions. From the point of view of other feminisms, the liberal feminist position is a conservative one, in the sense that it requires the proper inclusion for women of the rights, protections, and opportunities previously secured for men, rather than a fundamental change to the traditional liberal position. The problem for women, on this view, is not liberalism but the failure of society and the State to properly instantiate liberal principles.

One phrase or motto around which a whole range of feminists have rallied, however, marks a significant break with Mill's liberalism: ‘the personal is political.’ Feminists have offered a variety of interpretations of this motto, many of which take the form of a critique of liberal theories. Mill was crucial in developing the liberal doctrine of limiting the state's intervention in the private lives of citizens. Many contemporary feminists have argued that the resulting liberal theories of justice have fundamentally been unable to accommodate the injustices that have their origins in this ‘protected’ private sphere. This particular feminist critique has also been a primary source of inspiration for the broader multicultural critique of liberalism. The liberal commitments to government neutrality and to a protected personal sphere of liberty, where the government must not interfere, have been primary critical targets.

While issues about neutrality and personal liberty go beyond debates about distributive justice they also have application within these debates. The feminist critics recognize that liberalism correctly identifies the government as one potential source of oppression against individuals, and therefore recommends powerful political protections of individual liberty. They argue, however, that liberal theories of distributive justice are unable to address the oppression which surfaces in the so-called private sphere of government non-interference. Susan Moller Okin, for example, documents the effects of the institution of the nuclear family, arguing that the consequence of this institution is a position of systematic material and political inequality for women. Standard liberal theories, committed to neutrality in the private sphere, seem powerless to address (or sometimes even recognize) striking and lasting inequalities for women, minorities, or historically oppressed racial groups, when these are merely the cumulative effect of individuals' free behavior. Okin and others demonstrate, for example, that women have substantial disadvantages in competing in the market because of childrearing responsibilities which are not equally shared with men. As a consequence, any theory relying on market mechanisms, including most liberal theories, will yield systems which result in women systematically having less income and wealth than men. Thus, feminists have challenged contemporary political theorists to rethink the boundaries of political authority in the name of securing a just outcome for women and other historically oppressed groups.

While the political effects of personal freedom pose a serious challenge to contemporary liberal theories of distributive justice, the feminist critiques are somewhat puzzling because, as Jean Hampton puts it, many feminists appear to complain in the name of liberal values. In other words, their claims about the fundamental flaws of liberalism at the same time leave in tact the various ideals of liberty and equality which inspire the liberal theories of justice. Moreover, the task of defining feasible pathways for modifying the structure of liberal democracies without undermining their virtues and protections has

proved more difficult than the setting out the criticisms of liberalism. Indeed, despite a legitimate feminist worry about the effects of so-called government neutrality on women's material status, the relative neutrality of liberal democracies compared to non-liberal societies has been one of the significant contributing factors both to the flourishing of feminist theory and to the many significant practical gains women in liberal democracies have made relative to women in other parts of the world. The challenge, being taken up by many, is to navigate both a coherent theoretical and practical path in response to the best feminist critiques available (see the entry on feminist ethics).

Desert

The concept of desert is deeply entrenched in everyday morality. We say that effort deserves success, wrongdoing deserves punishment, innocent suffering deserves sympathy or compensation, virtue deserves happiness, and so on. We think that the getting of what's deserved is *just*, and that failure to receive what's deserved is *unjust*. We also believe it's *good* that a person gets what she deserves, and *bad* that she doesn't — even if she deserves something bad, like punishment. We assume, too, that it's *wrong* to treat people better or worse than they deserve, and *right* to treat them according to their deserts. In these and other ways, the notion of desert pervades our ethical lives.

In spite of its ubiquity, or perhaps because of it, the notion of desert is not especially well understood. This isn't surprising, since there are many difficult questions surrounding desert. For instance, what are the ingredients (as it were) of desert? What sorts of thing can be deserving? What are the grounds or bases for desert? How do bases for desert manage to make a thing that has them deserving? What connections does desert have to other moral-normative concepts, such as justice and goodness? This article sketches some possible answers to these and subsidiary questions about desert.

1. The Ingredients of Desert

Consider some ordinary desert claims: "Hans deserves praise in virtue of his efforts," "Because of her outstanding scholarly contributions, Nkechi deserves promotion to full professor," "Financial compensation is what the innocent victims of September 11 deserve." These desert claims have several things in common: each involves a deserving *subject* (Hans, Nkechi, innocent victims), a deserved *object*

(praise, promotion, compensation) and a desert *basis* (effort, contribution, innocent suffering). This suggests that desert itself is a three-place relation that holds among a subject, an object, and a basis. Of course, sometimes the desert claims we utter do not explicitly refer to all three of these ingredients. For example, one might say that Hans deserves praise (without specifying the basis of his desert), or that Nkechi is deserving (without specifying what she deserves). But unless one can fill these claims out further -- say, by explaining why one thinks that Hans deserves praise, or what it is one thinks that Nkechi deserves -- then the concept of desert is being misused.

It might be thought that desert involves more than three ingredients -- more, that is, than a basis, object, and subject. This thought might be due to reflection on desert claims like these: “In virtue of his efforts, Hans deserves praise *from his teacher*,” “Because of her scholarly contributions, Nkechi deserves *from the University* the position of full professor,” “Financial compensation *from groups that sponsor terrorism* is what the victims of September 11 deserve.” These desert claims specify a "source" from which the subject deserves the object. Hans deserves praise not from just anyone, but from his teacher. Nkechi deserves promotion not just by any institution, but by her university. The victims of September 11 deserve compensation not from just any group, but from those who harbor terrorists. Thus, it might be supposed that desert has four ingredients: a basis, a subject, an object, and its source (Kleinig 1971).

There are two reasons to resist adding this fourth ingredient to desert. One is that some legitimate cases of desert involve either no object-source, or an object-source so general that specifying it would be otiose. For example, you might deserve some good fortune after a long streak of undeserved bad luck, even though the good luck you now deserve is not deserved from any particular source. Or, in virtue of being a person, you might deserve respect -- but from whom? Well, everyone! A second reason for not allowing an independent fourth ingredient (the object-source) into desert is that in fact it is already contained in one of the undisputed ingredients -- namely, the desert object itself. For example, the object of Hans’s desert is not simply praise, but *praise from his teacher*; the object of Nkechi’s desert is not simply promotion, but *promotion by her university*; and so on. In these cases, the desert object includes a specific source. In other cases, the desert object will not involve a specific source -- as when you deserve good luck from no particular source, or respect from everyone.

2. Subjects of Desert

The most uncontroversial bearers of desert are human beings. Humans are thought to deserve, or be capable of deserving, many things: punishment, reward, apologies, compensation, admiration, contempt, wages, grades, prizes, and so on. But is desert limited to human beings? Can non-human animals, for example, be deserving too?

A conservative view is that *only* humans can be deserving, and that any attribution of desert to non-humans is either incoherent, false, or translatable into some claim of "human" desert, or perhaps into a claim that does not mention desert at all. So, for example, suppose someone says “The dog deserves a treat.” On the conservative view, this claim could be incoherent, since dogs (it is claimed) neither deserve nor fail to deserve anything. The concept of desert simply does not apply to them. Or it could be

coherent but false: the dog does not deserve a treat, since dogs cannot literally deserve anything. Or it could be coherent and even true, provided that it's translatable without change of meaning into some other claim, e.g., "You deserve the satisfaction of giving your dog a treat," or "Giving the dog a treat will reinforce its good behavior."

This view seems a bit *too* conservative. First, it flies in the face of the way we ordinarily apply the concept of desert. Indeed, if ordinary language is any guide, then just about anything can be literally deserving. For in addition to making desert claims about humans, we also say, for example, that the pet deserves our love, the Olympic Peninsula our respect, the proposal our support, the nation our loyalty, the painting our admiration. (It's possible that some of these claims are translatable in ways that would be consistent with the conservative view, but it's not obvious that all of them are. The burden of proof -- and of translation! -- is on the conservatives.) Second, what makes a human being capable of desert probably is not the biological fact that she is a human being -- that is, a member of the species *Homo sapiens*. It might instead be the fact that she is capable of reason or self-reflection, or that she is capable of experiencing pain and pleasure. If so, then since there are non-human creatures (e.g., dogs) who can either reason or experience pain and pleasure, then at least some non-human creatures are subjects of desert too.

Unfortunately, this isn't saying very much. For one thing, it's not clear *how* having the ability to reason or experience pleasure or pain would make a creature capable of being deserving. Furthermore, it's not obvious that possession of one or more of those abilities is even necessary for being a subject of desert. Dead people, who don't have those abilities, are sometimes thought to deserve various things, such as a decent burial. Likewise, inanimate objects -- such as the Grand Canyon or Big Ben -- are also said to deserve certain things, such as preservation or protection.

Clearly, the question of what is necessary or sufficient for being a subject of desert is a difficult one. Is there any way to answer it? One possibility suggests itself: first, draw up a list of the possible bases of desert; then look around and see what sorts of things can have them. The result would be at least a partial catalogue of the sorts of things that can be deserving. In order to do this, of course, we would need a list of possible desert bases. What would that list look like? What are the bases for desert?

3. Bases for Desert

Suppose we are asked to draw up a list of the bases for desert -- that is, a catalogue of the sorts of things such that having any of them would make a subject deserving. What would go on the list, and how would each entry be justified? We might agree that effort, for example, is a basis for deserving reward or success, but we might be less sure about whether *need*, for instance, is a basis for deserving medical care, or whether *moral worth* is a basis for deserving happiness. In order to settle such doubts and arrive at a justifiable catalogue, some general and defensible principles for identifying desert bases seem necessary.

There is agreement that the basis of a thing's desert must in some important sense be a fact "about" that thing (Feinberg 1970). So, for example, the fact that 3 is a prime number, or that a particular star is two

billion years old, is not a basis for your deserving anything. In order for a fact to be a basis of your desert, it must be a fact about you -- for example, that you have worked hard, innocently suffered, are a person, and so on. So the basis of a thing's desert must be a fact about that thing. Is there anything more that can be said?

Many writers have claimed that another necessary condition on something's being a desert base is that the deserving subject is *responsible* for it (see Cupit 1996a and Feldman 1995b, 1996 for references and discussion). A standard version of this condition can be stated as follows:

> (DR) *A* deserves *x* in virtue of *y* only if *A* is responsible for *y*.

DR is plausible at first glance, and there are many cases that seem to support it. If, for instance, a professor discovers that his student isn't responsible for the high-quality paper she submitted (because she stole it from the Internet), then she can't deserve a good grade for it. Or consider the fact that criminal action deserves punishment, but not if the agent was insane at the time of the action. Presumably, the justification for this is that an insane agent is not responsible for his or her actions, and no one deserves punishment for actions for which he or she isn't responsible.

DR plays a central role in contemporary discussions about desert. It occurs, for instance, in a much-discussed argument for the conclusion that no one deserves anything. (This argument is suggested by some passages in Rawls 1971, though it's not clear that Rawls himself means to endorse the following versions of it. See Miller 1976 for discussion.) The argument goes something like this: all the actions we perform and attributes we possess -- in short, all would-be bases for desert -- are determined by factors for which we are not responsible, such as our genetic makeup, early training, and environment. But if no one is responsible for his or her possession of any would-be basis for desert, then these are not bases for desert at all (*DR*). Therefore, no one deserves anything. On another version of this argument, it involves an extra premise: if *A* deserves *x* in virtue of *y*, then *A* must also deserve *y* (Nozick 1974 and Zaitchik 1977 add this premise to the argument, and both reject it). So, for example, Rostropovich deserves praise for his musical talent only if he deserves to have that talent. But does he? This is where *DR* comes in. For if *DR* is true, then Rostropovich can deserve his musical talent only if he's responsible for it -- which he isn't, since he was born with it. Thus, he can't deserve praise for it. Likewise, it's argued, for any alleged desert base: no one could deserve to have any so-called desert base, since no one is responsible for having such things. Thus, once again, no one deserves anything.

DR appears elsewhere in theorizing about desert. A good example is found in the literature on desert of wages. Much of this literature centers on the question of whether the wage a worker deserves depends on the effort exerted (regardless of actual productivity), or on productivity (regardless of effort). Sometimes the following argument is proposed: wages are deserved either for effort or productivity; people are responsible only for their efforts, not for the success or productivity of those efforts; DR is true; thus, it's the worker's effort, not productivity, that determines the deserved wage. (For more discussion of this argument, see Lamont 1994, McLeod 1996, and Sadurski 1985.)

In spite of *DR*s intuitive appeal and wide acceptance, it has not gone unchallenged. To some, it seems obvious that we can be deserving in virtue of things for which we are not responsible (Cupit 1996a, Feldman 1995b, 1996). Consider a person who innocently suffers a brutal mugging. The victim is not responsible for the attack, but deserves compensation anyway. Or consider a person who innocently suffers an excruciating disease that is very expensive to treat. She is not responsible for contracting this disease, yet she might deserve medical care and sympathy. Or consider the fact that you are a person. No one is responsible for this, yet in virtue of being a person you deserve a modicum of respect. These examples suggest that if there is a connection between desert and responsibility, it's more complicated than the one posited by *DR*. (For more discussion of the connection, see Secton 5.4 below, as well as Cupit 1996a,b and Smilansky 1996a, b.)

Another attempt to place conditions on desert bases does so by attempting to link them with certain emotions or attitudes (Miller 1976). A version of this view begins by calling attention to the class of attitudes that we take up toward people in virtue of various qualities they possess or actions they perform. Those attitudes include admiration, gratitude, disgust, resentment, and so on. These have been called the "appraising attitudes". The idea here is that the bases for appraising attitudes are, or at least coincide with, the bases for desert. Put another way:

> (DAA) *x* is a desert base if and only if *x* is the basis of an appraising attitude.

If correct, *DAA* would provide a useful principle for determining what the desert bases are. For example, it's sometimes held that need is a basis for desert (say, of medical care). Yet need doesn't seem to be the basis of any appraising attitude. We don't respect or resent people, admire or detest them, because of their needs. Thus, if *DAA* is true, then need isn't a basis for desert. On the other hand, it seems that exerting effort (for example) is a basis for admiring a person. If *DAA* is true, it follows that effort is a basis for desert.

However, there may be a problem with *DAA*. To see it, consider the distinction between something's actually being admired or resented, on the one hand, and that thing's being *appropriately* admired or resented on the other. For example, many admired Hitler even though it would have been appropriate to detest him. And many resented Martin Luther King, Jr., even though it would have been appropriate to admire him. This allows us to ask: is *DAA* the thesis that *x* is a basis for desert if and only if *x* happens to be the object of an appraising attitude? Or is it instead the view that *x* is a basis for desert if and only if *x* is an appropriate basis for an appraising attitude? If the former, then *DAA* reduces to an implausible form of relativism about desert bases. (Desert bases would be properties whose presence we just happened to admire or detest, even if we admired nasty properties and detested noble ones.) If the latter, then *DAA* is in danger of being vacuous. For what else could make *x* an "appropriate" basis for an appraising attitude, except for the fact that those who have *x* *deserve* to be the object of that attitude?

Still another way of attempting to determine the bases for desert proceeds in two stages (Feinberg 1970). First, draw up a list of all the sorts of treatment that can be deserved: prizes, rewards, punishments, grades, compensation, and so on. Second, for each form of treatment, attempt to specify the basis or

bases for which it is deserved. There are two potential problems with this approach. First, just as it is difficult to draw up a catalogue of bases for desert, it is hard to draw up a list of forms of deservable treatment. Second, this way of proceeding might reinforce the assumption that for every sort of deservable treatment, there is a desert base or set of desert bases unique to it. This assumption may be correct, but another possibility is that there is a single set of desert bases, and possession of any or all of them can influence the extent to which one deserves any given form of deservable treatment. If this latter view of the relationship between desert bases and deserved treatment is correct, then attempting to match deserved treatments to their bases might not be the best way to determine the bases of desert (McLeod 1996).

Yet another method for determining desert bases follows directly from an "institutional" theory of desert (Cummisky 1987, Arnold 1987). On that sort of theory, the bases for desert are determined by the rules or purposes of social institutions. For example, if the purpose of the ‘institution’ of Olympic gymnastics is to award the gold medal to the gymnast who receives the highest number of points from the judges, then the gymnast who achieves that score deserves the gold medal. If a theory of this sort is correct, then discovering the bases for desert will be as easy (or as difficult) as discovering the rules or purposes of social institutions. A possible source of trouble for this view, however, is that desert bases do not seem to be entirely determined by the rules or purposes of social institutions. Otherwise morally repugnant rules such as racist restrictions on voting eligibility, sexist restrictions on employee benefits, and so on, could not be fairly criticized on the grounds that race, gender, and so on are not legitimate grounds for deserving the loss of such benefits. But such criticism certainly seems warranted. This has persuaded some writers that there are "pre-institutional" facts about the bases for desert, and that social rules and purposes can be evaluated in terms of them (Feinberg 1970, McLeod 1999).

4. How desert bases work

How do desert bases work? In particular, how does possession of a basis for desert manage to make its possessor deserving? The difficulty of this question can be brought out by imagining a person who has, for example, exerted quite a lot of *effort* toward achieving some end. Effort is widely thought to be a basis for desert, so let’s suppose that it is. Would this mean that the person who exerted effort now deserves to achieve his end? One reason to doubt this is that his end might have been an *evil* one -- for example, the bombing of a building full of innocent people. Surely he can’t deserve that this horrible end be realized, no matter how hard he works for it. So maybe we should add that effort is a basis for desert only if it’s directed toward a morally unobjectionable end. If correct, this would explain why the terrorist can’t deserve that his efforts succeed. After all, those efforts are directed toward the morally objectionable end of murdering innocent people.

However, it’s probably a mistake to conclude that exerting effort toward a morally unobjectionable end is *sufficient* for deserving the end itself. This is because there might be other factors at work that could weigh against one’s deserving it, even if the end itself is morally okay. For example, suppose you’ve worked hard toward getting an A on your term paper. You spent hours in the library doing research, you composed several drafts, you went hours without sleep, and so on. Your end is morally okay, since

there's nothing wrong with trying (in these ways!) to get an A. Even so, it's still possible that, in spite of your tremendous efforts, your paper is terrible. In that case, you probably don't deserve an A.

The general phenomenon emerging here is that, at least in many cases, possession of any particular basis for desert is not going to be sufficient for being deserving. You might work hard toward an end, but what if the end itself is wrong? Or the end is okay, and your effort intense, but what if the product of your effort is of very low quality? Even if the product of your effort is of high quality, you still might not be deserving, since other factors could count against you. Until all these of factors are taken into consideration and weighed against each other, it's impossible to render a verdict of desert.

This sort of phenomenon is not unprecedented. In fact it comes up often in philosophical ethics, most notably in theorizing about moral rightness and wrongness. There, it's standard to distinguish *prima facie* moral rightness from *all-things-considered* moral rightness (Ross 1930). To illustrate this distinction, imagine that you've made a solemn promise to help your friend. In virtue of this, it would be morally right, in some sense, for you to keep your promise. However, the rightness here is merely *prima facie*, for it might not be all-things-considered morally right for you to help your friend. This is because your promise might, for example, have been to help your friend by murdering his enemy (who, let's suppose, is an innocent person). In that case, you almost certainly have an all-things-considered obligation to break your promise. Still, the fact that you made a solemn promise to perform a certain action does seem to count toward the action's being right. For in other circumstances, a solemn promise to do something could generate an all-things-considered obligation to do it. It just so happens that, in this case, the *prima facie* rightness that the act would inherit in virtue of being a promise-keeping is outweighed by the *prima facie* wrongness of committing murder. Thus, on this way of thinking, the all-things-considered rightness or wrongness of any action is determined by all the respects in which the action would be *prima facie* right, when weighed against all the respects in which it would be *prima facie* wrong.

It might be that desert bases work in a similar way. That is, there might be a distinction between *prima facie* desert and *all-things-considered* desert. Possession of any given desert base makes one *prima facie* deserving, but it might not make one all-things-considered deserving. For example, you might have exerted intense effort toward achieving some end. If, as is usually held, effort is a basis for deserving success, then you *prima facie* deserve success in virtue of your effort. However, you might not be all-things-considered deserving of success. Perhaps this is because your effort was directed toward an evil end. In such a case, the *prima facie* desert of success that you gained in virtue of exerting effort is outweighed by the *prima facie* desert of failure and punishment that you acquired in virtue of plotting an evil end. If these are all the desert bases in play, then you all-things-considered deserve failure and punishment, not success.

The obvious drawback to thinking of desert bases as functioning in this way is that the method, if any, for determining the weight or importance of desert bases in particular cases is pretty mysterious. How, for instance, are we to weigh effort against productivity in the context of deserving a wage, or moral worth against need in the context of deserving medical care, or a person's humanity against his criminal behavior in the context of deserving punishment? Until we have some principled way of weighing *prima facie* desert bases against each other, the distinction between *prima facie* and all-things-considered desert

might serve only to describe, rather than solve, the problem of how desert bases work.

An alternative approach would involve abandoning the distinction between *prima facie* and all-things-considered desert, and working toward a catalogue of more “finely-grained” desert bases. The idea here is that if the desert bases are specified in enough detail, then the relationship between having them and being deserving would be simple: possession of a desert base would be sufficient for being deserving. On this sort of view, effort itself, for example, is not a basis for desert, nor is effort-directed-toward-a-morally-unobjectionable-end, since neither one seems sufficient for being deserving (say, of an A on a paper). Instead, possession of a much more complicated desert base -- viz., effort-directed-toward-a-morally-unobjectionable-end-that-is-not-also-a-grade-on-a-paper-etc. -- is sufficient for desert.

This kind of view has the advantage of positing a simple relationship between possessing a desert base and being deserving. That relationship is this: possession of the desert base *entails* being deserving. However, this simplicity is purchased at the cost of making the desert bases themselves hopelessly complicated. The prior view, by contrast, makes desert bases very simple (e.g., ‘effort’, ‘productivity’, ‘moral worth’), but the price for this simplicity is a complicated and admittedly mysterious relationship between possessing desert bases and being deserving.

5. Desert’s Relationship to Some Other Concepts

Fully grasping a concept involves understanding its relationships to other concepts. Thus, in order to fully grasp the concept of desert, it’s important to see what connections it has to other concepts. Desert probably bears interesting connections to a large number of concepts, but this concluding section focuses only on four: justice, intrinsic value, entitlement, and responsibility.

5.1 Justice

There are many theories of justice (and, some would say, many sorts of justice -- distributive, retributive, social, etc. -- for there to be theories about). Some of these theories are egalitarian, since they state that some sort of equality is most central to justice. Other theories of justice are libertarian, because of the supreme importance that they place on liberty or freedom. But an ancient idea is that justice involves the getting of what’s deserved -- even if this results in inequalities, and even if distribution according to desert involves or requires some loss of liberty. On an old-fashioned version of this view, for instance, justice obtains entirely to the extent that the morally virtuous are happy, and the morally wicked suffer. If happiness were somehow to be distributed according to moral goodness in this way, the result would be inequality with respect to happiness, since the more virtuous would be happier than the less virtuous. There would also be a loss of liberty or freedom for the morally wicked, since they would be punished or otherwise made to suffer. But these inequalities and losses of freedom wouldn’t detract from the justice of the world; instead, they would be required by justice itself.

However, contemporary theorists don’t agree about the relationship between justice and desert. Some

seem willing to accept that justice is entirely a matter of getting what's deserved (Feldman 1992, 1995a, 1995c). A more moderate position is that getting what's deserved is part, but only a part, of justice (Feinberg 1974, Lucas 1980, Slote 1973). Another possible component of justice is *fairness*, which has to do with the way one's treatment compares to the treatment received by others. Suppose, for example, that every student in the class deserves a C, but one of them is arbitrarily given an A and the rest are given Cs. Some will say, quite plausibly, that although these other students are given the grades they deserve, they are treated unjustly because they are treated unfairly. If this is correct, then justice cannot consist simply in getting what's deserved. Other factors, such as fairness, might be relevant to justice as well (Feinberg 1974). Another such factor might be *consent*. For suppose a person has worked hard to earn money, for example, and thereby comes to deserve it. Even so, there is no injustice if the person freely consents to giving this money away (Slote 1973).

Some theorists have gone so far as to argue that desert has nothing at all to do with justice. This view contradicts commonsense morality, but the arguments for holding it have been influential. One such argument is that the concept of desert, rather than providing a basis for the explanation of justice, is in fact conceptually parasitic on the notion of justice. On this way of seeing things, to deserve something is to be entitled to it according to rules that are just. The justice of these rules is then explained not in terms of how well or regularly they result in deserved distributions, which would be circular, but rather by some criterion (such as agreement on those rules by rational parties) that has nothing to do with desert (Rawls 1971, Scanlon 1984). The motivation behind a view like this might be that a more robust notion of desert would involve metaphysical mysteries, such as freedom or responsibility (Scheffler 1995). Or perhaps the motivation is simply the pragmatic one that any system designed to distribute goods and evils according to individual deserts would be hopelessly impractical (Rawls 1971). For how could we determine each individual's moral worth, level of effort, productivity, and so on, and then distribute benefits and burdens accordingly?

There is another argument for thinking that desert is irrelevant to justice -- or, more precisely, that distribution according to 'desert' would actually involve *injustice*. This argument relies on the intuition that just distributions cannot be based on factors over which the recipients have no control. The distribution of economic and political benefits according to race or gender, for instance, seems unjust since neither one's race nor gender is within one's control. But what if the alleged bases for desert -- effort, moral worth, productivity, being a person, and so on -- are also beyond or largely outside of one's control, and due instead to factors such as such as genetic endowment and early training? It would seem to follow that distributions based on these factors, these "desert bases", are unjust (Rawls 1971).

5.2 Intrinsic value

The *intrinsic* value of a thing is the value it has simply in virtue of what it is, rather than the value it has in virtue of what it leads to, signifies, entails, purchases, and so on. (For reasons that can't be discussed here, the concept of intrinsic value is of central importance in philosophical ethics.) The branch of ethics concerned with intrinsic value is known as *axiology*. A helpful assumption often made in axiology is that intrinsic value is had not just by anything at all, but rather by states of affairs or propositions. And one of

the central questions in axiology is this: what elements can contribute to the intrinsic value of a state of affairs?

Some have argued that one such element involves desert (Feldman 1992, 1995c, Kagan 1999; Hurka 2001). To see why, consider two states of affairs: (i) that Smith is happy, and (ii) that Jones is unhappy. What is the intrinsic value of these states of affairs? One might suppose that (i) is intrinsically good, since happiness seems a likely constituent of intrinsically good states of affairs, and that (ii) is intrinsically bad, since unhappiness seems a likely ingredient of intrinsically bad states of affairs. So far, so good. However, it might be that happiness and unhappiness are not the only contributors to the intrinsic values of states of affairs. Another such factor might be the "fit" between the happiness or unhappiness *received*, on the one hand, and the happiness or unhappiness *deserved*, on the other. For suppose that Smith and Jones are morally despicable people, and that therefore their happiness is undeserved. In that case, it seems wrong to say that (i) is intrinsically good and (ii) intrinsically bad. On the contrary, a more plausible view is that (i) is intrinsically bad and (ii) intrinsically good! In any case, an intuitively appealing position is that a state of affairs in which a person who deserves unhappiness but receives happiness is intrinsically bad, and a state of affairs in which a person who deserves unhappiness and gets it is not intrinsically bad, and quite possibly intrinsically good. If this is correct, then the fit between desert and receipt within a state of affairs is at least one determinant of its intrinsic value.

That said, the quality of fit between desert and receipt is almost surely not the only determinant of intrinsic value (Persson 1996). Compare, for instance, two possible worlds (here thought of as extremely large states of affairs). One world contains a million sinners, all of whom suffer the horrible punishment that they deserve. Another world contains a million saints, all of whom enjoy the bliss that they deserve. These are rather different worlds, but in one respect they are the same: the quality of fit between desert and receipt in the sinners' world is equal to that of the saints' world. This is because the fit in each world is perfect: each person in each world receives precisely what he or she deserves, and the worlds have the same population. However, it seems absurd to say that these worlds have the same intrinsic value. On the contrary, the sinners' world seems intrinsically much worse than the saints'. If so, then the intrinsic value of a state of affairs is not exhausted by the quality of fit between desert and receipt.

5.3 Entitlement

We often speak of being *entitled* to something, like a vacation, a grade, an inheritance, or an apology. Notice, however, that in many of these cases we could just as easily have said that we *deserve* these things. Thus, the terms 'entitled to' and 'deserve' are often used interchangeably. This raises the question of desert's relationship to entitlement. Are they one and the same, or are they different? And if they are distinct notions, then what connection, if any, does desert bear to entitlement?

First, though, what exactly is entitlement? Reflecting on a few cases can bring out the sense of 'entitlement' of interest here. Suppose, then, that the rules of a certain corporation state that its employees shall receive two weeks of paid vacation after one year of full-time employment. Now suppose that an employee of the company has worked full-time for one year. This employee is now entitled to two weeks

of paid vacation. Or, to take another example, suppose the rules of a certain board game specify that a player who rolls "snake eyes" must lose a turn. If a player now rolls snake eyes, then that player is "entitled" to lose a turn. (Admittedly, we don't usually think of penalties as objects of entitlement, but, in the sense of 'entitlement' that concerns us, they can be.) Suppose, as a final example, that the accepted rules of etiquette state that the hostess of an upcoming dinner party shall receive RSVPs from her invited guests, even if she fails to request the favor of a response. In that case, the hostess is entitled to a response from all her invitees. These cases have several things in common. First, there is a conventional rule that specifies that a person shall receive a certain treatment in virtue of possessing an "entitlement base" (that is, a particular attribute or performance of a certain action). Second, there is a person who falls under the rule and who has the entitlement base. Third, this person thereby comes to be entitled to the treatment in question. These are paradigmatic cases of entitlement.

Clearly, entitlement thus understood is structurally similar to desert. For entitlement, like desert, is a three-place relation among an entitled subject, a basis of entitlement, and an object of entitlement. Also, as noted above, many objects of entitlement -- vacations, punishment, replies to invitations -- are also objects of desert. Furthermore, failure to treat in accordance with entitlement, like failure to treat in accordance with desert, can be an injustice. These considerations might lead some to conclude that there is a profound relationship between entitlement and desert.

Some might want to say that the relationship between desert and entitlement is extremely intimate. Indeed, the "institutional" theories of desert mentioned in Section 3 are precisely those that *identify* desert with some sort of entitlement. However, this proposed connection (identity) is a bit too intimate, for there are cases in which a person is entitled to something but doesn't deserve it, and also cases in which what's deserved isn't something to which the person is entitled. For instance, the rules that govern the state lottery might entitle the winning ticket holder to one hundred million dollars, even if the lucky winner doesn't deserve so much money. Or, it might be that everyone in the United States deserves free or affordable access to basic health care, even though there are no rules that entitle us to it. These cases suggest that if there is an interesting relationship between desert and entitlement, it isn't identity.

At least some authors have claimed that although entitlement is not identical to desert, it is nevertheless a basis for desert (Feldman 1992, 1995a; McLeod 1999). On their view, being entitled to something is a basis for deserving it. Perhaps the main motivation for this position springs from combining the conviction that justice is simply the getting of what's deserved with the apparent fact that failing to treat in accordance with entitlement can involve injustice. If this combination of views is correct, it would seem to follow that being entitled to something must be a basis for deserving it. But this view also suffers from serious problems. One is its implication that evil or morally repugnant rules are capable of generating desert. Suppose, for example, that Nazi laws entitled officers of the SS to property confiscated from Jews. Even so, it hardly seems correct to say that, in virtue of this, the Nazi officers came to deserve (even prima facie) the stolen property. Another problem with the view that entitlement is a basis for desert is that it seems to violate the requirement that a desert basis must be a fact about the deserving subject. Unlike the property of being morally virtuous or being lazy, the property of being entitled by the rules to x is a highly extrinsic property of an individual, and thus cannot count as a basis for desert.

A third proposed connection between desert and entitlement is found in Cupit (1996b). Suppose, for purposes of illustration, that the orchestra has just pulled off an electrifying performance of Dvorak's Ninth Symphony. The musicians deserve the audience's admiration, and there are rules for how it can be expressed. If, as in this case, their admiration is immense, then the rules call for a standing ovation. Put another way, there is a rule that entitles the musicians to a standing ovation from the audience. Thus, if the audience fails to give the orchestra a standing ovation, the message is conveyed that the musicians don't deserve it. In other words, if the audience fails to give the players that to which they are entitled, then it fails to give them what they deserve. In this way, a link seems to be forged between desert and entitlement: the rules that generate entitlement also help to shape the meanings of the actions that fall under those rules; those actions are meant to express what the recipient deserves; therefore, failure to treat in accordance with entitlement can result in failure to treat in accordance with desert.

5.4 Responsibility

Much of the relevant literature presupposes or explicitly considers some conception of the relationship, if any, that desert bears to the concept of *responsibility*. As noted in Section 3, some authors (e.g., Rawls 1971, Rachels 1978, Pojman 1997) claim that desert always presupposes responsibility. On their view, one cannot deserve anything in virtue of an action or attribute for which one isn't responsible. Feldman (1995a), Cupit (1996a, b), and others challenge this claim by pointing to properties that seem to be bases for desert but that do not presuppose responsibility. Innocent suffering, being a person, being beautiful, being a member of an endangered species - all of these properties are plausibly regarded as bases for desert of various forms of treatment, such as compensation, respect, admiration, protection, and so on, in spite of the fact that one need not be responsible for possessing them. Thus, it seems that if there is a desert-responsibility connection, it's not as simple as some have thought.

There are ways in which proponents of the view that desert always involves responsibility might deal these apparent counterexamples. One is to distinguish "moral" from "nonmoral" desert -- moral desert presupposes responsibility, while nonmoral desert does not -- and to relegate nonmoral desert to the philosophical scrap heap. But this maneuver seems both *ad hoc* and implausible: *ad hoc* because what motivates the distinction is simply a desire to save the alleged desert-responsibility connection; implausible because treatment (or failure to treat) in accordance with innocent suffering, being a person, being beautiful, etc., doesn't really seem to be nonmoral. On the contrary, failure to treat in accordance with a thing's possession of one or more of those properties would be unfitting or wrong, while treatment in accordance with one or more of them would be fitting or right. A similar objection applies to treating desert as a species of "merit". On this view, merit is based on possession of any quality that is an appropriate basis for treatment, whether the meriting subject is responsible for the quality or not, while desert is a species of merit that requires responsibility for the merit basis (Pojman 1997). This too is *ad hoc*, since ordinary language doesn't support a sharp merit-desert distinction. It also contradicts the actual practice of competent speakers who readily speak of desert in cases where the subject isn't responsible for the basis.

This isn't to say that desert and responsibility are not connected in any way. In fact, there are cases where

desert does require responsibility (perhaps the most obvious is punishment). Thus, rather than focus on simple versions of a desert-responsibility connection, theorists of desert should distinguish those cases in which desert involves responsibility from those in which it does not, and articulate general principles that explain the difference.

Globalization

Covering a wide range of distinct political, economic, and cultural trends, the term “globalization” has quickly become one of the most fashionable buzzwords of contemporary political and academic debate. In popular discourse, globalization often functions as little more than a synonym for one or more of the following phenomena: the pursuit of classical liberal (or “free market”) policies in the world economy (“economic liberalization”), the growing dominance of western (or even American) forms of political, economic, and cultural life (“westernization” or “Americanization”), the proliferation of new information technologies (the “Internet Revolution”), as well as the notion that humanity stands at the threshold of realizing one single unified community in which major sources of social conflict have vanished (“global integration”). Fortunately, recent social theory has formulated a more precise concept of globalization than those typically offered by pundits. Although sharp differences continue to separate participants in the ongoing debate, most contemporary social theorists endorse the view that globalization refers to fundamental changes in the spatial and temporal contours of social existence, according to which the significance of space or territory undergoes shifts in the face of a no less dramatic acceleration in the temporal structure of crucial forms of human activity. Geographical distance is typically measured in time. As the time necessary to connect distinct geographical locations is reduced, distance or space undergoes compression or “annihilation.” The human experience of space is intimately connected to the temporal structure of those activities by means of which we experience space. Changes in the temporality of human activity inevitably generate altered experiences of space or territory. Theorists of globalization disagree about the precise sources of recent shifts in the spatial and temporal contours of human life. Nonetheless, they generally agree that alterations in humanity's experiences of space and time are working to undermine the importance of local and even national boundaries in many arenas of human endeavor. Since globalization contains far-reaching implications for virtually every facet of human life, it necessarily suggests the need to rethink key questions of normative political theory.

1. Globalization in the History of Ideas

The term globalization has only become commonplace in the last two decades, and academic commentators who employed the term as late as the 1970s accurately recognized the novelty of doing so (Modelski, 1972). At least since the advent of industrial capitalism, however, intellectual discourse has been replete with allusions to phenomena strikingly akin to those that have garnered the attention of recent theorists of globalization. Nineteenth and twentieth-century philosophy, literature, and social commentary include numerous references to an inchoate yet widely shared awareness that experiences of distance and space are inevitably transformed by the emergence of high-speed forms of transportation (for example, rail and air travel) and communication (the telegraph or telephone) that dramatically heighten possibilities for human interaction across existing geographical and political divides (Harvey, 1989; Kern, 1983). Long before the introduction of the term globalization into recent popular and scholarly debate, the appearance of novel high-speed forms of social activity generated extensive commentary about the compression of space.

Writing in 1839, an English journalist commented on the implications of rail travel by anxiously postulating that as distance was “annihilated, the surface of our country would, as it were, shrivel in size until it became not much bigger than one immense city” (Harvey, 1996: 242). A few years later, Heinrich Heine, the émigré German-Jewish poet, captured this same experience when he noted: “space is killed by the railways. I feel as if the mountains and forests of all countries were advancing on Paris. Even now, I can smell the German linden trees; the North Sea's breakers are rolling against my door” (Schivelbusch, 1978: 34). Another German émigré, the socialist theorist Karl Marx, in 1848 formulated the first theoretical explanation of the sense of territorial compression that so fascinated his contemporaries. In Marx's account, the imperatives of capitalist production inevitably drove the bourgeoisie to “nestle everywhere, settle everywhere, and establish connections everywhere.” The juggernaut of industrial capitalism constituted the most basic source of technologies resulting in the annihilation of space, helping to pave the way for “intercourse in every direction, universal interdependence of nations,” in contrast to a narrow-minded provincialism that had plagued humanity for untold eons (Marx, 1979 [1848]: 476). Despite their ills as instruments of capitalist exploitation, new technologies that increased possibilities for human interaction across borders ultimately represented a progressive force in history. They provided the necessary infrastructure for a cosmopolitan future socialist civilization, while simultaneously functioning in the present as indispensable organizational tools for a working class destined to undertake a revolution no less oblivious to traditional territorial divisions than the system of capitalist exploitation it hoped to dismantle.

European intellectuals have hardly been alone in their fascination with the experience of territorial compression, as evinced by the key role played by the same theme in early twentieth-century American thought. In 1904, the literary figure Henry Adams diagnosed the existence of a “law of acceleration,” fundamental to the workings of social development, in order to make sense of the rapidly changing spatial and temporal contours of human activity. Modern society could only be properly understood if the seemingly irrepressible acceleration of basic technological and social processes was given a central place in social and historical analysis (Adams, 1931 [1904]). John Dewey argued in 1927 that recent economic

and technological trends implied the emergence of a “new world” no less noteworthy than the opening up of America to European exploration and conquest in 1492. For Dewey, the invention of steam, electricity, and the telephone offered formidable challenges to relatively static and homogeneous forms of local community life that had long represented the main theatre for most human activity. Economic activity increasingly exploded the confines of local communities to a degree that would have stunned our historical predecessors, for example, while the steamship, railroad, automobile, and air travel considerably intensified rates of geographical mobility. Dewey went beyond previous discussions of the changing temporal and spatial contours of human activity, however, by suggesting that the compression of space posed fundamental questions for democracy. Dewey observed that small-scale political communities (for example, the New England township), a crucial site for the exercise of effective democratic participation, seemed ever more peripheral to the great issues of an interconnected world. Increasingly dense networks of social ties across borders rendered local forms of self-government ineffective. Dewey wondered, “How can a public be organized, we may ask, when literally it does not stay in place?” (Dewey, 1954 [1927]: 140). To the extent that democratic citizenship minimally presupposes the possibility of action in concert with others, how might citizenship be sustained in a social world subject to ever more astonishing possibilities for movement and mobility? New high-speed technologies attributed a shifting and unstable character to social life, as demonstrated by increased rates of change and turnover in many arenas of activity (most important perhaps, the economy) directly affected by them, and the relative fluidity and inconstancy of social relations there. If citizenship requires some modicum of constancy and stability in social life, however, did not recent changes in the temporal and spatial conditions of human activity bode poorly for political participation? How might citizens come together and act in concert when contemporary society's “mania for motion and speed” made it difficult for them even to get acquainted with one another, let alone identify objects of common concern? (Dewey, 1954 [1927]: 140).

The unabated proliferation of high-speed technologies is probably the main source of the numerous references in intellectual life since 1950 to the annihilation of distance. The Canadian cultural critic Marshall McLuhan made the theme of a technologically based “global village,” generated by social “acceleration at all levels of human organization,” the centerpiece of an anxiety-ridden analysis of new media technologies in the 1960s (McLuhan, 1964: 103). Arguing in the 1970s and '80s that recent shifts in the spatial and temporal contours of social life exacerbated authoritarian political trends, the French social critic Paul Virilio seemed to confirm many of Dewey's darkest worries about the decay of democracy. According to his analysis, the high-speed imperatives of modern warfare and weapons systems strengthened the executive and debilitated representative legislatures. The compression of territory thereby paved the way for executive-centered emergency government (Virilio, 1986 [1977]). But it was probably the German philosopher Martin Heidegger who most clearly anticipated contemporary debates about globalization. Heidegger not only described the “abolition of distance” as a constitutive feature of our contemporary condition, but he linked recent shifts in spatial experience to no less fundamental alterations in the temporality of human activity: “All distances in time and space are shrinking. Man now reaches overnight, by places, places which formerly took weeks and months of travel” (Heidegger, 1971 [1950]: 165). Heidegger also accurately prophesied that new communication and information technologies would soon spawn novel possibilities for dramatically extending the scope of *virtual reality*: “Distant sites of the most ancient cultures are shown on film as if they stood this very

moment amidst today's street traffic…The peak of this abolition of every possibility of remoteness is reached by television, which will soon pervade and dominate the whole machinery of communication" (Heidegger, 1971 [1950]: 165). Heidegger's description of growing possibilities for simultaneity and instantaneousness in human experience ultimately proved no less apprehensive than the views of many of his predecessors. In his analysis, the compression of space increasingly meant that from the perspective of human experience "everything is equally far and equally near." Instead of opening up new possibilities for rich and multi-faceted interaction with events once distant from the purview of most individuals, the abolition of distance tended to generate a "uniform distanceless" in which fundamentally distinct objects became part of a bland homogeneous experiential mass (Heidegger, 1971 [1950]: 166). The loss of any meaningful distinction between "nearness" and "distance" contributed to a leveling down of human experience, which in turn spawned an indifference that rendered human experience monotonous and one-dimensional.

2. Globalization in Contemporary Social Theory

Since the mid-1980s, social theorists have moved beyond the relatively underdeveloped character of previous reflections on the compression or annihilation of space to offer a rigorous conception of globalization. To be sure, major disagreements remain about the precise nature of the causal forces behind globalization, with David Harvey (1989, 1996) building directly on Marx's pioneering explanation of globalization, while others (Giddens, 19990; Held, McGrew, Goldblatt, Perraton, 1999) question the exclusive focus on economic factors characteristic of the Marxist approach. Nonetheless, a consensus about the basic rudiments of the concept of globalization appears to be emerging.

First, contemporary analysts associate globalization with *deterritorialization*, according to which a growing variety of social activities takes place irrespective of the geographical location of participants. As Jan Aart Scholte observes, "global events can -- via telecommunication, digital computers, audiovisual media, rocketry and the like -- occur almost simultaneously anywhere and everywhere in the world" (Scholte, 1996: 45). Globalization refers to increased possibilities for action between and among people in situations where latitudinal and longitudinal location seems immaterial to the social activity at hand. Even though geographical location remains crucial for many undertakings (for example, farming to satisfy the needs of a local market), deterritorialization manifests itself in many social spheres. Business people on different continents now engage in electronic commerce; television allows people situated anywhere to observe the impact of terrible wars being waged far from the comfort of their living rooms; academics make use of the latest video conferencing equipment to organize seminars in which participants are located at disparate geographical locations; the Internet allows people to communicate instantaneously with each other notwithstanding vast geographical distances separating them. Territory in the sense of a traditional sense of a geographically identifiable location no longer constitutes the whole of "social space" in which human activity takes places. In this initial sense of the term, globalization refers to the spread of new forms of non-territorial social activity (Ruggie, 1993; Scholte, 2000).

Second, recent theorists conceive of globalization as linked to the growth of social *interconnectedness* across existing geographical and political boundaries. In this view, deterritorialization is a crucial facet of

globalization. Yet an exclusive focus on it would be misleading. Since the vast majority of human activities is still tied to a concrete geographical location, the more decisive facet of globalization concerns the manner in which distant events and forces impact on local and regional endeavors (Tomlinson, 1999: 9). For example, this encyclopedia might be seen as an example of a deterritorialized social space since it allows for the exchange of ideas in cyberspace. The only prerequisite for its use is access to the Internet. Although substantial inequalities in Internet access still exist, use of the encyclopedia is in principle unrelated to any specific geographical location. However, the reader may very well be making use of the encyclopedia as a supplement to course work undertaken at a school or university. That institution is not only located at a specific geographical juncture, but its location is probably essential for understanding many of its key attributes: the level of funding may vary according to the state or region where the university is located, or the same academic major might require different courses and readings at a university in China, for example, than in Argentina or Norway. Globalization refers to those processes whereby geographically distant events and decisions impact to a growing degree on "local" university life. For example, the insistence by powerful political leaders in the First World that the International Monetary Fund (IMF) should require that Latin and South American countries commit themselves to a particular set of economic policies might result in poorly paid teachers and researchers as well as large, understaffed lecture classes in San Paolo or Lima; the latest innovations in information technology from a computer research laboratory in India could quickly change the classroom experience of students in British Columbia or Tokyo. Globalization refers "to processes of change which underpin a transformation in the organization of human affairs by linking together and expanding human activity across regions and continents" (Held, McGrew, Goldblatt, Perraton, 1999: 15). Globalization in this sense is a matter of degree since any given social activity might influence events more or less faraway: even though a growing number of activities seems intermeshed with events in distant continents, certain human activities remain primarily local or regional in scope. Also, the magnitude and impact of the activity might vary: geographically removed events could have a relatively minimal or a far more extensive influence on events at a particular locality. Finally, we might consider the degree to which interconnectedness across frontiers is no longer merely haphazard but instead predictable and regularized (Held, McGrew, Goldblatt, Perraton, 1999).

Third, globalization must also include reference to the *speed* or *velocity* of social activity. Deterritorialization and interconnectedness initially seem chiefly spatial in nature. Yet it is easy to see how these spatial shifts are directly tied to the acceleration of crucial forms of social activity. As we observed above in our discussion of the conceptual forerunners to the present-day debate on globalization, the proliferation of high-speed transportation, communication, and information technologies constitutes the most immediate source for the blurring of geographical and territorial boundaries that prescient observers have diagnosed at least since the mid-nineteenth century. The compression of space presupposes rapid-fire forms of technology; shifts in our experiences of territory depend on concomitant changes in the temporality of human action. High-speed technology only represents the tip of the iceberg, however. The linking together and expanding of social activities across borders is predicated on the possibility of relatively fast flows and movements of people, information, capital, and goods. Without these fast flows, it is difficult to see how distant events could possibly posses the influence they now enjoy. High-speed technology plays a pivotal role in the velocity of human affairs. But many other factors contribute to the overall pace and speed of social activity. The

organizational structure of the modern capitalist factory offers one example; certain contemporary habits and inclinations, including the "mania for motion and speed" described by Dewey, represent another. Deterritorialization and the expansion of interconnectedness are intimately tied to the acceleration of social life, while social acceleration itself takes many different forms (Eriksen, 2001). Here as well, we can easily see why globalization is always a matter of degree. The velocity or speed of flows, movements, and interchanges across borders can vary no less than their magnitude, impact, or regularity.

Fourth, even though analysts disagree about the causal forces that generate globalization, most agree that globalization should be conceived as a relatively *long-term process*. The triad of deterritorialization, interconnectedness, and social acceleration hardly represents a sudden or recent event in contemporary social life. Globalization is a constitutive feature of the modern world, and modern history includes many examples of globalization (Giddens, 1990). As we saw above, nineteenth-century thinkers captured at least some of its core features; the compression of territoriality composed an important element of their lived experience. Nonetheless, some contemporary theorists believe that globalization has taken a particularly intense form in recent decades, as innovations in communication, transportation, and information technologies (for example, computerization) have generated stunning new possibilities for simultaneity and instantaneousness (Harvey, 1989). In this view, present-day intellectual interest in the problem of globalization can be linked directly to the emergence of new high-speed technologies that tend to minimize the significance of distance and heighten possibilities for deterritorialization and social interconnectedness. Although the intense sense of territorial compression experienced by so many of our contemporaries is surely reminiscent of the experiences of earlier generations, some contemporary writers nonetheless argue that it would be mistaken to obscure the countless ways in which ongoing transformations of the spatial and temporal contours of human experience are especially far-reaching. While our nineteenth-century predecessors understandably marveled at the railroad or the telegraph, a comparatively vast array of social activities is now being transformed by innovations that accelerate social activity and considerably deepen longstanding trends towards deterritorialization and social interconnectedness. To be sure, the impact of deterritorialization, social interconnectedness, and social acceleration are by no means universal or uniform: migrant workers engaging in traditional forms of low-wage agricultural labor in the fields of southern California, for example, probably operate in a different spatial and temporal context than the Internet entrepreneurs of San Francisco or Seattle. Distinct assumptions about space and time often coexist uneasily during a specific historical juncture (Gurvitch, 1964). Nonetheless, the impact of recent technological innovations is profound, and even those who do not have a job directly affected by the new technology are shaped by it in innumerable ways as citizens and consumers (Eriksen, 2001: 16).

Fifth, globalization should be understood as a *multi-pronged* process, since deterritorialization, social interconnectedness, and acceleration manifest themselves in many different (economic, political, and cultural) arenas of social activity. Although each facet of globalization is linked to the core components of globalization described above, each consists of a complex and relatively autonomous series of empirical developments, requiring careful examination in order to disclose the causal mechanisms specific to it (Held, McGrew, Goldblatt, Perraton, 1999). Each manifestation of globalization also generates distinct conflicts and dislocations. For example, there is substantial empirical evidence that cross-border flows and exchanges, as well as the emergence of directly transnational forms of production

by means of which a single commodity is manufactured simultaneously in distant corners of the globe, are gaining in prominence (Castells, 1996). High-speed technologies and organizational approaches are employed by transnationally operating firms, the so-called “global players,” with great effectiveness. The emergence of “around-the-world, around-the-clock” financial markets, where major cross-border financial transactions are made in cyberspace at the blink of an eye, represents a familiar example of the economic face of globalization. Global financial markets also challenge traditional attempts by liberal democratic nation-states to rein in the activities of bankers, spawning understandable anxieties about the growing power and influence of financial markets over democratically elected representative institutions. In political life, globalization takes a distinct form, though the general trends towards deterritorialization, interconnectedness across borders, and the acceleration of social activity are fundamental here as well. Transnational movements, in which activists employ rapid-fire communication technologies to join forces across borders in combating ills that seem correspondingly transnational in scope (for example, the depletion of the ozone layer), offer an example of political globalization. Another would be the tendency towards ambitious supranational forms of social and economic lawmaking and regulation, where individual nation-states cooperate to pursue regulation whose jurisdiction transcends national borders no less than the cross-border economic processes that may undermine traditional modes of nation state-based regulation. Political scientists typically describe the trend towards ambitious forms of supranational organization (the European Union, for example, or North America Free Trade Association) as important recent manifestations of political globalization. The proliferation of supranational organizations has been no less conflict-laden than economic globalization, however. Critics insist that local, regional, and national forms of self-government are being rapidly supplanted by insufficiently democratic forms of global governance remote from the needs of ordinary citizens, whereas their defenders describe new forms of supranational legal and political decision as indispensable forerunners to more inclusive and advanced forms of self-government.

3. The Normative Challenges of Globalization

The wide-ranging impact of globalization on human existence means that it necessarily touches on many basic philosophical questions. At a minimum, globalization suggests that academic philosophers in the rich countries of the West should pay closer attention to the neglected voices and intellectual traditions of peoples with whom our fate is intertwined in ever more intimate ways (Dallmayr, 1998). In this section, however, we focus exclusively on the immediate challenges posed by globalization to normative political theory.

Western political theory has traditionally presupposed the existence of territorially bound communities, whose borders can be more or less neatly delineated from those of other communities. The contemporary liberal political philosopher John Rawls continues to speak of bounded communities whose fundamental structure consists of “self-sufficient schemes of cooperation for all the essential purposes of human life” (Rawls, 1993: 301). Although political and legal thinkers historically have exerted substantial energy in formulating defensible normative models of relations between states (Nardin and Mapel, 1992), they typically have relied on a clear delineation of “domestic” from “foreign” affairs. In addition, they have often argued that the domestic arena represents a normatively privileged site, since fundamental

normative ideals and principles (for example, liberty or justice) are more likely to be successfully realized in the domestic arena than in relations among states. According to one influential strand within international relations theory, relations between states are fundamentally lawless. Since the achievement of justice or democracy, for example, presupposes an effective political sovereign, the lacuna of sovereignty at the global level means that justice and democracy are necessarily incomplete and probably unattainable there. In this “Realist” view of international politics, core features of the modern system of sovereign states relegate the pursuit of western political thought's most noble normative goals primarily to the domestic arena (Morgenthau, 1954).

Globalization poses a fundamental challenge to each of these traditional assumptions. It is no longer self-evident that nation-states can be described as “self-sufficient schemes of cooperation for all the essential purposes of human life” in the context of intense deterritorialization and the spread and intensification of social relations across borders. The idea of a bounded community seems suspect given recent shifts in the spatio-temporal contours of human life. Even the most powerful and privileged political units are now subject to increasingly deterritorialized activities (for example, global financial markets) over which they have limited control, and they find themselves nested in webs of social relations whose scope explodes the confines of national borders. Of course, in much of human history social relations have transcended existing political divides. However, globalization implies a profound quantitative increase in and intensification of social relations of this type. While attempts to offer a clear delineation of the “domestic” from the “foreign” probably made sense at an earlier juncture in history, this distinction no longer accords with core developmental trends in many arenas of social activity. As the possibility of a clear division between domestic and foreign affairs dissipates, the traditional tendency to picture the domestic arena as a privileged site for the realization of normative ideals and principles becomes problematic as well. As an empirical matter, the decay of the domestic-foreign frontier seems highly ambivalent, since it might easily pave the way for the decay of the more attractive attributes of domestic political life: as “foreign” affairs collapse inward onto “domestic” political life, the relative lawlessness of the former potentially makes disturbing inroads onto the latter (Scheuerman, 1999). As a normative matter, however, the disintegration of the domestic-foreign divide probably calls for us to consider, to a greater extent than ever before, how our fundamental normative commitments about political life can be effectively achieved on a global scale. If we take the principles of justice or democracy seriously, for example, it is no longer self-evident that the domestic arena is the main site for their pursuit, since domestic and foreign affairs are now deeply and irrevocably intermeshed. In a globalizing world, the lack of democracy or justice in the global setting necessarily impacts deeply on the pursuit of justice or democracy at home. Indeed, it may no longer be possible to achieve our normative ideals at home without undertaking to do so transnationally as well.

To claim, for example, that questions of distributive justice have no standing in the making of foreign affairs represents at best empirical naivete about economic globalization. At worst, it constitutes a disingenuous refusal to grapple with the fact that the material existence of those fortunate enough to live in the rich countries is inextricably tied to the material status of the vast majority of humanity residing in poor and underdeveloped regions. Growing material inequality spawned by economic globalization is linked to growing domestic material inequality in the rich democracies (Falk, 1999). Similarly, in the context of the ongoing destruction of the ozone layer by privileged countries like Australia, Japan, and

the United States, a dogmatic insistence on the sanctity of national sovereignty risks constituting a cynical fig leaf for irresponsible activities whose impact extends well beyond the borders of the polluting countries. Ozone-depletion cries out for ambitious forms of transnational cooperation and regulation, and the refusal by the rich democracies to accept this necessity implies a failure to take the process of globalization seriously when doing so conflicts with their material interests. Although it might initially seem to be illustrative of clever *Realpolitik* on the part of the polluting nations to ward off strict cross-border environmental regulation, their stubbornness is probably short-sighted: ozone depletion will affect the children of Americans who drive gas-guzzling SUVs or use environmentally unsound air-conditioning as well as the future generations of South Africa or Afghanistan. If we keep in mind that environmental degradation probably impacts negatively on democratic politics (for example, by undermining its legitimacy and stability), the failure to pursue effective transnational environmental regulation potentially undermines democracy at home as well as abroad.

In recent years, philosophers and political theorists have been busy addressing the normative implications of our globalizing world. A lively debate about the possibility of achieving justice at the global level now pits representatives of cosmopolitanism against communitarianism. Cosmopolitans underscore our universal moral obligations to those who reside faraway and with whom we share little in the way of language, custom, or culture, arguing that claims to “justice at home” can and should be applied elsewhere as well. In this way, cosmopolitanism builds directly on the universalistic impulses of modern moral and political thought. In contrast, communitarians dispute the view that our moral obligations to foreigners possess the same status as those to members of particular communities (for example, the nation-state) of which we remain very much a part. Communitarians by no means deny the need to redress global inequality, for example, but they often express skepticism in the face of cosmopolitanism's tendency to defend significant legal and political reforms as necessary to address the inequities of a planet where eighteen million people a year die of starvation (Jones, 1999; Pogge, 2001: 9). Nor do communitarians necessarily deny that the process of globalization is real, though some of them believe its impact has been grossly exaggerated (Kymlicka, 1999). Nonetheless, they doubt that humanity has achieved a rich or sufficiently articulated sense of a common fate such that far-reaching attempts to achieve greater global justice (for example, substantial redistribution from the rich to poor) could prove successful. Cosmopolitans not only typically counter with a flurry of universalist and egalitarian moral arguments, but they also accuse communitarians of obscuring the threat posed by globalization to the particular forms of community whose ethical primacy the communitarians endorse. From the cosmopolitan perspective, the communitarian tendency to favor moral obligations to fellow members of the nation-state represents a misguided and increasingly reactionary nostalgia for a rapidly decaying constellation of political practices and institutions.

A similar intellectual divide characterizes the ongoing debate about the prospects of democratic institutions at the global level. In a cosmopolitan mode, David Held (1995) argues that globalization requires the extension of liberal democratic institutions (including the rule of law and elected representative institutions) to the transnational level. Nation state-based liberal democracy is poorly equipped to deal with deleterious side effects of present-day globalization such as ozone depletion or burgeoning material inequality. In addition, a growing array of genuinely transnational forms of activity calls out for no less intrinsically transnational modes of liberal democratic decision-making. According

to this model, “local” or “national” matters should remain under the auspices of existing liberal democratic institutions. But in those areas where deterritorialization and social interconnectedness across national borders are especially striking, new transnational institutions (for example, cross-border referenda), along with a dramatic strengthening and further democratization of existing forms of supranational authority (in particular, the United Nations), are necessary if we are to assure that popular sovereignty remains an effective principle. In the same spirit, Jürgen Habermas has tried to formulate a defense of the European Union that conceives of it as a key steppingstone towards supranational democracy. If the EU is to help succeed in salvaging the principle of popular sovereignty in a world where the decay of nation state-based democracy makes democracy vulnerable, the EU will need to strengthen its elected representative organs and better guarantee the civil, political, and social and economic rights of all Europeans (Habermas, 2001: 58-113).

In opposition to Held, Habermas, and other defenders of global democracy, communitarian-minded skeptics underscore the purportedly utopian character of such proposals, arguing that democratic politics presupposes deep feelings of trust, commitment, and belonging that remain uncommon at the transnational level. Largely non-voluntary commonalities of belief, history, and custom compose necessary preconditions of any viable democracy, and since these commonalities are missing beyond the sphere of the nation-state, global or cosmopolitan democracy is doomed to fail (Archibugi, Held, and Koehler, 1998). In an analogous vein, critics inspired by Realist theory argue that cosmopolitanism obscures the fundamentally pluralistic, dynamic, and conflictual nature of political life on our divided planet. Notwithstanding its pacific self-understanding, cosmopolitan democracy inadvertently opens the door to new and even more horrible forms of political violence. Cosmpolitanism's universalistic moral discourse not only ignores the harsh and unavoidably agonistic character of political life, but it also tends to serve as a convenient ideological cloak for terrible wars waged by political blocs no less self-interested than the traditional nation state. For these critics, the fact that the recent Allied war against Iraq, conducted as a so-called “humanitarian intervention” with the blessings of the United Nations, probably resulted in at least 220,000 civilian deaths, vividly underscores the profound dangers intrinsic to the quest for novel forms of global democracy (Zolo 1997, 24).

Diagrams

All of us engage in and make use of valid reasoning, but the reasoning we actually perform differs in various ways from the inferences studied by most (formal) logicians. Actual reasoning as performed by human beings typically involves information obtained through more than one medium. Formal logic, by contrast, has thus far been primarily concerned with valid reasoning which is based on information in one form only, i.e. in the form of sentences. Recently, many philosophers, psychologists, logicians, mathematicians, and computer scientists have been increasingly aware of the importance of multi-modal reasoning and, moreover, much research has been undertaken in the area of non-symbolic, especially diagrammatic, representation systems. This entry outlines the overall directions of this new research area and focuses on the logical status of diagrams in proofs, their representational function and adequacy, different kinds of diagrammatic systems, and the role of diagrams in human cognition.

1. Introduction

Diagrams or pictures probably rank among the oldest forms of human communication. They are not only used for representation but can also be used to carry out certain types of reasoning, and hence play a particular role in logic. However, sentential representation systems (e.g., first-order logic) have been dominant in the modern history of logic, while diagrams have largely been seen as only of marginal interest. Diagrams are usually adopted as a heuristic tool in exploring a proof, but not as part of a proof. It is a quite recent movement among philosophers, logicians, cognitive scientists and computer scientists to focus on different types of representation systems, and much research has been focussed on diagrammatic representation systems.

Challenging a long-standing prejudice against diagrammatic representation, those working on multi-modal

reasoning have taken different kinds of approaches which we may categorize into three distinct groups. One branch of research can be found in philosophy of mind and cognitive science. Since the limits of linguistic forms are clear to those who have been working on mental representation and reasoning, some philosophers and cognitive scientists have embraced this new direction of multi-modal reasoning with enthusiasm and have explored human reasoning and mental representation involving non-linguistic forms [Cummins 1996, Chandrasekaran *et al*. 1995]. Another strand of work on diagrammatic reasoning shows that there is no intrinsic difference between symbolic and diagrammatic systems as far as their logical status goes. Some logicians have presented case studies to prove that diagrammatic systems can be sound and complete in the same sense as a symbolic system. This type of result directly refuted a widely-held assumption that diagrams are inherently misleading, and abolished theoretical objections to diagrams being used in proofs [Shin 1994, Hammer 1995]. A third direction in multi-modal reasoning has been taken by computer scientists, whose interest is much more practical than those of the other groups. Not so surprisingly, those working in many areas in computer science - for example, knowledge representation, systems design, visual programming, GUI design, and so on - found new and exciting opportunities in this new concept of 'heterogeneous system' and have implemented diagrammatic representations in their research areas.

We have the following goals for this entry. First of all, we would like to acquaint the reader with some details of specific diagrammatic systems. At the same time, the entry will address theoretical issues involved in the topic, by exploring the nature of diagrammatic representation and reasoning in terms of expressive power and correctness. The case study presented below will not only satisfy our first goal but also provide us with solid material for the more theoretical and general discussion in the third section. As mentioned above, the topic of diagrams has attracted much attention with important results from many different research areas. Hence, our fourth section aims to introduce various approaches to diagrammatic research taken in different areas.

For further discussions, we need to clarify two related but distinct uses of the word 'diagram': diagram as internal mental representations and diagram as external representation. The following quotation from Chandrasekaran *et al*. [1995, p. xvii] succinctly sums up the distinction between internal versus external diagrammatic representations:

- *External diagrammatic representations*: These are constructed by the agent in a medium in the external world (paper, etc), but are meant as representations by the agent.
- *Internal diagrams or images*: These comprise the (controversial) internal representations that are posited to have some pictorial properties.

As we will see below, logicians focus on external diagrammatic systems, the imagery debate among philosophers of mind and cognitive scientists is mainly about internal diagrams, and research on the cognitive role of diagrams touches on both forms.

2. Diagrams as Representational Systems

The dominance of sentential representation systems in the history of modern logic has obscured several important facts about diagrammatic systems. One of them is that several well-known diagrammatic systems

were available as a heuristic tool before the era of modern logic. Euler circles, Venn diagrams, and Lewis Carroll's squares have been widely used for certain types of syllogistic reasoning [Euler 1768, Venn 1881, Carroll 1896]. Another interesting, but neglected, story is that a founder of modern symbolic logic, Charles Peirce, not only revised Venn diagrams but also invented a graphical system, Existential Graphs, which has been proven to be equivalent to a predicate language [Peirce 1933, Roberts 1973, Zeman 1964].

These existing diagrams have inspired those researchers who have recently drawn our attention to multi-modal representation. Logicians who participate in the project have explored the subject in two distinct ways. First, their interest has focused exclusively on externally-drawn representation systems, as opposed to internal mental representations. Second, their aim has been to establish the logical status of a system, rather than to explain its heuristic power, by testing the correctness and the expressive power of selective representation systems. If a system fails to justify its soundness or if its expressive power is too limited, a logician's interest in that language will fade.

In this section, we examine the historical development of Euler and Venn diagrams as a case study to illustrate the following aspects: First, this process will show us how one mathematician's simple intuition about diagramming syllogistic reasoning has gradually been developed into a formal representation system. Second, we will observe different emphases given to different stages of extension and modification of a diagrammatic system. Thirdly and relatedly, this historical development illustrates an interesting tension and trade-off between the expressive power and visual clarity of diagrammatic systems. Most importantly, the reader will witness logicians tackle the issue of whether there is any intrinsic reason that sentential systems, but not diagrammatic systems, could provide us with rigorous proofs, and their success in answering this question in the negative.

Hence, the reader will not be surprised by the following conclusion drawn by Barwise and Etchemendy, the first logicians to launch an inquiry into diagrammatic proofs in logic,

> there is no principled distinction between inference formalisms that use text and those that use diagrams. One can have rigorous, logically sound (and complete) formal systems based on diagrams. (Barwise & Etchemendy [1995], p. 214.)

This conviction was necessary for the birth of their innovative computer program *Hyperproof*, which adopts both first-order languages and diagrams (in a *multi-modal* system) to teach elementary logic courses [Barwise & Etchemendy 1994].

2.1 Euler Diagrams

Leonhard Euler, an 18th century mathematician, adopted closed curves to illustrate syllogistic reasoning [Euler 1768]. The four kinds of categorical sentences are represented by him as shown in Figure 1.

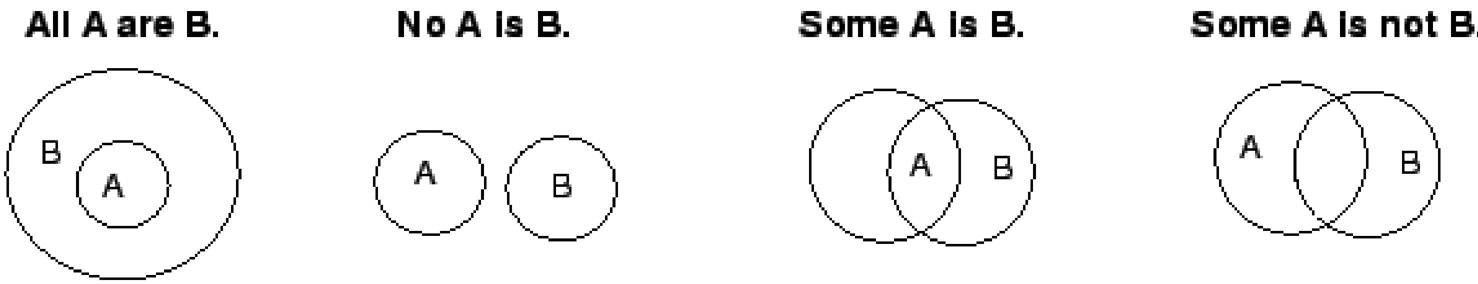

Figure 1: Euler Diagrams

For the two universal statements, the system adopts spatial relations among circles in an intuitive way: If the circle labelled 'A' is *included* in the circle labelled 'B,' then the diagram represents the information that all A is B. If there is *no overlapping* part between two circles, then the diagram conveys the information that no A is B.

This representation is governed by the following convention:[1]

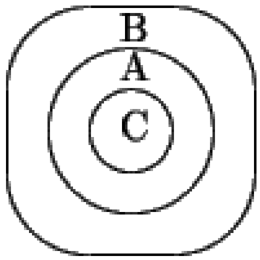
> Every object *x* in the domain is assigned a unique location, say *l*(*x*), in the plane such that *l*(*x*) is *in* region *R* if and only if *x* is a member of the set that the region *R* represents.

The power of this representation lies in the fact that an object being a member of a set is easily conceptualized as the object falling inside the set, just as locations on the page are thought of as falling inside or outside drawn circles. The system's power also lies in the fact that no additional conventions are needed to establish the meanings of diagrams involving more than one circle: relationships holding among sets are asserted by means of the same relationships holding among the circles representing them. The representations of the two universal statements, "All A are B" and "No A is B," illustrate this strength of the system.

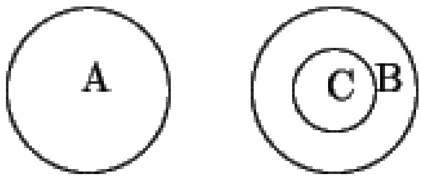
Moving on to two existential statements, this clarity is not preserved. Euler justifies the diagram of "Some A is B" saying that we can infer *visually* that something in A is also contained in B since part of area A is contained in area B.[2] Obviously, Euler himself believed that the same kind of visual containment relation among areas can be used in this case as well as in the case of universal statements. However, Euler's belief is not correct and this representation raises a damaging ambiguity. In this diagram, not only is part of circle A contained in area B (as Euler describes), but the following are true: (i) part of circle B is contained in area A (ii) part of circle A is not contained in circle B (iii) part of circle B is not contained in circle A. That is, the third diagram could be read off as "Some B is A," "Some A is not B," and "Some B is not A" as well as "Some A is B." In order to avoid this ambiguity, we need to set up several more conventions.[3]

Euler's own examples nicely illustrate the strengths and weaknesses of his diagrammatic system.

> **Example 1**. All A are B. All C are A. Therefore, all C are B.



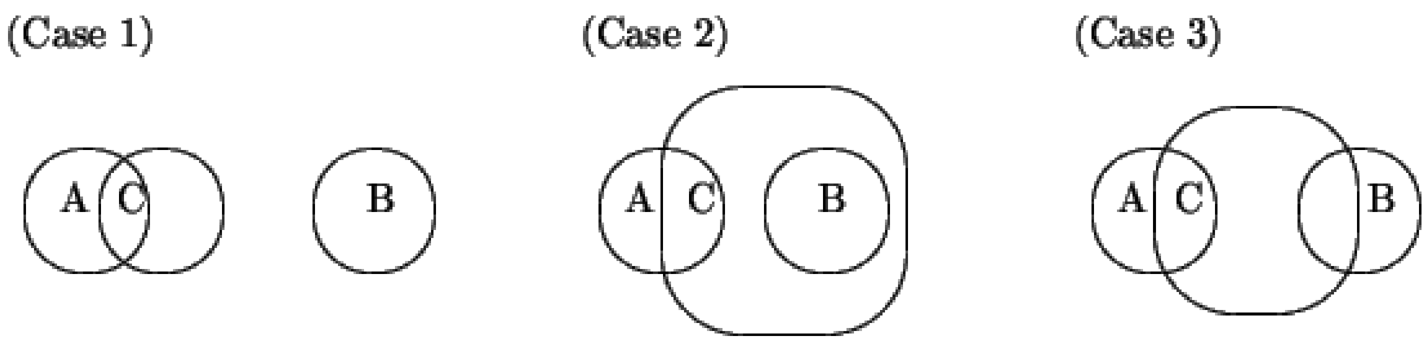
Example 2. No A is B. All C are B. Therefore, no C is A.



In both examples, the reader can easily infer the conclusion, and this illustrates visually powerful features of Euler diagrams. However, when existential statements are represented, things become more complicated, as explained above. For instance:

Example 3. No A is B. Some C is A. Therefore, Some C is not B.

No single diagram can represent the two premises, since the relationship between sets B and C cannot be fully specified in one single diagram. Instead, Euler suggests the following three possible cases:



Euler claims that the proposition ‘Some C is not B’ can be read off from all these diagrams. However, it is far from being visually clear how the first two cases lead a user to reading off this proposition, since a user might read off “No C is B” from case 1 and “All B is C” from case 2.

Hence, the representation of existential statements not only obscures the visual clarity of Euler Circles but also raises serious interpretational problems for the system. Euler himself seemed to recognize this potential problem and introduced a new syntactic device, ‘*’ (representing non-emptiness) as an attempt to repair this flaw. (Letter 105)

However, a more serious drawback is found when this system fails to represent certain compatible (that is, consistent) pieces of information in a single diagram. For example, Euler's system prevents us from drawing a single diagram representing the following pairs of statements: (i) “All A are B” and “No A is B” (which are

consistent if A is an empty set). (ii) “All A are B” and “All B are A” (which are consistent when A = B). (iii) “Some A is B” and “All A are B”. (Suppose we drew an Euler diagram for the former proposition and try to add a new compatible piece of information, i.e., the latter, to this existing diagram.) This shortcoming is closely related to Venn's motivation for his own diagrammatic system (see Section 3.1 for other shortcomings of Euler's system).

2.2 Venn Diagrams

Venn's criticism of Euler Circles is summarized in the following passage:

> The weak point in this [Euler diagrams], and in all similar schemes, consists in the fact that they only illustrate in strictness the actual relation of classes to each other, rather than the imperfect knowledge of these relations which we may possess, or may wish to convey by means of the proposition. [Venn 1881, p. 510.]

Because of its strictness, Euler's system sometimes fails in representing consistent pieces of information in a single diagram, as shown above. In addition to this expressive limitation, Euler's system also suffers other kinds of expressive limitations with respect to non-empty sets, due to topological restrictions on plane figures (see Section 3.1).

Venn's new system [1881] was to overcome these expressive limitations so that partial information can be represented. The solution was his idea of ‘primary diagrams’. A primary diagram represents all the possible set-theoretic relations between a number of sets, without making any existential commitments about them. For example, Figure 2 shows the primary diagram about sets A and B.

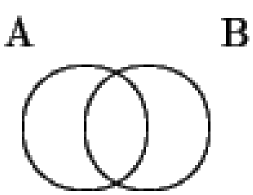


Figure 2: Venn's Primary diagrams

According to Venn's system, this diagram does not convey any specific information about the relation between these two sets. This is the major difference between Euler and Venn diagrams.

For the representation of universal statements, unlike the visually clear spatial containment relations in the case of Euler diagrams, Venn's solution is ‘to shade them [the appropriate areas] out’ ([Venn 1881], p. 122). By using this syntactic device, we obtain diagrams for universal statements as shown in Figure 3.

Figure 3: Venn's shading

Venn's choice of shading might not be absolutely arbitrary in that a shading could be interpreted as a

visualization of set emptiness. However, it should be noted that a shading is a new syntactic device which Euler did not use. This revision gave flexibility to the system so that certain compatible pieces of information may be represented in a single diagram. In the following, the diagram on the left combines two pieces of information, “All A are B” and “No A is B,” to visually convey the information “Nothing is A.” The diagram below, representing both “All A are B” and “All B are A,” clearly shows that A is the same as B:

In fact, using primary diagrams also avoids some other expressivity problems (to do with spatial properties of diagram objects) discussed below, in Section 3. Surprisingly, Venn was silent about the representation of existential statements, which was another difficulty of Euler diagrams. We can only imagine that Venn might have introduced another kind of a syntactic object representing existential commitment. This is what Charles Peirce did about twenty years later.

2.3 Peirce's extension

Peirce points out that Venn's system has no way of representing the following kinds of information: existential statements, disjunctive information, probabilities, and relations. Peirce aimed to extend Venn's system in expressive power with respect to the first two kinds of propositions, i.e., existential and disjunctive statements. This extension was completed by means of the following three devices. (i) Replace Venn's shading representing emptiness with a new symbol, ‘o’. (ii) Introduce a symbol ‘x’ for existential import. (iii) For disjunctive information, introduce a linear symbol ‘-’ which connects ‘o’ and ‘x’ symbols.

For example, Figure 4 represents the statement, ‘All A are B or some A is B’, which neither Euler's nor Venn's system can represent in a single diagram.

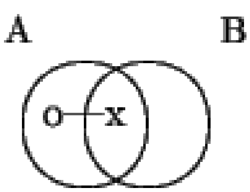

Figure 4: A Peirce diagram

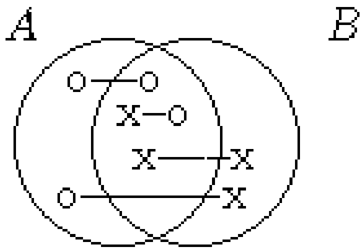
The reason that Peirce replaced Venn's shading for emptiness with the symbol ‘o’ seems to be obvious: It would not be easy to connect shadings or shadings and x's in order to represent disjunctive information. In this way, Peirce increased the expressive power of the system, but this change was not without its costs.

For example, the following diagram represents the proposition ‘ *Either* all A are B and some A is B, *or* no A is B and some B is not A’:



Reading off this diagram requires more than reading off visual containment among circles (as in Euler diagrams) or shadings (as in Venn diagrams), but also requires extra conventions for reading combinations of the symbols ‘o,’ ‘x,’ and lines. Peirce's new conventions increased the expressive power of single diagrams, but the arbitrariness of its conventions and more confusing representations (for example, the above diagram) sacrificed the visual clarity which Euler's original system enjoys. At this point, Peirce himself confesses that ‘there is a great complexity in the expression that is essential to the meaning’ ([Peirce 1933], 4.365). Thus, when Peirce's revision was completed, most of Euler's original ideas about visualization were lost, except that a geometrical object (the circle) is used to represent (possibly empty) sets.

Another important contribution Peirce made to the study of diagrams starts with the following remark:

> ‘Rule’ is here used in the sense in which we speak of the ‘rules’ of algebra; that is, as a permission under strictly defined conditions. ([Peirce 1933], 4.361.)

Peirce was probably the first person to discuss rules of transformation in a non-sentential representation system. In the same way that the rules of algebra tell us which transformations of symbols are permitted and which are not, so should the rules of diagram manipulation. Some of Pierce's six rules needed more clarification and turn out to be incomplete - a problem which Peirce himself anticipated. However, more importantly, Peirce did not have any theoretical tool - a clear distinction between syntax and semantics - to convince the reader that each rule is correct or to determine whether more rules are needed. That is, his important intuition (that there could be transformation rules for diagrams) remained to be justified.

2.4 Diagrams as formal system

In [1994], Shin follows up Peirce's work in two directions. One is to improve Peirce's version of Venn diagrams, and the other is to prove the soundness and the completeness of this revised system.

Shin's work alters Peirce's modifications of Venn diagrams to achieve an increase in expressive power without such a severe loss of visual clarity. This revision is made in two stages: (i) Venn-I: retains Venn's shadings (for emptiness), Peirce's ‘*x*’ (for existential import) and Peirce's connecting line between *x*'s (for disjunctive information). (ii) Venn-II: This system, which is proven to be logically equivalent to monadic predicate logic, is the same as Venn-I except that a connecting line between diagrams is newly introduced to display disjunctive information.

Returning to one of Euler's examples we will see the contrast among these different versions clearly:

Example 3. No A is B. Some C is A. Therefore, Some C is not B.

Euler admits that no single Euler diagram can be drawn to represent the premises, but that three possible cases must be drawn. Venn's system is silent about existential statements. Now, Peirce's and Shin's systems represent these two premises in a single diagram as follows:

In the case of Shin's diagram, Venn's shading convention for emptiness, as opposed to Peirce's ‘o’, much more naturally leads the reader to the inference “Some C is not B” than in the case of Peirce's diagram.

However, Venn-I cannot express disjunctive information between universal statements or between universal and existential statements. Retaining Venn-I's expressive power, Venn-II allows diagrams to be connected by a line. Peirce's confusing looking diagram above is equivalent to the following Venn-II diagram:

In addition to this revision, Shin [1994] presented each of these two systems as a standard formal representation system equipped with its own syntax and semantics. The syntax tells us which diagrams are acceptable, that is, which are well-formed, and which manipulations are permissible in each system. The semantics defines logical consequences among diagrams. Using these tools, it is proven that the systems are sound and complete, in the same sense that some symbolic logics are.

This approach has posed a fundamental challenge to some of the assumptions held about representation systems. Since the development of modern logic, important concepts, e.g., syntax, semantics, inference, logical consequence, validity, and completeness, have been applied to sentential representation systems only. However, none of these turned out to be intrinsic to these traditional symbolic logics only. For *any* representation system, whether it is sentential or diagrammatic, we can discuss two levels, a syntactic and a semantic level. What inference rules tell us is how to manipulate a given unit, whether symbolic or diagrammatic, to another. The definition of logical consequence is also free from any specific form of a representation system. The same argument goes for the soundness and the completeness proofs. When a system is proven to be sound, we should be able to adopt it in proofs. In fact, much current research explores the use of diagrams in automated theorem proving (see Section 4 and [Barker-Plummer & Bailin 1997, Jamnik *et al*. 1999]).

2.5 Euler Circles revisited

It is interesting and important to notice that the gradual changes made from Euler Circles through to Shin's systems share one common theme: to increase both the expressive and logical power of the system so that it is sound, complete, and logically equivalent to monadic predicate logic. The main revision from Euler to Venn diagrams, introducing primary diagrams, allows us to represent partial knowledge about relations between sets. The extension from Venn to Peirce diagrams is made so that existential and disjunctive

information may be represented more effectively.

Both Venn and Peirce adopted the same kind of solution in order to achieve these improvements: to introduce new syntactic objects, that is, shadings by Venn, and x's, o's, and lines by Peirce. However, on the negative side, these revised systems suffer from a loss of visual clarity, as seen above, mainly because of the introduction of more arbitrary conventions. The modifications from Peirce to Shin diagrams concentrate on restoring visual clarity, but without loss of expressive power.

Hammer and Shin take a different path from these revisions: To revive Euler's homomorphic relation between circles and sets -- containment among circles represents the subset relation among sets, and non-overlapping of regions represents the disjoint relation -- and at the same time, to adopt Venn's primary diagrams by default. On the other hand, this revised Euler system is not a self-sufficient tool for syllogistic reasoning, since it cannot represent existential statements. For more details of this revised system, refer to [Hammer & Shin 1998].

This case study raises an interesting question for further research on diagrammatic reasoning. Throughout the different developments of Euler diagrams, increasing its expressive power and enhancing its visual clarity seem to be complementary to each other. Depending on purposes, we need to give priority to one over the other. Hammer and Shin's alternative system provides a simple model for the development of other efficient non-sentential representational systems, a topic that has been receiving increasing attention in computer science and cognitive science.

3. Consequences of Spatial Properties of Diagrams

While it is often possible to afford diagrams the same logical status as formulae (as argued above), there are still important differences (which can have ramifications for correctness of the system) between diagrams and traditional linear proof calculi. An important point to note about diagrams (as Russell did [1923]) is that spatial relations between objects in a diagram can be used to represent relations between objects in some other domain. Sequential languages (e.g., symbolic logics, natural languages), however, use only the relation of concatenation to represent relations between objects. The peculiar representational use of spatial relations in the case of diagrams is direct and intuitive, as seen in the development of Euler Diagrams above, but also has its perils - as we shall discuss. Spatial constraints, being peculiar to diagrammatic systems, can be expected to be an important source of both their strengths and weaknesses. Psychological considerations concerning human capacities for visual processing of information, and skill at qualitative spatial reasoning, also have ramifications for the effectiveness of reasoning with diagrams, but we shall not survey them here.

A particular distinguishing feature of diagrams is that they obey certain “nomic” or “intrinsic” constraints due to their use of plane surfaces as a medium of representation. The idea is that sentential languages are based on acoustic signals which are sequential in nature, and so must have a compensatingly complex syntax in order to express certain relationships - whereas diagrams, being two-dimensional, are able to display some relationships without the intervention of a complex syntax [Stenning & Lemon 2001]. Diagrams exploit this possibility - the use of spatial relations to represent other relations. The question is; how well can spatial relations and objects represent other (possibly more abstract) objects and relations?

Logical reasoning with diagrams is often carried out in virtue of their depiction of all possible models of a situation, up to topological equivalence of the diagrams (this, of course, depends on the particular diagrammatic system in use). A single diagram is often an abstraction over a class of situations, and once a suitable diagram has been constructed, inferences can simply be read-off the representation without any further manipulation. In some diagrammatic systems (e.g., Euler Circles) inference is carried out by constructing diagrams correctly and reading information off them. The complexity of using inference rules in a symbolic logic is, in these cases, replaced by the problem of drawing particular diagrams correctly.[4] For instance, an Euler Circles diagram ventures to capture relationships between sets using topological relationships between plane regions in such a way that that it depicts all the possible ways that a certain collection of set-theoretic statements could be true. This has two important consequences: (1) if a certain diagram cannot be drawn then the described situation must be impossible (termed "self-consistency"), and (2) if a certain relationship between diagram objects must be drawn, then the corresponding relation can be inferred as logically vaild. (See the numerous examples in Section 2.) This phenomenon is often termed a "free-ride" [Barwise & Shimojima 1995]. This style of diagrammatic reasoning is thus dependent on a particular representational use of diagrams - that they represent classes of models. If a particular class of models cannot be represented by a diagrammatic system, then those cases will not be taken into account in inferences using the system, and incorrect inferences might be drawn. This fact makes the representational adequacy of diagrammatic systems, restricted by their spatial nature, of paramount importance, as we shall now explore.

3.1 Limitations on diagrammatic representation and reasoning

The representational use of the spatial relations in the plane constrains diagrammatic representation, and therefore reasoning with diagrams, in certain important ways. In particular, there are topological and geometrical (let us lump them together as "spatial") properties of diagrammatic objects and relations which limit the expressive power of diagrammatic systems. For instance, in graph theory it is known that some simple structures cannot be drawn in the plane. For example, the graph G_5 is the graph consisting of 5 nodes, each joined to the other by an arc. This graph is non-planar, meaning that it cannot be drawn without at least two of the arcs crossing. This is just the sort of constraint on possible diagrams that limits the expressive power of diagrammatic systems. Now, since diagrammatic reasoning can occur by enumeration of all possible models of a situation, this representational inadequacy (a type of incompleteness) renders many diagrammatic systems incorrect if they are used for logical reasoning (e.g., see the critque of [Englebretsen 1992] in [Lemon & Pratt 1998]).

Perhaps the most simple example of this is due to Lemon and Pratt[5] (see e.g., [1997]). Consider Euler Circles -- where convex regions of the plane represent sets, and overlap of the regions represents non-empty intersection of the corresponding sets. A result of convex topology known as Helly's Theorem states (for the 2 dimensional case) that if every triple of 4 convex regions has a non-empty intersection then all four regions must have a non-empty intersection.

To understand the ramifications of this, consider the following problem:

Example 4. Using Euler Circles, represent the following premises:

$$A \cap B \cap C \neq \varnothing$$

$$B \cap C \cap D \neq \varnothing$$

$$C \cap D \cap A \neq \varnothing$$

Note that, in terms of set-theory, only trivial consequences follow from these premises. However, an Euler diagram of the premises, such as Figure 5, leads to the incorrect conclusion that $A \cap B \cap C \cap D \neq \varnothing$ (due to the quadruple overlap region in the centre of the diagram):

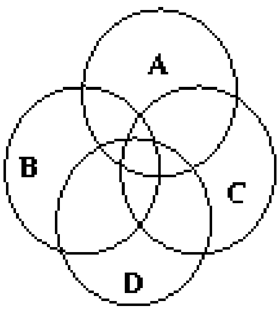


Figure 5: An Euler's Circles representation exhibiting Helly's Theorem

In other words, a user of Euler Circles is forced[6] to represent a relationship between the sets which is not logically necessary. This means both that there are logically possible situations which the system cannot represent, and that a user would make incorrect inferences if they relied on the system for reasoning. More generally, this type of result can be generated for many different types of diagrammatic system, depending on the particular spatial relations and objects which they use in representation - a research programme which is ongoing.

For example, using non-convex regions (e.g., “blobs” instead of circles) leads to a similar problem, only that non-planar graphs are involved instead of Helly's Theorem. A similar result concerns linear diagrams for syllogisms [Englebretsen 1992], where lines are used to represent sets, points represent individuals, point-line intersection represents set-membership, and intersection of lines represents set-intersection. Again, planarity constraints restrict the expressive power of the system and lead to incorrect inferences.

Atsushi Shimojima's “constraint hypothesis” perhaps best sums all this up:

> Representations are objects in the world, and as such they obey certain structural constraints that govern their possible formation. The variance in inferential potential of different modes of representation is largely attributable to different ways in which these structural constraints on representations match with the constraints on targets of representation ([Shimojima 1996a, 1999]).

3.2 Efficacy of diagrams

As discussed above, much of the interest in diagrams has been generated by the claim that they are somehow more “effective" than traditional logical representations for certain types of task. Certainly, for example, a map is a greater aid to navigation than a verbal description of a landscape. However, while there are certainly psychological advantages to be gained through the use of diagrams, they are (as in the case of Euler Circles) often ineffective as representations of abstract objects and relationships. Once a purely intuitive notion, non-psychological claims about “efficacy” of diagrammatic systems can be examined in terms of standard formal properties of languages [Lemon *et al*. 1999]. In particular, many diagrammatic systems are self-consistent, incorrect, and incomplete, and complexity of inference with the diagrams is NP-hard. By way of contrast, most sentential logics, while able to express inconsistencies, are complete and correct.

On the other hand, not being able to represent contradictions could provide us with interesting insights about the nature of diagrammatic representation. If a central goal of a language is to represent the world or a state of affairs, then representing contradictions or tautologies is called into question. Neither contradictions nor tautologies are part of the world. How can we draw a picture, or take a picture, of the contradiction that it is raining and it is not raining? How about the picture of it is either raining or not raining? Now, we seem to be much closer to Wittgenstein's classic picture theory of language [Wittgenstein 1921].

4. Diagrams and Cognition, Applications

Despite the formal limitations of some diagrammatic systems noted above, many different systems are currently used in a wide variety of contexts; logic teaching, automated reasoning, specifying computer programs, reasoning about situations in physics, graphical user interfaces to computer programs, and so on. In general, it is not yet known how effective (in the above sense) many of these diagrammatic systems are. We now give a brief survey of other diagrammatic systems and their uses, as well as the more philosophical issues raised by the debate over the status of diagrammatic reasoning.

4.1 Some other Diagrammatic Systems

It is worth noting that many mathematicians and philosophers proposed diagrammatic systems, often with a didactic motivation. Some systems, like Lewis Carroll's in “The Game of Logic" [1896] are variants on the proposals of Euler and Venn. Others, like Frege's [1879], used lines rather than plane regions. (For a description of Frege's notation, see the notation table in the entry Frege's logic, theorem and foundations for arithmetic. See also [Englebretsen 1992].) Carroll's system supercedes Venn's in that the complements of sets are explicitly represented as regions of the diagram, rather than being left as the background region against which the circles appear. This means that Carroll's system is able to draw inferences about relations between complements of properties, at the expense of representing some properties as disjoint (i.e., non-connected) regions. This shift closely mirrors the shift in logic from subject-predicate argumentation to a function-argument representation [Stenning 1999].

As a more practical side of the project, AI researchers, one of whose main concerns is the heuristic power of

a representation system in addition to its expressive power, have been debating for decades about different forms of representation [Sloman 1971, 1985, 1995]. Hence, they have welcomed discussions of the distinct role of visual reasoning and have recently hosted interdisciplinary symposiums on diagrammatic reasoning at AI conferences.[7] At the same time, realizing that human beings adopt different representation forms depending on the kinds of problems they face, some AI researchers and design theorists have practiced domain-specific approaches to bringing in problem-tailored representation forms.[8]

For instance, Harel [1988] invented highgraphs to represent system specifications in computer science. This idea has been taken up in industrial applications (e.g., UML [Booch *et al*. 1998]). Several authors have also worked on the problem of automating reasoning with diagrams in mathematical contexts. For instance, that the sum of the first n odd natural numbers is n squared is easily seen by decomposing an n x n grid into “ells” [Jamnik *et al*. 1999]. Getting computers to carry out this kind of analogical reasoning is also the task of [Barker-Plummer & Bailin 1997] amongst others.

It should also be mentioned that scientists such as chemists and physicists also use diagrams in order to perform certain computations. Feynman diagrams, for example, are used to perform calculations in sub-atomic physics. In Knot Theory (which has applications in physics [Kauffman 1991]) the three Reidemeister Moves are diagrammatic operations which make up a complete calculus for proving knots equivalent.

4.2 Diagrams as Mental Representations

Do our mental representations have diagram-like or picture-like entities as components? This question has a long history both in philosophy and in psychology, independently of each other. More recently, however, some philosophers have participated in this “imagery debate”, one of the most time-honored controversies in psychology, and some cognitive psychologists find certain epistemological theories in philosophy useful to support their views on the issue.

The nature of mental representation has been one of the perennial topics in philosophy, and we can easily trace back philosophical discussions on images and mental representation to ancient times.[9] The writings of Hobbes, Locke, Berkeley, and Hume concern themselves in large part with mental discourse, the meaning of words, mental images, particular ideas, abstract ideas, impressions, and so on. Descartes' well-known distinction between imagining and conceiving something has generated much discussion about the unique role of visual images in mental representations. The development of cognitive science in the 20th century naturally has brought certain group of philosophers and psychologists closer and we find a number of authors whose works easily belong to both disciplines [Block 1983, Dennett 1981, Fodor 1981].

Imagery based on mental inspection was the main focus in the early development of psychology until the behavioristic approach became predominant in the discipline. During the era of behaviorism, anything related to mental inspection, including images, was excluded from any serious research agenda. Finally when the topic of mental images made a comeback in psychology in 1960s, researchers adopted a more humble agenda for mental imagery than before: Not all mental representations involve imagery, and imagery is one of many ways of manipulating information in the mind. Also, thanks to the influence of behaviorism, it is

acknowledged that introspection is not enough to explore imagery, but a claim about mental imagery needs to be confirmable by experiments in order to show that we successfully externalize mental events. That is, if what a certain mental introspection tells us is genuine, then there would be observable external consequences of that mental state.

Thus the contemporary imagery debate among cognitive scientists is about the claim that picture-like images exist as mental representations and about how we interpret certain experiments.[10]

Kosslyn [1980, 1994] and other pictorialists [Shepard & Metzler 1971] present experimental data to support their position that some of our mental images are more like pictures than a linear form of language (for example, natural languages or artificial symbolic languages) in some important aspects, even though not all visual mental images and pictures are of exactly the same kind. By contrast, Pylyshyn [1981] and other descriptionalists [Dennett 1981] raise questions about the picture-like status of mental images and argue that mental images are formed out of structured descriptions. To them, mental images represent in the manner of language rather than pictures and, hence, there are no picture-like visual mental images.

Both sides of the debate sometimes used a philosophical theory as a supporting factor. For example, pictorialists in the imagery debate found the modern sense-datum theory in philosophy quite close to their point of view. By the same token, the critics of the sense-datum theory argued that the mistaken pictorial view of mental images arises mainly from our confusion about ordinary language and claimed that mental images are epiphenomena.

4.3 The Cognitive Role of Diagrams

Without being heavily involved in the imagery debate, some researchers have focused on a distinct role that diagrams or pictures - as opposed to traditional sentential forms - play in our cognitive activities. Based on the conjectures that humans adopt diagrammatic or spatial internal mental representations in their reasoning about concrete or abstract situations (see [Howell 1976, Sober 1976]), some cognitive scientists have concentrated on the functions of images or diagrams in our various cognitive activities, for example, memory, imagination, perception, navigation, inference, problem-solving, and so on. Here, the distinct nature of "visual information," which is obtained either through internal mental images or through externally drawn diagrams, has become a major topic of research. Even though most of these works assume that there are mental images (that is, they accept the pictorialists' claim), strictly speaking they do not have to commit themselves to the view that these images exist as basic units in our cognition. Descriptionalists do not have to discard discussions of the functions of images, but only need to add that these images are not primitive units stored in our memory, but formed out of structured descriptions more like the sentences of a language. (See [Pylyshyn 1981].)

A search for the distinct role of diagrams has led researchers to explore the differences among different forms of external or internal representations, and mainly between diagrammatic and sentential representations. Many important results have been produced in cognitive science. Starting from Larkin and Simon's classic case study [1987] to illustrate a difference between informational and computational equivalence among representation systems, Lindsay's work locates where this computational difference lies,

which he calls a 'non-deductive' method. As briefly pointed out above, this inference process is called 'free ride' by Barwise and Shimojiima [1995], i.e., the kind of an inference in which the conclusion seems to be read off automatically from the representation of premises. In Gurr, Lee, and Stenning [1998] and Stenning and Lemon [2001], there is an explanation of the uniqueness of diagrammatic inference in terms of a degree of 'directness' of interpretation, and it is argued that this property is relative, and hence that "some rides are cheaper than others". Having the role of graphs in mind, Wang and Lee ([1993]) present a formal framework as a guideline for correct visual languages. At this point, we are very close to applied aspects of research in multi-modal reasoning - design theory and AI research - by providing these disciplines with with computational support for visual reasoning.

Related to the issue of imagistic mental representation is the examination of the semantics of various diagrammatic systems and what they can teach us about the nature of languages in general (e.g., Goodman [1968]). For instance, Robert Cummins [1996], amongst others, argues that too much attention has been given to sentential representations and that focus on a notion of "structural representation" more akin to diagrammatic representation can help to explicate the nature of representation itself. We believe that the considerations presented above give us some empirical handle on this type of claim at least - depending on the imagistic objects and relations used, patterns of incorrect inference should be predictable and detectable. An important article, if little-known, article on this theme is [Malinas 1991]. Here Malinas explores the concepts of pictorial representation and "truth in" a picture via the notion of resemblance, and considers various semantic puzzles about pictorial representation. He develops Peacocke's "Central Thesis" of depiction ([Peacocke 1987]), where experienced similarities between properties of pictorial objects and their referents in the visual field give rise to the relation of depiction. He goes on to provide a formal semantics for pictures which is "analogous to a semantics for an ideal language".

Summary

We began by motivating the philosophical interest of diagrams, by way of their role in human reasoning and their relation to the study of language in general, and multi-modal information processing. We then explained the trade-off between expressive power and visual clarity of diagrammatic systems, by examining the historical development of diagram systems from Euler and Venn, through Peirce's work, to recent work by Shin and Hammer. It was argued that diagrammatic systems can be afforded the same logical status as traditional linear proof calculi. We then explained some of the potential pitfalls of diagrammatic representation and reasoning, by examining spatial constraints on diagrammatic systems and how they can affect correctness and expressive power. We closed by surveying other diagrams systems, the interest in diagrams generated in computer science and cognitive science, and gave an introduction to the imagery debate in the philosophy of mind.

Notes to Diagrams

Notes

1. Note that, however natural this convention may sound, this is still an arbitrary convention. For example, Lambert and Englebretsen's systems visualize individuals as points and sets as lines [Lambert 1764, Englebretsen 1992].

2. Euler [1768], p. 233.

3. For more details, see Hammer and Shin [1998].

4. Such problems have been studied under the banner of "Topological Inference" and are nearly all NP hard [Grigni *et al*. 1995, Lemon & Pratt 1997b].

5. Now Ian Pratt-Hartmann.

6. As a practical instance of Helly's Theorem.

7. For example: Reasoning with Diagrammatic Representations: 1992 AAAI Spring Symposium; Cognitive and Computational Models of Spatial Representation: 1996 AAAI Spring Symposium; Reasoning with Diagrammatic Representations II: 1997 AAAI Fall Symposium; and Formalizing Reasoning with Visual and Diagrammatic Representations: 1998 AAAI Fall Symposium. See also Narajanan [1993].

8. The following conferences are good evidence for this effort: VISUAL '98: Visualization Issues in Formal Methods (Lisbon); International Roundtable Conference on Visual and Spatial Reasoning in Design (MIT, 1999); and Theories of Visual Languages -- Track of VL '99 : 1999 IEEE Symposium on Visual Languages.

9. See Aristotle *On the Soul* and *On the Memory and Recollection*.

10. Block [1981] is one of the best collections of important papers on this debate, and Block [1983] presents a succinct summary of this controversy and raises insightful philosophical questions about the debate. Chapters 1-4 of Tye [1991] are a good overview of both cognitive scientists' and philosophers' various positions on this issue.

Peirce's Logic

Charles Peirce's contributions to logical theory are numerous and profound. His work on relations building on ideas of De Morgan influenced Schroder, and through Schroder Peano, Russell, Lowenheim and much of contemporary logical theory. Although Frege anticipated much of Peirce's work on relations and quantification theory, and to some extent developed it to a greater extent, Frege's work remained out of the mainstream until the twentieth century. Thus it is plausible that Peirce's influence on the development of logic has been of the same order as Frege's. Further discussion of Peirce's influence can be found in Dipert (1995).

In contrast to Frege's highly systematic and thoroughly developed work in logic, Peirce's work remains fragmentary and extensive, rich with profound ideas but most of them left in a rough and incomplete form. Three of the Peirce's contributions to logic that are not as well-known as others are described below:

Among Peirce's other contributions to logic are: (i) quantification theory (see Peirce (1885) and Berry (1952)), (ii) propositional logic (see Berry (1952)), (iii) Boolean algebra (see Lewis (1918)), and (iv) "Peirce's Remarkable Theorem" (see Herzberger (1981) and Berry (1952)).

Three-Valued Logic

In three unnumbered pages from his unpublished notes written before 1910, Peirce developed what amounts to a semantics for three-valued logic. This is at least ten years before Emil Post's dissertation, which is usually cited as the origin of three-valued logic. A good source of information about these three pages is Fisch and Turquette (1966), which also includes reproductions of the three pages from Peirce's

notes.

In his notes, Peirce experiments with three symbols representing truth values: V, L, and F. He associates V with "1" and "T", indicating truth. He associates F with "0" and "F", indicating falsehood. He associates L with "1/2" and "N", indicating perhaps an intermediate or unknown value.

Peirce defines a large number of unary and binary operators on these three truth values. The semantics for the operators is indicated by truth tables. Two examples are given here. First, the bar operator (indicated here by a minus sign) is defined as follows:

x	V	L	F
-x	F	L	V

Applied to truth the bar operator yields falsehood, applied to unknown it yields unknown and applied to falsehood it yields truth.

The Z operator is a binary operator which Peirce defines as follows:

	V	L	F
V	V	L	F
L	L	L	F
F	F	F	F

Thus, the Z operator applied to a falsehood and anything else yields a falsehood. The Z operator applied to an unknown and anything but a falsehood yields an unknown. And the Z operator applied to a truth and some other value yields the other value.

The bar operator and the Z operator provide the essentials of a truth-functionally complete strong Kleene semantics for three-valued logic. In addition to these two strong Kleene operators, Peirce defines several other forms of negation, conjunction, and disjunction. The notes also provide some basic properties of some of the operators, such as being symmetric and being associative.

Calculus of Relations

Building on ideas of De Morgan, Peirce fruitfully applied the concepts of Boolean algebra to relations. Boolean algebra is concerned with operations on general or class terms. Peirce applied the same idea to

what he called "relatives" or "relative terms." While his ideas evolved continually over time on this subject, fairly definitive presentations are found in Peirce (1870) and Peirce (1883). The calculus of relatives is developed further in Tarski (1941). A history of work on the subject is Maddux (1990).

Given relative terms such as "friend of" and "enemy of" (more briefly "f" and "e"), Peirce studied various operations on these terms such as the following:

```
(union)                   friend of or enemy of
```

A pair <a,b> stands in this relation if and only if if stands in one or both of the relations. In symbols "f + e".

```
(intersection)            friend of and enemy of
```

A pair <a,b> stands in this relation if and only if if stands in both of the relations. In symbols "f . e".

```
(relative product)        friend of an enemy of
```

A pair <a,b> stands in this relation if and only if there is a c such a is a friend of c and c is an enemy of b. In symbols "f ; e".

```
(relative sum)            friend of every enemy of
```

A pair <a,b> stands in this relation if and only if a is the friend of every object c that is the enemy of b. In symbols "f , e" (Peirce uses a dagger rather than a comma)

```
(complement)              is not a friend of
```

A pair <a,b> stands in this relation if and only if <a,b> does not stand in the friend-of relation. In symbols "-f" (Peirce places a bar over the relative term).

```
(converse)                is one to whom the other is friend
```

A pair <a,b> stands in this relation if and only if b is a friend of a. In symbols "~f" (Peirce places an upwards facing semi-circle over the relative term).

Peirce presented numerous theorems involving his operations on relative terms. Examples of the numerous such laws identified by Peirce are:

```
~(r + s)     =   ~r + ~s
```

```
-(r ; s)     =   -r , -s

(r . s) , t  =   (r , s) . (r , t)
```

Peirce's calculus of relations has been criticized for remaining unnecessarily tied to previous work on Boolean algebra and the equational paradigm in mathematics. It has been frequently claimed that real progress in logic was only realized in the work of Frege and later work of Peirce in which the equational paradigm was dropped and the powerful expressive ability of quantification theory was realized.

Nevertheless, Peirce's calculus of relations has remained a topic of interest to this day as an alternative, algebraic approach to the logic of relations. It has been studied by Lowenheim, Tarski and others. Lowenheim's famous theorem was originally a result about the calculus of relations rather than quantification theory, as it is usually presented today. Some of the subsequent work on the calculus of relations is outlined in Maddux (1990).

Existential Graphs

Following his development of quantification theory, Peirce developed a graphical system for analyzing logical reasoning that he felt was superior in analytical power to his algebraic and quantificational notations. A large portion of this material is reprinted as volume 4, book 2 of Peirce (1933) and is discussed, for example, in Roberts (1964), Roberts (1973), Zeman (1964) and Hammer (1996). This system of "existential graphs" encompassed propositional logic, first-order logic with identity, higher-order logic, and modal logic.

The "alpha" portion of the system of existential graphs is concerned with propositional logic. Conjunction is indicated by juxtaposing graphs next to one another. Negation is indicated by enclosing a graph within an enclosed circle or other closed figure, which Peirce calls a "cut". Here (and occasionally in Peirce's writings) cuts will be indicated by matching parentheses. So

```
(P)
```

is equivalent to "not P", and

```
(P(Q))
```

is equivalent to "if P then Q". Observe that this is the same graph as

```
((Q)P)
```

because order is irrelevant. Juxtaposition and enclosure are the only relevant logical operations. Peirce provides five elegant rules of inference that form a complete set. The rules are Insertion in Odd, Erasure

in Even, Iteration, Deiteration, and Double Cut.

Insertion in Odd Any graph can be added to an area enclosed within an odd number of cuts.

The following table gives some examples of this rule:

```
((B))          (A (B (C)))      (A)
((B)A)         (A (B (C D)))    ((B)A)
```

In the first case from "not not B", "If A then B" is obtained. In the second case from "If A, then if B then C", "If A, then if B then both C and D" is obtained. In the third case from "not A", "If A then B" is obtained.

Erasure in Even Any graph can be erased that occurs within an even number of cuts.

The following table gives some examples of this rule:

```
(A(B))         (A (B (C)))      B(A)
(A())          (A (  (C)))      B
```

In the first case from "if A then B", "if A then true" is obtained. In the second case from "If A, then if B then C", "if A, then not C" is obtained. In the third case from "not A and B", "B" is obtained.

Iteration Any graph can be recopied to any other area that occurs within all the cuts the original occurs within.

Here are some examples of Iteration:

```
(A(B))         ( (A) (B) )      B(A)
(A(AB))        ( (A) (B(A)) )   B(A)B(A)
```

In the first case from "if A then B", "if A then both A and B" is obtained. In the second case from "If not A then B", "if not A then both B and not A" is obtained. In the third case from "B and not A", "B and not A and B and not A" is obtained.

Deiteration Any graph that could have been obtained by iteration can be erased.

Here are some examples of Deiteration:

```
(A(AB))        ( (A) (B(A)) )   B(A)B(A)
(A(B))         ( (A) (B) )      B(A)
```

These are just the exact converses of the examples of Iteration.

Double cut Two cuts can be put immediately around any graph, and two cuts immediately around any graph can be erased.

Here are some examples of Deiteration:

```
(A(B))           (A)              ((B))(A)
(((A))(B))       (((A)))          B(A)
```

From "if A then B", "if not not A, then B" is obtained. From "not A", "not not not A" is obtained. From "not not B and not A", "B and not A" is obtained.

A proof of modus ponens:

```
P  (P(Q))       premises: (i) if P then Q.  (ii) P
P  ( (Q))       Deiteration
P     Q         Double Cut
   Q            Erasure in Even
```

A proof of "if A, then if B then A":

```
(())            Double Cut
(A())           Insertion in Odd
(A( A ))        Iteration
(A( ((A)) ))    Double Cut
(A( (B(A)) ))   Insertion in Odd
```

A proof of "if not B then not A" from "if A then B":

```
(A(B))          premise
( ((A)) (B))    Double Cut
```

Finally, a proof of "if A then C" from "if A then B" and "if B then C":

```
(A(B))  (B(C))          premises
(A( B (B(C)) )) (B(C))  Iteration
(A( B (B(C)) ))         Erasure in Even
(A( B ( (C)) ))         Deiteration
(A( B    C   ))         Double Cut
(A(C))                  Erasure in Even
```

The "beta" portion of Peirce's system of existential graphs is equivalent to first-order logic with identity. It does not use variables to fill the argument places of predicates. Instead, the argument places are filled by drawn lines. Two or more such argument places can be identified (analogous to filling them with the same variable) by connecting them with a drawn line. These "lines of identity" play the role of quantifiers as well as variables. The order of interpretation of the various lines of identity and cuts of a beta graph is determined by the portions of lines of identity that are enclosed within the fewest cuts. Elements enclosed by fewest cuts are interpreted before more deeply embedded elements. Rules of inference for the beta portion are generalizations of the rules for the alpha portion. They allow lines of identity to be manipulated in various ways, such as erasing portions of lines connecting loose ends, extending loose ends, and retracting loose ends. More information about the beta portion of the system of existential graphs can be found in Roberts (1973).

Moral Skepticism

"Moral Skepticism" names a diverse collection of views that deny or raise doubts about various roles of reason in morality. Different versions of moral skepticism deny or doubt moral knowledge, justified moral belief, moral truth, moral facts or properties, and reasons to be moral.

Despite this diversity among the views that get called "moral skepticism", many people have very strong feelings about moral skepticism in general. One large group finds moral skepticism obvious, because they do not see how anyone could have real knowledge of anything's moral status. Others see moral skepticism as so absurd that any moral theory can be refuted merely by showing that it leads to moral skepticism. Don't you know, they ask, that slavery is morally wrong? Or terrorism? Or child abuse? Skeptics who deny that we have reason to believe or obey these moral judgments are seen as misguided and dangerous. The stridency and ease of these charges suggests misunderstanding, so we need to be more charitable and more precise.

1. Varieties of Moral Skepticism

Moral skeptics differ in many ways, but they share a common core that makes them all moral skeptics. What makes moral skepticism *moral* is that it concerns morality rather than other topics. Moral skeptics might go on to be skeptics about the external world or about other minds or about induction or about all beliefs, but

these other skepticisms are not entailed by moral skepticism alone.

What makes moral skeptics *skeptics* is that they raise doubts about common beliefs. Moral skeptics then differ in the kinds of doubts that they raise. Since general skepticism is an epistemological view about the limits of knowledge, the most central version of moral skepticism is the one that raises doubts about moral knowledge.

There are two main traditions in epistemological skepticism. Cartesian skepticism (which gets its name from Descartes, although he argued against it) is the claim that nobody ever knows anything. This claim is not made by Pyrrhonian skeptics. They also don't deny it. They have so much doubt that they refrain from taking any position on whether anything can be known.

Moral skepticism comes in two corresponding kinds. *Pyrrhonian moral skeptics* refuse to admit that some people sometimes know that some substantive moral belief is true. They doubt that moral knowledge is possible. Still, they do not go on to claim that moral knowledge is impossible. They doubt that, too. Their doubts are so extreme that they do not make any claim one way or the other about the possibility of moral knowledge. Similar views can be adopted regarding justified moral belief.

In contrast, Cartesian-style moral skeptics make definite claims about the epistemic status of moral beliefs:

> *Skepticism about moral knowledge* is the claim that nobody ever knows that any substantive moral belief is true. (Cf. Butchvarov 1989, 2.)

Some moral skeptics also make this stronger claim:

> *Skepticism about justified moral belief* is the claim that nobody is ever justified in holding any substantive moral belief.

(The relevant way of being justified is specified in Sinnott-Armstrong 1996, 17-24.) These two claims and Pyrrhonian moral skepticism all fall under the general heading of *epistemological moral skepticism*.

The relation between these two claims depends on the nature of knowledge. If knowledge implies justified belief, as is traditionally supposed, then skepticism about justified moral belief implies skepticism about moral knowledge. However, even if knowledge does require justified belief, it does not require *only* justified belief, so skepticism about moral knowledge does not imply skepticism about justified moral belief.

One reason is that knowledge implies truth, but justified belief does not. Thus, if moral beliefs cannot be true, they can never be known to be true, but they still might be justified in some way that is independent of truth. As a result, skepticism about moral knowledge is implied, but skepticism about justified moral belief is not implied, by yet another form of moral skepticism:

> *Skepticism about moral truth* is the claim that no substantive moral belief is true.

This claim is usually based on one of two more specific claims:

> *Skepticism about moral truth-aptness* is the claim that no substantive moral belief is either true or false.
>
> *Skepticism with moral error* is the claim that every substantive moral belief is false.

These last three kinds of moral skepticism are not epistemological, for they are not directly about knowledge or justification. Instead, they are usually based on views of moral language or metaphysics.

Some philosophers of language argue that sentences like "Cheating is morally wrong" are neither true nor false, because they resemble pure expressions of emotion (such as "Boo Knicks") or prescriptions for action (such as "Go Celtics"). Such expressions and prescriptions are neither true nor false. Thus, if these analogies hold, then substantive moral beliefs are also neither true nor false. They are not apt for evaluation in terms of truth. For this reason, such linguistic theories are often taken to imply skepticism about moral truth-aptness. Views of this general sort are defended by Ayer (1952), Stevenson (1944), Hare (1981), Gibbard (1990), and Blackburn (1993), although recent versions often allow some minimal kind of moral truth while denying that moral beliefs can be true or false in the same robust way as factual beliefs.

Such views are often described as *non-cognitivism*. That label is misleading, since etymology suggests that cognitivism is about cognition, which is knowledge. Since knowledge implies truth, skepticism about moral truth-aptness has implications for moral knowledge, but it is directly about truth-aptness and not about moral knowledge.

Whatever you call it, skepticism about moral truth-aptness runs into several problems. If moral assertions have no truth-value, it is hard to see how they can fit into truth-functional contexts, such as negation, disjunction, and conditionals. Such contexts are also unassertive, so they do not express the same emotions or prescriptions as when moral claims are asserted. Indeed, no particular emotion or prescription seems to be expressed when someone says, "Eating meat is not morally wrong." Expressivists and prescriptivists respond to such objections, but their responses remain controversial. (Cf. Sinnott-Armstrong 2000.)

Many moral theorists conclude that moral assertions express not only emotions or prescriptions but also *beliefs*. In particular, they express beliefs that certain acts, institutions, or people have certain moral properties (such as moral rightness or wrongness) or beliefs in moral facts (such as the fact that a certain act is morally right or wrong). This non-skeptical linguistic analysis still does not show that such moral claims can be true, since assertions can express beliefs that are false. Indeed, the falsity of all substantive moral assertions and beliefs follows if one combines the linguistic view that moral assertions express beliefs, a view of truth on which a belief cannot be true unless it corresponds to a fact, and one more thesis:

> *Skepticism about moral reality* is the claim that no moral facts or properties exist.

This metaphysical claim is, thus, a reason for skepticism with moral error, as developed by Mackie (1977). Opponents of such "error theories" often object that not all moral beliefs can be false because some moral beliefs deny other moral beliefs. However, error theorists can allow a negative moral belief (such as that

eating meat is *not* morally wrong) to be true, but only if it merely denies the truth of the corresponding positive moral belief (that eating meat *is* morally wrong). If such denials of moral beliefs are not substantive moral beliefs (as denials of astrological beliefs are not astrology), then *error theorists* can maintain that all substantive moral beliefs are false.

Error theorists and skeptics about moral truth-aptness disagree about the content of moral assertions, but they still agree that no substantive moral claim or belief is true, so they are both skeptics about moral truth. None of these skeptical theses is implied by either skepticism about moral knowledge or skepticism about justified moral belief. Some moral claims might be true, even if we cannot know or have justified beliefs about which ones are true. However, a converse implication seems to hold: If knowledge implies truth, and if moral claims are never true, then there is no knowledge of what is moral or immoral (assuming that skeptics deny the same kind of truth that knowledge requires). Nonetheless, since the implication holds in only one direction, skepticism about moral truth is still distinct from all kinds of epistemological moral skepticism.

Yet another non-epistemological form of moral skepticism answers the question "Why be moral?" This question is used to raise many different issues. Almost everyone admits that there is sometimes some kind of reason to be moral. However, many philosophers deny various universal claims, including the claims that there is always *some* reason to be moral, that there is always a distinctively *moral* (as opposed to self-interested) reason to be moral, and/or that there is always an *adequate* reason to make it irrational not to be moral or at least not irrational to be moral. These distinct denials can be seen as separate forms of *practical moral skepticism*, which are discussed in more detail in the following supplementary document:

> Supplement on Practical Moral Skepticism

Practical moral skepticism resembles epistemological moral skepticism in that both kinds of skepticism deny a role to reasons in morality. However, epistemological moral skepticism is about reasons for *belief*, whereas practical moral skepticism is about reasons for *action*. Moreover, practical moral skeptics usually deny that there is *always* enough reason for moral action, whereas epistemological moral skeptics usually deny that there is *ever* an adequate reason for moral belief. Consequently, practical moral skepticism does not imply epistemological moral skepticism. Some moral theorists do assume that a reason to believe that an act is immoral cannot be adequate unless it also provides a reason not to do that act. However, even if the two kinds of reasons are related in this way, they are still distinct, so practical moral skepticism must not be confused with epistemological moral skepticism.

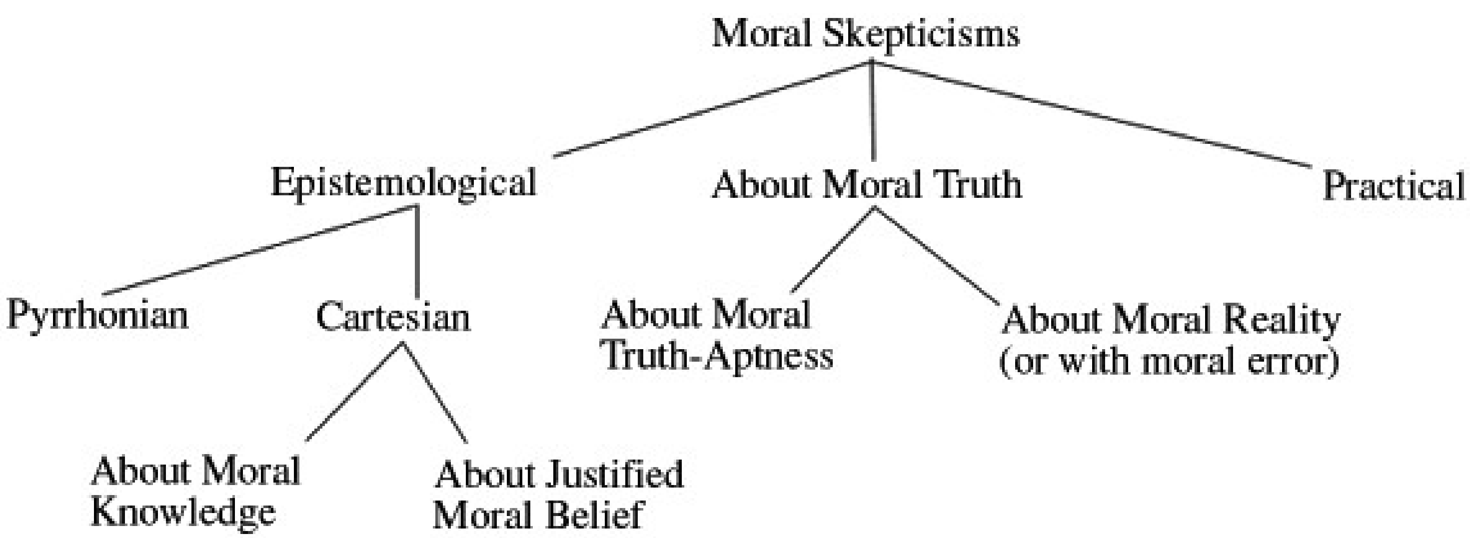
Overall, then, we need to distinguish the following kinds of epistemological moral skepticism:

> *Skepticism about moral knowledge* = nobody ever knows that any substantive moral belief is true.
>
> *Skepticism about justified moral belief* = nobody is ever justified in holding any substantive moral belief.
>
> *Pyrrhonian moral skepticism* withholds assent from skepticism about moral knowledge, skepticism about justified moral belief, and their denials.

We also need to distinguish these from several non-epistemological kinds of moral skepticism:

> *Skepticism about moral truth* = no substantive moral belief is true.
>
> *Skepticism about moral truth-aptness* = no substantive moral belief is either true or false.
>
> *Skepticism with moral error* = every substantive moral belief is false.
>
> *Skepticism about moral reality* = no moral properties or facts exist.
>
> *Practical moral skepticism* = there is not always any or adequate or distinctively moral reason to be moral.

These kinds of moral skepticism can be diagrammed as follows:



Skepticism about justified moral belief will be the primary topic for the rest of this entry, and I will refer to it henceforth simply as moral skepticism.

2. A Presumption against Moral Skepticism?

Opponents often accuse moral skepticism of leading to immorality. However, skeptics about justified moral belief can act well and be nice people. They need not be any less motivated to be moral, nor need they have (or believe in) any less reason to be moral than non-skeptics have (or believe in). Moral skeptics can hold substantive moral beliefs just as strongly as non-skeptics. Their substantive moral beliefs can be common and plausible ones. Moral skeptics can even believe that their moral beliefs are true by virtue of corresponding to an independent moral reality. All that moral skeptics deny is that their (or anyone's) moral beliefs are justified. This meta-ethical position about the epistemic status of moral beliefs need not trickle down and

infect anyone's substantive moral beliefs or actions.

Critics still argue that moral skepticism conflicts with commonsense. Most people think that they are justified in holding many moral beliefs, such as that it is morally wrong to beat your opponent senseless with a baseball bat just because she beat you in a baseball game. People also claim moral knowledge, such as when a neighbor says, "I know that it is wrong for him to spank his daughter so hard, but I don't know what I should do about it." Moral skepticism conflicts with these common ways of talking and thinking, so moral skeptics seem to owe us some argument for their claim.

Moral skepticism is, moreover, a universal and abstruse claim. It is the claim that all moral beliefs have a certain epistemic status. Normally one should not make such a strong claim without some reason. One should not, for example, claim that all astronomical beliefs are unjustified unless one has some reason for this claim. Analogously, it seems that one should not claim that all moral beliefs are unjustified unless one has some positive argument. Thus, its form, like its conflict with commonsense, seems to create a presumption against moral skepticism.

Moral skeptics, in response, sometimes try to shift the burden of proof to their opponents. Anyone who makes the positive moral claim that homosexual sodomy is morally wrong seems to need some reason for that claim, just as someone who claims that there is life on Mars seems to need evidence for that claim. If the presumption is always against those who make positive moral claims, then it is opponents of moral skepticism who must carry the burden of proof. Or, at least, moral skeptics can deny that the burden of proof is on moral skeptics. Then moral skeptics may criticize any moral belief or theory without needing to offer any positive argument for moral skepticism, and their opponents need to take moral skepticism seriously enough to argue against it. (Cf. Copp 1991.)

This controversy about burden of proof might be resolved by distinguishing Cartesian-style skepticism from Pyrrhonian moral skepticism. Cartesian-style skeptics about justified moral belief make a universal claim that conflicts with commonsense, so they seem to have the burden of arguing for their claim. In contrast, Pyrrhonian moral skeptics neither make nor deny any claim about the epistemic status of any moral belief. They simply raise doubts about whether moral beliefs are ever justified. This difference suggests that Pyrrhonian moral skeptics do not take on as much burden of proof as do Cartesian-style skeptics about justified moral belief.

3. Arguments for Moral Skepticism

Whether or not they need to, moral skeptics do offer a variety of arguments for their position. Here I will focus on arguments for Cartesian-style skepticism about justified moral belief, but essentially the same arguments could be formulated to support skepticism about moral knowledge. I will return later to Pyrrhonian moral skepticism. Also, although here I will sometimes formulate these arguments in terms of moral truth, they could be restated in ways more congenial to skeptics about moral truth-aptness.

3.1 Moral Disagreements

The simplest and most common argument for moral skepticism is based on observed facts: Smart and well-meaning people disagree about the moral permissibility of abortion, affirmative action, capital punishment, active euthanasia, nuclear deterrence, welfare reform, civil rights, and so on. Many observers generalize to the conclusion that no moral claim will be accepted by everyone.

However, all of these disagreements together still do not exclude the possibility of agreement on other moral beliefs. Maybe nobody denies that it is morally wrong to torture babies just to get sexual pleasure. Moreover, even if no moral belief is immune to disagreement, the fact that some people disagree with me does not prove that I am unjustified in holding my moral belief. I might be able to show them that I am right, or they might agree with me under ideal circumstances, where they are better informed, more thoughtful, less partial, and so on. Moral disagreements that are resolvable do not support moral skepticism, so any argument for moral skepticism from moral disagreement must show that moral disagreements are unresolvable on every issue. That will require a separate argument.

3.2 Moral Explanations

Another way to argue for moral skepticism is to cite a requirement on justified belief. On one view, we cannot be justified in believing any claim unless the truth of that claim is necessary for the best explanation of some independent fact. Some philosophers then argue that moral truths are never necessary for the best explanation of any non-moral fact. (Cf. Harman 1977.) It follows that we cannot be justified in believing any moral claim.

This argument can be countered in two ways. First, one could deny that justified belief must always involve inference to the best explanation. It is not clear, for example, that beliefs about mathematics or colors are or must be grounded in this way, although such beliefs still seem justified. (Compare Harman 1977 on mathematics and color.)

Another common response is that sometimes a moral truth is necessary for the best explanation of a non-moral fact. (Cf. Sturgeon 1985.) Hitler's vices are sometimes cited to explain his actions. Slavery's injustice has been said to explain its demise. And the fact that everyone agrees that it is morally wrong to torture babies just to get sexual pleasure might be best explained by the fact that this common belief is true.

Moral skeptics usually reply that such explanations can be replaced by non-moral descriptions of Hitler, slavery, and torture. If such replacements are always available, then moral truths are not necessary for the best explanation of anything. However, it is not clear whether or not non-moral explanations really do work as well as moral explanations in all cases. Nor is it clear whether inference to the best explanation must lie behind all justified belief.

3.3 A Regress

The next argument develops a skeptical regress. This form of argument, which derives from Sextus Empiricus (2000), is sometimes used to support the more general skeptical claim that no belief about any topic is justified. Nonetheless, it might seem to have special force within morality.

The argument's goal is to rule out all of the ways in which a person might be justified in believing something. It starts with a definition:

> A person *S* is *inferentially* justified in believing a claim that *p* if and only if what makes *S* justified is (at least in part) *S*'s ability to infer *p* from some belief of *S*.

There are, then, only two ways to be justified:

> (1) If any person *S* is justified in believing any moral claim that *p*, then *S* must be justified either inferentially or non-inferentially.

The moral skeptic denies both possibilities in turn. First:

> (2) No person *S* is ever non-inferentially justified in believing any moral claim that *p*.

Moral intuitionists and some moral contextualists deny premise (2), but moral skeptics argue that too many beliefs would be justified if people did not need any reason or inference to support their moral beliefs. If Thelma could be non-inferentially justified in believing that eating meat *is* wrong, then Louise could also be non-inferentially justified in believing that eating meat is *not* wrong, and Nick could be non-inferentially justified in believing that it is morally wrong to eat vegetables. Conflicting beliefs can sometimes both be justified, but it seems less plausible to hold that such conflicting moral beliefs are all justified without any inference when each believer knows that other people disagree. If such conflicting beliefs are not justified in the absence of a reason, and if such conflicts are pervasive enough to undermine all non-inferential justification, then premise (2) is true.

Premises (1) and (2) together imply an intermediate conclusion:

> (3) If any person *S* is justified in believing any moral claim that *p*, then *S* must be justified inferentially.

This means that, to be justified, *S* must be able to infer *p* from some other beliefs held by *S*. But which other beliefs? There are three main possibilities:

> (4) If any person *S* is inferentially justified in believing any moral claim that *p*, then S must be justified by an inference with either (a) no normative premises or (b) some normative premises but no moral premises or (c) some moral premises.

To the first possibility, moral skeptics respond with a variation on the maxim that you can't get "ought" from "is":

> (5) No person *S* is ever justified in believing any moral claim that *p* by an inference with no normative premises.

Naturalists in moral epistemology deny (5) when they try to derive a conclusion that an act is morally wrong from purely non-normative features of the act. However, moral skeptics retort that such derivations always depend on a suppressed premise that all acts with those features are morally wrong. Such a suppressed premise seems moral and, hence, normative. If so, the naturalist's inference does not really work without any normative premises. Naturalists still might invoke inferences to the best moral explanation, but then moral skeptics can deny that any moral hypothesis provides the best explanation independently of prior moral assumptions.

The next possibility is to justify a moral conclusion with an inference whose premises are not moral but are normative in another way. This approach, which is adopted by contractarians among others, can be called *normativism*. Normativists usually start with premises about rationality and impartiality that are each supposed to be normative but morally neutral. If rational impartial people under relevant circumstances would agree to certain moral standards, this is supposed to show that the corresponding moral beliefs are true or justified.

One problem for this general approach is that different theories of rationality, impartiality, and relevant circumstances are all questionable and lead to contrary moral beliefs. This suggests that such theories are not morally neutral, so these derivations do not avoid moral premises. Other arguments from non-moral norms to moral conclusions run into similar problems. Moral skeptics conclude that:

> (6) No person *S* is ever justified in believing any moral claim that *p* by an inference with some normative premises but no moral premises.

Premises (4)-(6) imply another intermediate conclusion:

> (7) If any person *S* is justified in believing any moral claim that *p*, then *S* must be justified by an inference with some moral premise.

In short, moral beliefs must be justified by moral beliefs.

This creates a problem. Although the justifying beliefs must include some moral beliefs, not just any moral beliefs will do:

> (8) No person *S* is ever justified in believing a moral claim that *p* by an inference with a moral premise unless *S* is also justified in believing that moral premise itself.

Premise (8) is denied by some contextualists, who claim that, even if a moral belief is not justified, if it is shared within a certain social context, then it may be used to justify other moral beliefs. However, moral skeptics reply that social contexts are often corrupt, and no social context by itself can show that a moral belief is true, reliable, or, hence, justified in the relevant way.

But then how can moral premises be justified? Given (7)-(8), the moral premises must be justified by inferring them from still other moral beliefs which must also be justified by inferring them from still other moral beliefs, and so on. To justify a moral belief thus requires a branching tree or chain of justifying beliefs

or premises, which must have one of two forms:

> (9) If any person *S* is justified in believing any moral claim that *p*, then *S* must be justified by a chain of inferences that either goes on infinitely or circles back to include *p* itself as an essential premise.

The first of these two alternatives is almost never defended, since most accept:

> (10) No person *S* is ever justified in believing any moral claim that *p* by a chain of inferences that goes on infinitely.

Moral skeptics also deny the other possibility:

> (11) No person *S* is ever justified in believing any moral claim that *p* by a chain of inferences that includes *p* as an essential premise.

Any argument that includes its conclusion as a premise will be valid. However, anyone who doubts the conclusion will have just as much reason to doubt the premise. So, according to skeptics, nothing is gained when a premise just restates the belief to be justified.

Premise (11) is opposed by moral coherentists. Recent coherentists emphasize that they do not infer a belief from itself in a linear way. Instead, a moral belief is supposed to be justified because it coheres in some way with a body of beliefs that is coherent in some way. Still, moral skeptics deny that coherence is enough to make a moral belief justified. One reason is that the internal coherence of a set of beliefs is not evidence of any relation to anything outside the beliefs. Another reason is that every belief — no matter how ridiculous — can cohere with some body of beliefs that is internally coherent. Because so many incompatible systems seem coherent, moral skeptics deny that coherence alone is sufficient to make beliefs justified.

Now the moral skeptic can draw a final conclusion. (9)-(11) imply:

> (12) No person is ever justified in believing any moral claim.

This is skepticism about justified moral beliefs.

Many opponents find this conclusion implausible, but the regress argument is valid. Hence, its conclusion cannot be avoided without denying one of its premises. Different opponents of moral skepticism deny different premises, as I indicated. However, it remains to be seen whether any of these responses to the regress argument is defensible in the end.

3.4 Skeptical Hypotheses

The final kind of argument derives from René Descartes (1979). I do not seem justified in believing that what I see is a lake if I cannot rule out the possibility that it is a bay or a bayou. Generalizing, if there is any

contrary hypothesis that I cannot rule out, then I am not justified in believing that what I see is a lake. This is supposed to be a common standard for justified belief. When this principle is applied thoroughly, it leads to skepticism. All a skeptic needs to show is that, for each belief, there is some contrary hypothesis that cannot be ruled out. It need not be the same hypothesis for every belief, but skeptics usually buy wholesale instead of retail, so they seek a single hypothesis that is contrary to all (or many common) beliefs and which cannot be ruled out in any way.

The famous Cartesian hypothesis is of a demon who deceives me in all of my beliefs about the external world, while also ensuring that my beliefs are completely coherent. This possibility cannot be ruled out by any experiences or beliefs, because of how the deceiving demon is defined. This hypothesis is also contrary to my beliefs about the lake. So my beliefs about the lake are not justified, according to the above principle. And there is nothing special about my beliefs about the lake. Everything I believe about the external world is incompatible with the deceiving demon hypothesis. Skeptics conclude that no such belief is justified.

This argument is often dismissed on the grounds that there is no reason to believe in a deceiving demon or that nobody really doubts whether there is an external world. In contrast, some people do seem to adopt a parallel skeptical hypothesis in morality:

> Moral Nihilism = Nothing is morally wrong.

Moral nihilism here is not about what is semantically or metaphysically possible. It is just a substantive, negative, existential claim that there does not exist anything that is morally wrong. This thesis has been supported by various reasons, including the pervasiveness of moral disagreement and our supposed ability (with the help of sociobiology and other sciences) to explain moral beliefs without reference to moral facts. Since people do take moral nihilism seriously and even argue for it (Joyce 2001), moral nihilism cannot be dismissed as readily as Descartes's deceiving demon.

Moral skeptics can then argue that the definition of moral nihilism forestalls any refutation. Since moral nihilists question all of our beliefs in moral wrongness, they leave us with no starting points on which to base arguments against them without begging the question at issue. If this trick works, then it fits right into a skeptical hypothesis argument.

This argument is clearest when applied to an example. If nothing is morally wrong, as moral nihilists claim, then it is not morally wrong to torture babies just for fun. So, according to the general principle above, one must be able to rule out moral nihilism in order to be justified in believing that torturing babies just for fun is morally wrong. Moral skeptics conclude this moral belief is not justified. More precisely:

> (1) I am not justified in believing the denial of moral nihilism.
>
> (2) I am justified in believing that [(*p*)"It is morally wrong to torture babies just for fun" entails (*q*) the denial of moral nihilism].
>
> (3) If I am justified in believing that *p*, and I am justified in believing that *p* entails *q*, then I am justified in believing that *q*.

(4) Therefore, I am not justified in believing that it is morally wrong to torture babies just for fun.

This moral belief is not especially problematic in any way. It seems as obvious as any moral belief. So the argument can be generalized to cover any moral belief. Moral skeptics conclude that no moral belief is justified.

There are two main responses to such skeptical hypothesis arguments. First, some anti-skeptics deny (1) and claim that skeptical hypotheses can be ruled out somehow. They might argue that moral nihilism is internally inconsistent or meaningless. If so, it can be ruled out by logic and semantics alone. However, moral nihilism does seem consistent and meaningful, according to all plausible theories of moral language, including expressivism, realism, and constructivism (Sinnott-Armstrong 1995). Moral nihilism is also not subject to the kind of argument that Putnam (1981) deploys against more general skeptical scenarios. Anti-skeptics still might argue that moral nihilism is incompatible with some non-moral facts or observations or their best explanations. If so, it can be ruled out by arguments with only non-moral premises. However, all such attempts to cross the dreaded is-ought gap are questionable. A third way to rule out moral nihilism would be based on common moral beliefs that are incompatible with moral nihilism. However, just as it would beg the question to use common beliefs about the external world to rule out a deceiving demon hypothesis, so it would also beg the question to argue against moral nihilism on the basis of common moral beliefs — no matter how obvious those beliefs might seem to us, and no matter how well these common beliefs cohere together. Moral skeptics conclude that there is no way to rule out moral nihilism, just as premise (1) claims.

Another recent response is to deny premise (3). This is a principle of *closure*. Since a belief entails the denial of every contrary hypothesis, this closure principle in effect says that I cannot be justified in believing *p* unless I am justified in denying every hypothesis contrary to *p* — that is, unless I can rule out *all* contrary hypotheses. This principle has been denied by relevant alternative theorists, who claim instead that only relevant hypotheses need to be ruled out. On this theory, if skeptical hypotheses are not relevant, then a belief that it is morally wrong to torture babies just for fun can be justified, even if the believer cannot rule out moral nihilism.

For this response to have force, however, opponents of moral skepticism need to say why moral nihilism is irrelevant. It seems relevant, for the simple reason that it is directly contrary to the moral belief that is supposed to be justified. Moreover, there can be reasons to believe in moral nihilism. Some people are led to moral nihilism by the absence of any defensible theory of morality. If consequentialism is absurd or incoherent, as some critics argue, and if deontological restrictions and permissions are mysterious and unfounded, as their opponents argue, then some people might believe moral nihilism for reasons similar to those that led scientists to reject phlogiston. Another basis for moral nihilism cites science. If all of our moral beliefs can be explained by sociobiology and/or other social sciences without assuming that any moral belief is true, then some might accept moral nihilism for reasons similar to those that lead many people to reject witches or elves. The point is not that such reasons for moral nihilism are adequate. The point here is only that there is enough prima facie reason to believe moral nihilism that it cannot be dismissed as irrelevant on this basis. If moral nihilism is relevant, and if closure holds for all or at least relevant alternatives, and if moral nihilism cannot be ruled out in any way, then moral skepticism seems to follow.

3.5 Relations Among the Arguments

These arguments for moral skepticism differ in many ways, but they seem mutually supportive. One crucial premise in the skeptical hypothesis argument claims that nothing can rule out moral nihilism. The best way to support that premise is to criticize each method for ruling out moral nihilism. That is just one instance of what the regress argument does more generally. The argument from moral explanations excludes yet another way to rule out moral nihilism. So, if these other arguments work, they support a crucial premise in the skeptical hypothesis argument.

Conversely, one crucial premise in the regress argument claims that no moral belief can be justified non-inferentially. Another crucial premise, (8), claims that an inference cannot justify its conclusion unless its premises are justified. These premises claim, in effect, that a moral belief needs a certain kind of justification. One way to establish this need is to point to a contrary possibility that is not yet ruled out. That is what the skeptical hypothesis argument does. Another way to confirm this need is to show that the moral belief is controversial. That is what the argument from moral disagreement does. Thus, if these other arguments work, they support a crucial premise in the regress argument.

To skeptics, this mutual support might seem desirable. Anti-skeptics, however, might object that this mutual support makes the arguments jointly circular. In the end, the force of the arguments depends on the defensibility of non-skeptical views in moral epistemology. If moral intuitionism, coherentism, naturalism, or normativism works to justify some moral beliefs and/or to rule out moral nihilism, then this will undermine the crucial premises in the arguments for moral skepticism. But that remains to be seen.

4. Pyrrhonian Moral Skepticism

Although the arguments for moral skepticism are hard to refute, most people reject their conclusion. This makes it natural to seek some compromise. Various compromises have been proposed, but here I will focus on one in the Pyrrhonian tradition.

This Pyrrhonian position can be explained in terms of contrast classes, which should be familiar from shopping: Are jumbo shrimp large? An answer of "Yes" or "No" would be too simple. Jumbo shrimp are large for shrimp, but they are not large for seafood. Analogously, someone can be justified in believing a claim out of one contrast class, even if the same person is not justified in believing the same claim out of a different contrast class. For example, suppose a father sees an animal in a zoo and believes it to be a zebra. If the father has adequate evidence that the animal is not a lion or a horse, then the father can be justified in believing that it is a zebra out of the contrast class {lion, horse, zebra}. Nonetheless, the father still might not have any evidence that the animal is not a mule painted to look like a zebra. Then the father is not justified in believing that the animal is a zebra out of the contrast class {lion, horse, zebra, painted mule}.

The same situation arises with moral beliefs. The father might be justified in believing that he should tell his children the truth rather than lying to them, even if the father is not justified in believing that he should tell his children the truth as opposed to keeping quiet. Or someone might be justified in favoring Kantian moral

theory over act-utilitarianism, because of counterexamples to act-utilitarianism, without being justified on that basis in favoring Kantian moral theory over rule-utilitarianism, if that alternative is not subject to the same counterexamples.

More generally, we can distinguish two contrast classes:

> The *extreme contrast class* for a moral belief that *p* includes every moral claim that is contrary to *p*, including moral nihilism.
>
> The *modest contrast class* includes all and only those contrary moral beliefs that most people would take seriously in an ordinary discussion.

Since most people do not take moral nihilism seriously in ordinary discussions, the modest contrast class does not include moral nihilism. Thus, anyone who can rule out all other members of the modest contrast class but cannot rule out moral nihilism is justified in believing the moral claim out of the modest contrast class but not out of the extreme contrast class.

These classes enable us to distinguish two versions of moral skepticism:

> *Skepticism about modestly justified moral belief* is the claim that nobody is ever justified out of the modest contrast class in holding any substantive moral belief.
>
> *Skepticism about extremely justified moral belief* is the claim that nobody is ever justified out of the extreme contrast class in holding any substantive moral belief.

The latter but not the former follows if nobody can ever rule out moral nihilism, but some believers sometimes can rule out all other members of the modest contrast class.

Critics will ask, "If someone is justified out of the modest contrast class but not out of the extreme contrast class, is this believer just plain justified (period or without qualification)?" That, of course, depends on what it means to say that a believer is justified (without qualification). On one plausible account, to say that a believer is justified (without qualification) is to say that the believer is justified out of the *relevant* contrast class. But which contrast class is relevant when?

Contextualists say that the modest contrast class is relevant in everyday contexts, such as hospital ethics committees, where it would be seen as a distraction to discuss moral nihilism. Nonetheless, the extreme contrast class is said to be relevant in philosophical contexts, such as philosophy classes where moral nihilism is taken seriously. This allows contextualists to hold that a doctor in a hospital ethics committee is justified in believing a moral claim that a philosophy student with the same evidence would not be justified in believing.

Problems arise when contexts cross. Consider a philosophy student who says that the doctor on the ethics committee is not justified in believing the moral claim. Is the student's contrast class (with moral nihilism) or

the doctor's contrast class (without moral nihilism) really relevant to the student's judgment about the doctor's belief? And what if the doctor says that the student really is justified while in the philosophy class? When epistemic assessments cross contexts in such ways, sometimes the believer's context seems relevant, but sometimes the assessor's context seems relevant, so it is hard to see any basis for claiming that either context or either contrast class really is the relevant one for assessing whether the believer really is justified (without qualification).

Such paradoxes lead Pyrrhonian moral skeptics to renounce all claims about which contrast class is really relevant. They can still talk about whether someone is justified in believing a moral claim out of a specified contrast class, but they refuse to take any position on whether the believer is justified (without qualification). Pyrrhonian moral skeptics can then (i) accept skepticism about extremely justified moral belief but (ii) deny skepticism about modestly justified moral belief and (iii) refuse to either assert or deny (Cartesian-style) skepticism about any moral belief being justified (without qualification).

Whether or not this view is finally defensible, the point here is just that such a Pyrrhonian compromise is available and attractive to those who want to avoid Cartesian-style moral skepticism but see no way to refute it. There are also other possible compromises that combine different strands in moral skepticism. That is what makes it so fascinating to study this important view.

Supplement to Moral Skepticism

Practical Moral Skepticism

Practical moral skepticism answers the common question, "Why be moral?" This question, like many philosophical questions, is too short to be clear. It can be expanded and explained in several different ways.

The first word that needs to be clarified is "Why". This interrogative asks for a reason, but reasons are understood in different ways. Some philosophers suggest that all reasons are self-interested. Then the question "Why be moral?" asks "Why is it in my interest to be moral?" Others, in contrast, argue that some reasons concern effects on others (rather than oneself) or do not concern any effects on anyone. Then the question "Why be moral?" is not just asking why it is in my interest to be moral. Instead, it asks what, if anything, makes it irrational to be immoral or at least keeps it from being irrational to be moral.

The next clarification concerns the phrase "be moral". The question "Why be moral?" might seem to ask, "Why should I be a moral person?" This should be distinguished from the question, "Why should I do moral acts?", if there can be isolated cases where I have no reason not to do a particular immoral act (such as hurting this friend or cheating on this exam) while I still have reason not to want a wider tendency to do immoral acts (such as hurting and cheating regularly). Only such wider tendencies or character traits make someone immoral as a person, but it seems harder to imagine how there could be no reason to avoid such widespread tendencies. If immoral tendencies always directly or indirectly hurt other people, and if some reasons are facts about interests of other people, then there will always be reason not to be an immoral person. Even if reasons are restricted to self-interest, widespread tendencies to immorality might always be dangerous to the agent's self-interest, and then, again, there will always be reason not to be an immoral person. Practical moral skeptics might try to describe cases where a widespread tendency to immorality is in one's self-interest, but critics will respond by calling such cases unrealistic. Whether or not a realistic example can be found, the focus on immoral people or character traits at least makes it easier to argue that real agents always have some reason to be moral people.

The other question, "Why should I do moral acts?", can still be interpreted in different ways, including "Why should I do acts that are morally good?" or "Why should I do acts that are morally required?" These questions are distinct if some acts, such as giving to a particular charity, are morally good but not morally required. If I have no reason to do such an act, then I do not always have a reason to do what is morally good, but I still might always have a reason to do what is morally required. For simplicity, the rest of this entry will focus on practical moral skepticism about what is morally required.

What such practical moral skeptics deny is that I always have reason to do what is morally required. In other words, they deny that I always have reason not to do what is morally wrong. These claims are

equivalent because it is morally wrong not to do what is morally required. Practical moral skeptics do not deny that there is *sometimes* reason not do what is morally wrong. After all, some wrongdoers are caught and punished. However, practical moral skeptics can still deny that there is *always* reason to do what is morally required or to avoid what is morally wrong.

How much reason? Some practical moral skeptics claim that sometimes there is no reason at all to do what is morally required. If all reasons are self-interested, this means that sometimes doing what is morally required does not serve the agent's interest in any way. That extreme position would be refuted if doing what is morally wrong always creates even a slight risk of some negative repercussion. A more plausible and common version of practical moral skepticism denies, instead, that there is always an adequate (or non-overridden) reason to do what is morally required. To establish this position, practical moral skeptics need only one case where there is overriding reason not to do what is morally required.

It is not hard to imagine such a case if reasons are restricted to self-interest. Just consider an agent who would receive great satisfaction from killing another person whom he hates and whom he can kill without cost because he will die soon anyway. Killing then serves that agent's self-interest, even if it is still morally wrong. Other cases would work as well. If overall self-interest ever conflicts with moral requirements, then there will be overriding reason not to do what is morally required, on the assumption that all reasons are self-interested.

Without that assumption, such practical moral skepticism becomes much less plausible. If harms to others give agents reasons for and against actions, then this agent has some reason not to kill the victim. If that reason overrides the agent's reason to kill, then the agent will not have an adequate reason to kill. Of course, the agent's reason not to kill might also not be overriding. The reasons might be equal or incomparable in some way, in which case each is adequate, but neither is overriding.

This position is closely related to the claim that, when self-interest conflicts with moral requirements, neither alternative is irrational. If so, it is not always irrational to do what is morally wrong, but it still might never be irrational to do what is morally required. (Cf. Sidgwick 1966.) It does not matter much whether this position is classified as a version of practical moral skepticism. It is skeptical insofar as it denies that immoral actions are always irrational. It is anti-skeptical insofar as it claims that moral actions are never irrational.

Common Knowledge

A proposition *A* is *mutual knowledge* among a set of agents if each agent knows that *A*. Mutual knowledge by itself implies nothing about what, if any, knowledge anyone attributes to anyone else. Suppose each student arrives for a class meeting knowing that the instructor will be late. That the instructor will be late is mutual knowledge, but each student might think only she knows the instructor will be late. However, if one of the students says openly "Peter told me he will be late again," then each student knows that each student knows that the instructor will be late, each student knows that each student knows that each student knows that the instructor will be late, and so on, *ad infinitum.* The announcement made the mutually known fact *common knowledge* among the students.

Common knowledge is a phenomenon which underwrites much of social life. In order to communicate or otherwise coordinate their behavior successfully, individuals typically require mutual or common understandings or background knowledge. Indeed, if a particular interaction results in "failure", the usual explanation for this is that the agents involved did not have the common knowledge that would have resulted in success. If a married couple are separated in a department store, they stand a good chance of finding one another because their common knowledge of each others' tastes and experiences leads them each to look for the other in a part of the store both know that both would tend to frequent. Since the spouses both love cappuccino, each expects the other to go to the coffee bar, and they find one another. But in a less happy case, if a pedestrian causes a minor traffic jam by crossing against a red light, she explains her mistake as the result of her not noticing, and therefore not knowing, the status of the traffic signal that all the motorists knew. The spouses coordinate successfully given their common knowledge, while the pedestrian and the motorists miscoordinate as the result of a breakdown in common knowledge.

Given the importance of common knowledge in social interactions, it is remarkable that only quite recently have philosophers and social scientists attempted to analyze the concept. David Hume (1740) was perhaps the first to make explicit reference to the role of mutual knowledge in coordination. In his account of convention in *A Treatise of Human Nature,* Hume argued that a necessary condition for coordinated activity was that agents all know what behavior to expect from one another. Without the requisite mutual knowledge, Hume maintained, mutually beneficial social conventions would disappear. Much later, J. E. Littlewood (1953) presented some examples of common-knowledge-type reasoning, and Thomas Schelling (1960) and John Harsanyi (1967-1968) argued that something like common knowledge is needed to explain certain inferences people make about each other. Yet it was David Lewis (1969) who first gave an explicit analysis of common knowledge in the monograph *Convention.* Stephen Schiffer (1972), Robert Aumann (1976), and Gilbert Harman (1977) independently gave alternate definitions of common knowledge. Jon Barwise (1988, 1989) gave a precise formulation of Harman's intuitive account.

Schiffer's analysis of common knowledge as a *hierarchy* of epistemic claims has become standard in the philosophical and social science literature. Lewis', Aumann's, and Barwise's accounts all imply the hierarchical account. In some contexts, Schiffer's, Aumann's, and Barwise's definitions of common knowledge are more convenient to use than Lewis' original definition. More recently, Margaret Gilbert (1989) proposed a somewhat different account of common knowledge which she argues is preferable to the standard account. Others have developed accounts of mutual knowledge, *approximate common knowledge*, and *common belief* which require less stringent assumptions than the standard account, and which serve as more plausible models of what agents know in cases where strict common knowledge seems impossible (Brandenburger and Dekel 1987, Stinchcombe 1988, Monderer and Samet 1989, Rubinstein 1992). The analysis and applications of common knowledge and related multi-agent knowledge concepts has become a lively field of research.

The purpose of this essay is to overview of some of the most important results stemming from this contemporary research. The topics reviewed in each section of this essay are as follows: Section 1 gives motivating examples which illustrate a variety of ways in which the actions of agents depend crucially upon their having, or lacking, certain common knowledge. Section 2 discusses alternative analyses of common knowledge. Section 3 reviews applications of multi-agent knowledge concepts, particularly to *game theory* (von Neumann and Morgenstern 1944), in which common knowledge assumptions have been found to have great importance in justifying *solution concepts* for mathematical games. Section 4 discusses skeptical doubts about the attainability of common knowledge. Finally, Section 5 discusses the *common belief* concept which result from weakening the assumptions of Lewis' account of common knowledge.

---

1. Motivating Examples

Most of the examples in this section are familiar in the common knowledge literature, although some of the details and interpretations presented here are new. Readers may want to ask themselves what, if any, distinctive aspects of mutual and common knowledge reasoning each example illustrates.

1.1. The Clumsy Waiter[1]

A waiter serving dinner slips, and spills gravy on a guest's white silk evening gown. The guest glares at the waiter, and the waiter declares "I'm sorry. It was my fault." Why did the waiter say that he was at fault? He knew that he was at fault, and he knew from the guest's angry expression that she knew he was at fault. However, the sorry waiter wanted assurance that the guest *knew that he knew* he was at fault. By saying openly that he was at fault, the waiter knew that the guest knew what he wanted her to know, namely, that he knew he was at fault. Note that the waiter's declaration established at least three levels of nested knowledge.

Certain assumptions are implicit in the preceding story. In particular, the waiter must know that the guest knows he has spoken the truth, and that she can draw the desired conclusion from what he says in this context. More fundamentally, the waiter must know that if he announces "It was my fault" to the guest, she will interpret his intended meaning correctly and will infer what his making this announcement ordinarily implies in this context. This in turn implies that the guest must know that if the waiter announces "It was my fault" in this context, then the waiter indeed knows he is at fault. Then on account of his announcement, the waiter knows that the guest knows that he knows he was at fault. The waiter's announcement was meant to generate *higher-order* levels of knowledge of a fact each already knew.

Just a slight strengthening of the stated assumptions results in even higher levels of nested knowledge. Suppose the waiter and the guest each know that the other can infer what he infers from the waiter's announcement. Can the guest now believe that the waiter does not know that she knows that he knows he is at fault? If the guest considers this question, she reasons that if the waiter falsely believes it is possible that she does not know that he knows he is at fault, then the waiter must believe it to be possible that she

cannot infer that he knows he is at fault from his own declaration. Since she knows she *can* infer that the waiter knows he is at fault from his declaration, she knows that the waiter knows she can infer this, as well. Hence the waiter's announcement establishes the fourth-order knowledge claim: The guest knows that the waiter knows that she knows that he knows he is at fault. By similar, albeit lengthier, arguments, the agents can verify that corresponding knowledge claims of even higher-order must also obtain under these assumptions.

1.2 The Barbecue Problem

This is a variation of an example first published by Littlewood (1953), although he notes that his version of the example was already well-known at the time.[2] N individuals enjoy a picnic supper together which includes barbecued spareribs. At the end of the meal, $k \geq 1$ of these diners have barbecue sauce on their faces. No one wants to continue the evening with a messy face. No one wants to wipe her face if it's not messy, for this would make her appear neurotic. And no one wants to take the risk of being thought rude by telling anyone else that he has barbecue sauce on his face. Since no one can see her own face, none of the messy diners makes a move to clean her face. Then the cook who served the spareribs returns with a carton of ice cream. Amused by what he sees, the cook rings the dinner bell and makes the following announcement: "At least one of you has barbecue sauce on her face. I will ring the dinner bell over and over, until anyone who is messy has wiped her face. Then I will serve dessert." For the first $k - 1$ rings, no one does anything. Then, at the k^{th} ring, each of the messy individuals suddenly reaches for a napkin, and soon afterwards, the diners are all enjoying their ice cream.

How did the messy diners finally realize that their faces needed cleaning? The $k = 1$ case is easy, since in this case, the lone messy individual will realize he is messy immediately, since he sees that everyone else is clean. Consider the $k = 2$ case next. At the first ring, messy individual i_1 knows that one other person, i_2, is messy, but does not yet know about himself. At the second ring, i_1 realizes that he must be messy, since had i_2 been the only messy one, i_2 would have known this after the first ring when the cook made his announcement, and would have cleaned her face then. By a symmetric argument, messy diner i_2 also concludes that she is messy at the second ring, and both pick up a napkin at that time.

Let's next consider $k = 3$. Again at the first ring, each of the messy diners i_1, i_2, and i_3 knows the status of the other diners, but not her own. The situation is apparently unchanged after the second ring. But on the third ring, i_1 realizes that she is messy. For if i_2 and i_3 were the only messy ones, then they would have discovered this after the second ring by the argument of the previous paragraph. Since i_1 can see that all of the diners other than i_2 and i_3 are clean, she concludes that she must be messy. i_2 and i_3 draw similar conclusions at the third ring, and all clean their faces at that time.

The general case follows by induction. Suppose that if $k = j$, then each of the j messy diners can determine that he is messy after j rings. Then if $k = j + 1$, then at the $j + 1^{\text{st}}$ ring, each of the $j + 1$ individuals will realize that he is messy. For if he were not messy, then the other j messy ones would have all realized their messiness at the j^{th} ring and cleaned themselves then. Since no one cleaned herself after

the j^{th} ring, at the $j + 1^{st}$ ring each messy person will conclude that someone besides the other *j* messy people must also be messy, namely, himself.

The "paradox" of this argument is that for $k > 1$, like the case of the clumsy waiter of Example 1.1, the cook's announcement told the diners something that each already knew. Yet apparently the cook's announcement also gave the diners useful information. How could this be? By announcing a fact already known to every diner, the cook made this fact *common knowledge* among them, enabling each of them to eventually deduce the condition of his own face after sufficiently many rings of the bell. Note that the inductive argument the agents run through depends upon the conclusions they each draw from several *counterfactual conditionals.* In general, the consequences of agents' common knowledge are intimately related to how they evaluate subjunctive and counterfactual conditionals.[3]

1.3 The Farmer's Dilemma

Does meeting one's obligations to others serve one's self-interest? Plato and his successors recognized that in certain cases, the answer seems to be "No." Hobbes (1651, pp. 101-102) considers the challenge of a "Foole", who claims that it is irrational to honor an agreement made with another who has already fulfilled his part of the agreement. Noting that in this situation one has gained all the benefit of the other's compliance, the Foole contends that it would now be best for him to break the agreement, thereby saving himself the costs of compliance. Of course, if the Foole's analysis of the situation is correct, then would the other party to the agreement not anticipate the Foole's response to agreements honored, and act accordingly?

Hume (1740, pp. 520-521) takes up this question, using an example: Two neighboring farmers each expect a bumper crop of corn. Each will require his neighbor's help in harvesting his corn when it ripens, or else a substantial portion will rot in the field. Since their corn will ripen at different times, the two farmers can ensure full harvests for themselves by helping each other when their crops ripen, and both know this. Yet the farmers do not help each other. For the farmer whose corn ripens later reasons that if she were to help the other farmer, then when her corn ripens he would be in the position of Hobbes' Foole, having already benefited from her help. He would no longer have anything to gain from her, so he would not help her, sparing himself the hard labor of a second harvest. Since she cannot expect the other farmer to return her aid when the time comes, she will not help when his corn ripens first, and of course the other farmer does not help her when her corn ripens later.

The structure of Hume's *Farmers' Dilemma* problem can be summarized using the following tree diagram:

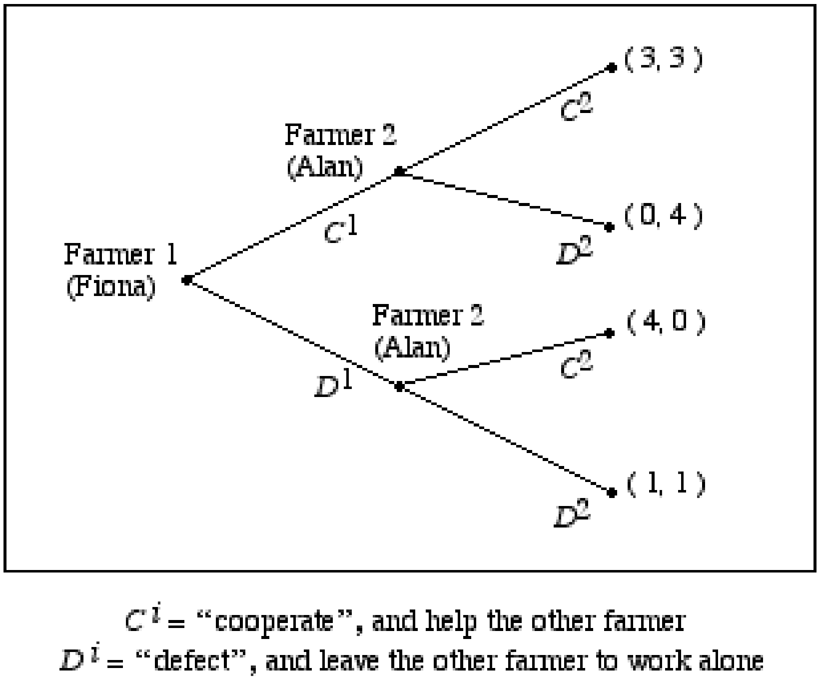

Figure 1.1a

This tree is an example of a *game in extensive form.* At each stage *i*, the agent who moves can either choose C^i, which corresponds to helping or *cooperating*, or D^i, which corresponds to not helping or *defecting*. The relative preferences of the two agents over the various outcomes are reflected by the ordered pairs of *payoffs* each receives at any particular outcome. If, for instance, Fiona chooses C^i and Alan chooses D^i, then Fiona's payoff is 0, her worst payoff, and Alan's is 4, his best payoff. In a game such as the Figure 1.1.a game, agents are *(Bayesian) rational* if each chooses an act that maximizes her expected payoff, given what she knows.

In the Farmers' Dilemma game, following the C^1,C^2-path is strictly better for both farmers than following the D^1,D^2-path. However, Fiona chooses D^1, as the result of the following simple argument: "If I were to choose C^1, then Alan, who is rational and who knows the payoff structure of the game, would choose D^2. I am also rational and know the payoff structure of the game. So I should choose D^1." Since Fiona knows that Alan is rational and knows the game's payoffs, she concludes that she need only analyze the *reduced* game in the following figure:

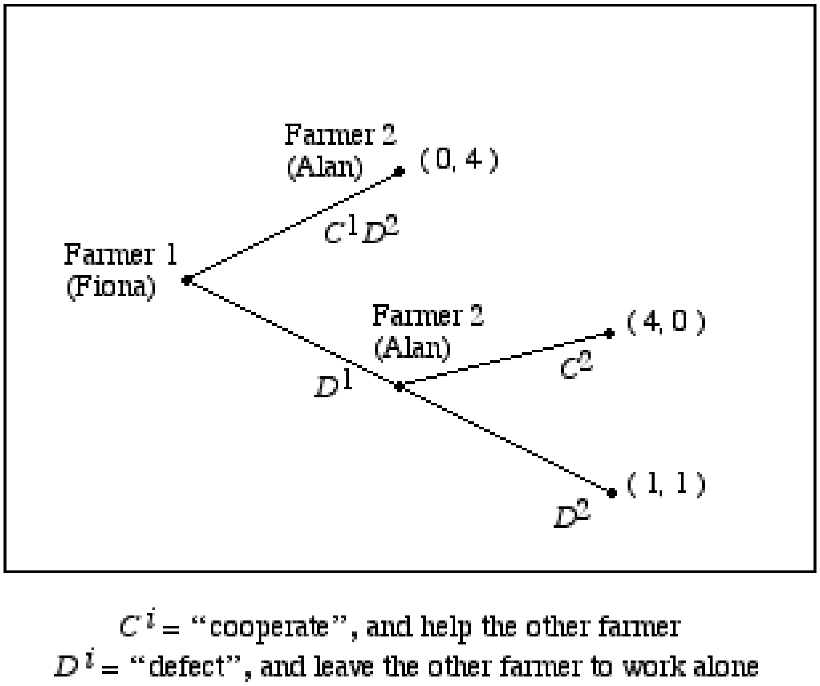

Figure 1.1b

In this reduced game, Fiona is certain to gain a strictly higher payoff by choosing D^1 than if she chooses C^1, so D^1 is her unique best choice. Of course, when Fiona chooses D^1, Alan, being rational, responds by choosing D^2. If Fiona and Alan know: (i) that they are both rational, (ii) that they both know the payoff structure of the game, and (iii) that they both know (i) and (ii), then they both can predict what the other will do at every node of the Figure 1.1.a game, and conclude that they can rule out the D^1,C^2-branch of the Figure 1.1.b game and analyze just the reduced game of the following figure:

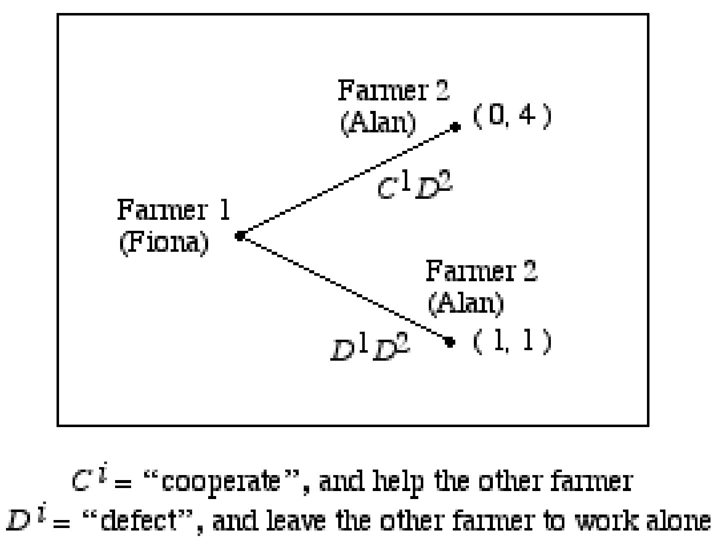

Figure 1.1c

On account of this *mutual knowledge*, both know that Fiona will choose D^1, and that Alan will respond with D^2. Hence, the D^1,D^2-outcome results if the Farmers' Dilemma game is played by agents having this

mutual knowledge, though it is suboptimal since both agents would fare better at the C^1,C^2-branch.[4] This argument, which in its essentials is Hume's argument, is an example of a standard technique for solving sequential games known as *backwards induction*.[5] The basic idea behind backwards induction is that the agents engaged in a sequential game deduce how each will act throughout the entire game by ruling out the acts that are not payoff-maximizing for the agents who would move last, then ruling out the acts that are not payoff-maximizing for the agents who would move next-to-last, and so on. Clearly, backwards induction arguments rely crucially upon what, if any, mutual knowledge the agents have regarding their situation, and they typically require the agents to evaluate the truth values of certain subjunctive conditionals, such as "If I (Fiona) were to choose C^1, then Alan would choose D^2".

1.4 The Centipede

The mutual knowledge assumptions required to construct a backwards induction solution to a game become more complex as the number of stages in the game increases. To see this, consider the sequential *Centipede* game depicted in the following figure:

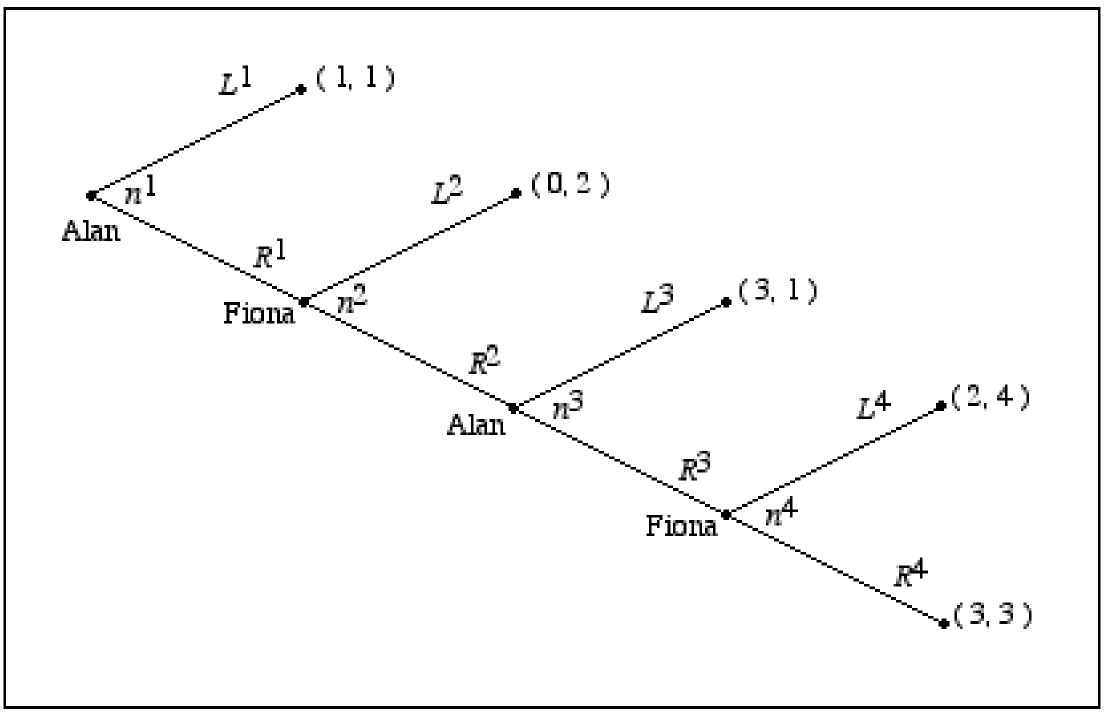

Figure 1.2

At each stage i, the agent who moves can either choose R^i, which in the first three stages gives the other agent an opportunity to move, or L^i, which ends the game.

Like the Farmers' Dilemma, this game is a commitment problem for the agents. If each agent could trust the other to choose R^i at each stage, then they would each expect to receive a payoff of 3. However, Alan chooses L^1, leaving each with a payoff of only 1, as the result of the following backwards induction argument: "If node n_4 were to be reached, then Fiona, (being rational) would choose L^4. I, knowing this,

would (being rational) choose L^3 if node n_3 were to be reached. Fiona, knowing *this*, would (being rational) choose L^2 if node n_2 were to be reached. Hence, I (being rational) should choose L^1." To carry out this backwards induction argument, Alan implicitly assumes that: (i) he knows that Fiona knows he is rational, and (ii) he knows that Fiona knows that he knows she is rational. Put another way, for Alan to carry out the backwards induction argument, at node n_1 he must know what Fiona must know at node n_2 to make L^2 her best response should n_2 be reached. While in the Farmer's Dilemma Fiona needed only *first-order* knowledge of Alan's rationality and *second-order* knowledge of Alan's knowledge of the game to derive the backwards induction solution, in the Figure 1.2 game, for Alan to be able to derive the backwards induction solution, the agents must have *third-order mutual knowledge* of the game and *second-order mutual knowledge* of rationality, and Alan must have *fourth-order* knowledge of this mutual knowledge of the game and *third-order* knowledge of their mutual knowledge of rationality. This argument also involves several counterfactuals, since to construct it the agents must be able to evaluate conditionals of the form, "If node n_i were to be reached, Alan (Fiona) would choose L^i (R^i)", which for $i > 1$ are counterfactual, since third-order mutual knowledge of rationality implies that nodes n_2, n_3, and n_4 are never reached.

The method of backwards induction can be applied to any sequential game of *perfect information*, in which the agents can observe each others' moves in turn and can recall the entire history of play. However, as the number of potential stages of play increases, the backwards induction argument evidently becomes harder to construct. This raises certain questions: (1) What precisely are the mutual or common knowledge assumptions that are required to justify the backwards induction argument for a particular sequential game? (2) As a sequential game increases in complexity, would we expect the mutual knowledge that is required for backwards induction to start to fail?

1.5 The Department Store

> When a man loses his wife in a department store without any prior understanding on where to meet if they get separated, the chances are good that they will find each other. It is likely that each will think of some obvious place to meet, so obvious that each will be sure that it is "obvious" to both of them. One does not simply predict where the other will go, which is wherever the first predicts the second to predict the first to go, and so *ad infinitum.* Not "What would I do if I were she?" but "What would I do if I were she wondering what she would do if she were wondering what I would do if I were she . . . ?"
>
> Thomas Schelling, *The Strategy of Conflict*

Schelling's department store problem is an example of a *pure coordination problem*, that is, an interaction problem in which the interests of the agents coincide perfectly. Schelling (1960) and Lewis (1969), who were the first to make explicit the role common knowledge plays in social coordination, were also among the first to argue that coordination problems can be modeled using the analytic vocabulary of game theory. A very simple example of such a coordination problem is given in the next figure:

Robert

Liz	s_1	s_2	s_3	s_4
s_1	(1, 1)	(0, 0)	(0, 0)	(0, 0)
s_2	(0, 0)	(1, 1)	(0, 0)	(0, 0)
s_3	(0, 0)	(0, 0)	(1, 1)	(0, 0)
s_4	(0, 0)	(0, 0)	(0, 0)	(1, 1)

s_i = search on floor i, $1 \leq i \leq 4$

Figure 1.3

The matrix of Figure 1.3 is an example of a *game in strategic form.* At each outcome of the game, which corresponds to a cell in the matrix, the row (column) agent receives as payoff the first (second) element of the ordered pair in the corresponding cell. However, in strategic form games, each agent chooses without first being able to observe the choices of any other agent, so that all must choose as if they were choosing simultaneously. The Figure 1.3 game is a game of *pure coordination* (Lewis 1969), that is, a game in which at each outcome, each agent receives exactly the same payoff. One interpretation of this game is that Schelling's spouses, Liz and Robert, are searching for each other in the department store with four floors, and they find each other if they go to the same floor. Four outcomes at which the spouses coordinate correspond to the strategy profiles (s_j, s_j), $1 \leq j \leq 4$, of the Figure 1.3 game. These four profiles are strict *Nash equilibria* (Nash 1950, 1951) of the game, that is, each agent has a decisive reason to follow her end of one of these strategy profiles provided that the other also follows this profile.[6]

The difficulty the agents face is trying to select an equilibrium to follow. For suppose that Robert hopes to coordinate with Liz on a particular equilibrium of the game, say (s_2, s_2). Robert reasons as follows: "Since there are several strict equilibria we might follow, I should follow my end of (s_2, s_2) if, and only if, I have sufficiently high expectations that Liz will follow her end of (s_2, s_2). But I can only have sufficiently high expectations that Liz will follow (s_2, s_2) if she has sufficiently high expectations that I will follow (s_2, s_2). For her to have such expectations, Liz must have sufficiently high (second-order) expectations that I have sufficiently high expectations that she will follow (s_2, s_2), for if Liz doesn't have these (second-order) expectations, then she will believe I don't have sufficient reason to follow (s_2, s_2) and may therefore deviate from (s_2, s_2) herself. So I need to have sufficiently high (third-order) expectations that Liz has sufficiently high (second-order) expectations that I have sufficiently high expectations that she will follow (s_2, s_2). But this implies that Liz must have sufficiently high (fourth-order) expectations that I have sufficiently high (third-order) expectations that Liz has sufficiently high

(second-order) expectations that I have sufficiently high expectations that she will follow (s_2, s_2), for if she doesn't, then she will believe I don't have sufficient reason to follow (s_2, s_2), and then she won't, either. Which involves me in fifth-order expectations regarding Liz, which involves her in sixth-order expectations regarding me, and so on." What would suffice for Robert, and Liz, to have decisive reason to follow (s_2, s_2) is that they each *know* that the other *knows* that . . . that the other will follow (s_2, s_2) for any number of levels of knowledge, which is to say that between Liz and Robert it is common knowledge that they will follow (s_2, s_2). If agents follow a strict equilibrium in a pure coordination game as a consequence of their having common knowledge of the game, their rationality and their intentions to follow this equilibrium, and no other, then the agents are said to be following a *Lewis-convention* (Lewis 1969).

Lewis' theory of convention applies to a more general class of games than pure coordination games, but pure coordination games already model a variety of important social interactions. In particular, Lewis models conventions of language as equilibrium points of a pure coordination game. The role common knowledge plays in games of pure coordination sketched above of course raises further questions: (1) Can people ever attain the common knowledge which characterizes a Lewis-convention? (2) Would less stringent epistemic assumptions suffice to justify Nash equilibrium behavior in a coordination problem?

2. Alternative Accounts of Common Knowledge

Informally, a proposition *A* is *mutually known* among a set of agents if each agent knows that *A*. Mutual knowledge by itself implies nothing about what, if any, knowledge anyone attributes to anyone else. Suppose each student arrives for a class meeting knowing that the instructor will be late. That the instructor will be late is mutual knowledge, but each student might think only she knows the instructor will be late. However, if one of the students says openly "Peter told me he will be late again," then the mutally known fact is now *commonly known.* Each student now knows that the instructor will be late, and so on, *ad infinitum.* The agents have common knowledge in the sense articulated informally by Schelling (1960), and more precisely by Lewis (1969) and Schiffer (1972). Schiffer uses the formal vocabulary of *epistemic logic* (Hintikka 1962) to state his definition of common knowledge. Schiffer's general approach was to augment a system of sentential logic with a set of knowledge operators corresponding to a set of agents, and then to define common knowledge as a hierarchy of propositions in the augmented system. Bacharach (1992) and Bicchieri (1993) adopt this approach, and develop logical theories of common knowledge which include soundness and completeness theorems. One can also develop alternate formal accounts of common knowledge in set-theoretic terms, which is the approach taken in this article.[7]

2.1 The Hierarchical Account

Monderer and Samet (1988) and Binmore and Brandenburger (1989) give a particularly elegant set-theoretic definition of common knowledge. I will review this definition here, and then show that it is logically equivalent to the '*i* knows that *j* knows that … *k* knows that A' hierarchy that Lewis (1969) and Schiffer (1972) argue characterizes common knowledge.[8]

Some preliminary notions must be stated first. Following C. I. Lewis (1943-1944) and Carnap (1947), propositions are formally subsets of a set Ω of *state descriptions* or *possible worlds.* One can think of the elements of Ω as representing Leibniz's possible worlds or Wittgenstein's possible states of affairs. Some results in the common knowledge literature presuppose that Ω is of finite cardinality. If this admittedly unrealistic assumption is needed in any context, this will be explicitly stated in this essay, and otherwise one may assume that Ω may be either a finite or an infinite set. A distinguished actual world ω_α is an element of Ω. A proposition $A \subseteq \Omega$ obtains (or is true) if the actual world $\omega_\alpha \in A$. In general, we say that *A obtains at* a world $\omega \in \Omega$ if $\omega \in A$. What an agent *i* knows about the possible worlds is stated formally in terms of a *knowledge operator* $\mathbf{K}_i$. Given a proposition $A \subseteq \Omega$, $\mathbf{K}_i(A)$ denotes a new proposition, corresponding to the set of possible worlds at which agent *i* knows that A obtains. $\mathbf{K}_i(A)$ is read as '*i* knows (that) *A* (is the case)'. The knowledge operator $\mathbf{K}_i$ satisfies certain axioms, including:

K1: $\mathbf{K}_i(A) \subseteq A$

K2: $\Omega \subseteq \mathbf{K}_i(\Omega)$

K3: $\mathbf{K}_i(\bigcap_k A_k) = \bigcap_k \mathbf{K}_i(A_k)$

K4: $\mathbf{K}_i(A) \subseteq \mathbf{K}_i\mathbf{K}_i(A)$[9]

In words, K1 says that if *i* knows *A*, then *A* must be the case. K2 says that *i* knows that some possible world in Ω occurs no matter which possible world ω occurs. K3 says that *i* knows a conjunction if, and only if, *i* knows each conjunct. K4 is a *reflection axiom*, which says that if *i* knows *A*, then *i* knows that she knows *A*. Note that by K3, if $A \subseteq B$ then $\mathbf{K}_i(A) \subseteq \mathbf{K}_i(B)$, by K1 and K2, $\mathbf{K}_i(\Omega) = \Omega$, and by K1 and K4, $\mathbf{K}_i(A) = \mathbf{K}_i\mathbf{K}_i(A)$. Any system of knowledge satisfying K1 - K4 corresponds to the modal system S4 (Kripke 1963). If one drops the K1 axiom and retains the others, the resulting system would give a formal account of what an agent *believes*, but does not necessarily *know.*

A useful notion in the formal analysis of knowledge is that of a *possibility set.* An agent i's possibility set at a state of the world Ω is the smallest set of possible worlds that *i* thinks could be the case if ω is the actual world. More precisely,

Definition 2.1
Agent *i*'s *possibility set* $\mathcal{H}_i(\omega)$ at $\omega \in \Omega$ is defined as

$$\mathcal{H}_i(\omega) \equiv \bigcap \{ E \mid \omega \in \mathbf{K}_i(E) \}$$

The collection of sets

$$\mathcal{H}_i = \bigcup_{\omega \in \Omega} \mathcal{H}_i(\omega)$$

is *i*'s *private information system.*

Since in words, $\mathcal{H}_i(\omega)$ is the intersection of all propositions which *i* knows at ω, $\mathcal{H}_i(\omega)$ is the smallest proposition in Ω that *i* knows at ω. Put another way, $\mathcal{H}_i(\omega)$ is the most specific information that *i* has about the possible world ω. The intuition behind assigning agents private information systems is that while an agent *i* may not be able to perceive or comprehend every last detail of the world in which *i* lives, *i* does know certain facts about that world. The elements of *i*'s information system represent what *i* knows immediately at a possible world. We also have the following:

Proposition 2.2
$\mathbf{K}_i(A) = \{ \omega \mid \mathcal{H}_i(\omega) \subseteq A \}$

In many formal analyses of knowledge in the literature, possibility sets are taken as primitive and Proposition 2.2 is given as the definition of knowledge. If one adopts this viewpoint, then the axioms K1 - K4 follow as consequences of the definition of knowledge. In many applications, the agents' possibility sets are assumed to *partition*[10] the set, in which case $\mathcal{H}_i$ is called i's *private information partition.*

To illustrate the idea of possibility sets, let us return to the Barbecue Problem described in Example 1.2. Suppose there are three diners: Cathy, Jennifer and Mark. Then there are 8 relevant states of the world, summarized by Table 2.1:

	ω_1	ω_2	ω_3	ω_4	ω_5	ω_6	ω_7	ω_8
Cathy	clean	messy	clean	clean	messy	messy	clean	messy
Jennifer	clean	clean	messy	clean	messy	clean	messy	messy
Mark	clean	clean	clean	messy	clean	messy	messy	messy

Table 2.1

Each diner knows the condition of the other diners' faces, but not her own. Suppose the cook makes no

announcement, after all. Then none of the diners knows the true state of the world whatever $\omega \in \Omega$ the actual world turns out to be, but they do know *a priori* that certain propositions are true at various states of the world. For instance, Cathy's information system before any announcement is made is depicted in Figure 2.1a:

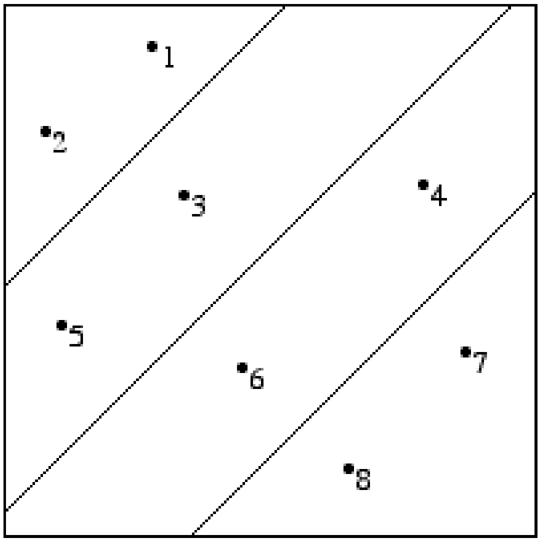

Figure 2.1a

In this case, Cathy's information system is a partition $\mathcal{H}_1$ of Ω defined by

$$\mathcal{H}_1 = \{H_{CC}, H_{CM}, H_{MC}, H_{MM}\}$$

where

$H_{CC} = \{\omega_1, \omega_2\}$ (i.e., Jennifer and Mark are both clean)

$H_{CM} = \{\omega_4, \omega_6\}$ (i.e., Jennifer is clean and Mark is messy)

$H_{MC} = \{\omega_3, \omega_5\}$ (i.e., Jennifer is messy and Mark is clean)

$H_{MM} = \{\omega_7, \omega_8\}$ (i.e., Jennifer and Mark are both messy)

Cathy knows immediately which cell $\mathcal{H}_1(\omega)$ in her partition is the case at any state of the world, but does not know which is the true state at any $\omega \in \Omega$.

If we add in the assumption stated in Example 1.2 that if there is at least one messy diner, then the cook announces the fact, then Cathy's information partition is depicted by Figure 2.1b:

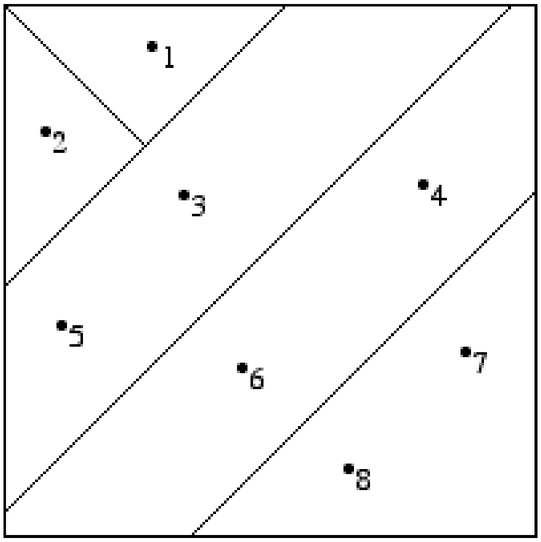

Figure 2.1b

In this case, Cathy's information system is a partition $\mathcal{H}_1$ of Ω defined by

$$\mathcal{H}_1 = \{H_{CCC}, H_{MCC}, H_{CM}, H_{MC}, H_{MM}\}$$

where

$H_{CCC} = \{\omega_1\}$ (i.e., Jennifer, Mark, and I are all clean)
$H_{MCC} = \{\omega_2\}$ (i.e., Jennifer and Mark are clean and I am messy)
$H_{CM} = \{\omega_4, \omega_6\}$ (i.e., Jennifer is clean and Mark is messy)
$H_{MC} = \{\omega_3, \omega_5\}$ (i.e., Jennifer is messy and Mark is clean)
$H_{MM} = \{\omega_7, \omega_8\}$ (i.e., Jennifer and Mark are both messy)

In this case, Cathy's information partition is a *refinement* of the partition she has when there is no announcement, for in this case, then Cathy knows *a priori* that if ω_1 is the case there will be no announcement and will know immediately that she is clean, and Cathy knows *a priori* that if ω_2 is the case, then she will know immediately from the cook's announcement that she is messy.

A slightly more complex case occurs if we alter the Barbecue problem so that the cook makes an announcement only if he sees at least two messy diners. Cathy's possibility set is now depicted by the diagram in Figure 2.1c:

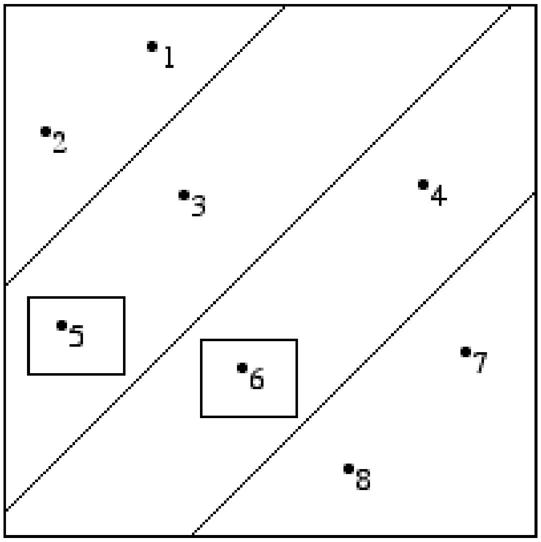

Figure 2.1c

This time, Cathy's information system does not partition Ω. For Cathy knows *a priori* that at ω_5, the cook will make his announcement, and since at ω_5 Jennifer is messy and Mark is clean, Cathy will realize immediately that she is messy. However, Cathy also knows *a priori* that at ω_3, either ω_3 or ω_5 could be the case, since at ω_3 she does not know in advance whether or not the cook will make an announcement. Hence $\mathcal{H}_1(\omega_5) = \{\omega_5\}$, but $\mathcal{H}_1(\omega_3) = \{\omega_3, \omega_5\}$. Similarly, $\mathcal{H}_1(\omega_6) = \{\omega_6\}$, but $\mathcal{H}_1(\omega_4) = \{\omega_4, \omega_6\}$. Jennifer's and Mark's information systems given any of the above three scenarios are derived similarly to Cathy's information system, and the details of this are left as an exercise for the reader.

We can now define mutual and common knowledge as follows:

Definition 2.3
Let a set Ω of possible worlds together with a set of agents N be given.

1. The proposition that A is *(first level* or *first order) mutual knowledge for the agents of N*, $\mathbf{K}^1_N(A)$, is the set defined by

$$\mathbf{K}^1_N(A) \equiv \bigcap_{i \in N} \mathbf{K}_i(A).$$

2. The proposition that A is m^{th} *level* (or m^{th} *order*) *mutual knowledge among the agents of N*, $\mathbf{K}^m_N(A)$, is defined recursively as the set

$$\mathbf{K}^m_N(A) \equiv \bigcap_{i \in N} \mathbf{K}_i(\mathbf{K}^{m-1}_N(A)).$$

3. The proposition that A is *common knowledge* among the agents of N, $\mathbf{K}^*_N(A)$, is defined as the set

$$\mathbf{K}^*_N(A) \equiv \bigcap_{m=1}^{\infty} \mathbf{K}^m_N(A).$$

As a consequence of Proposition 2.2, the agents' private information systems determine an *a priori* structure of propositions over the space of possible worlds regarding what they can know, including what mutual and common knowledge they potentially have. The world $\omega \in \Omega$ which obtains determines *a posteriori* what individual, mutual and common knowledge agents in fact have. Hence, one can read $\omega \in \mathbf{K}_i(A)$ as '*i* knows *A* at (possible world) ω', $\omega \in \mathbf{K}^m_N(A)$ as '*A* is m^{th} level mutual knowledge for the agents of *N* at ω', and so on. If ω obtains, then one can conclude that *i* does know *A*, that *A* is m^{th} level mutual knowledge, and so on. Common knowledge of a proposition *E* implies common knowledge of all that *E* implies, as is shown in the following:

> **Proposition 2.4**
> If $\omega \in \mathbf{K}^*_N(E)$ and $E \subseteq F$, then $\omega \in \mathbf{K}^*_N(F)$.
>
> Proof.

Note that $(\mathbf{K}^m_N(E))_{m \geq 1}$ is a decreasing sequence of events, in the sense that $\mathbf{K}^{m+1}_N(E) \subseteq \mathbf{K}^m_N(E)$, for all $m \geq 1$. It is also easy to check that if everyone knows *E*, then *E* must be true, that is, $\mathbf{K}^1_N(E) \subseteq E$. If Ω is assumed to be finite, then if *E* is common knowledge at ω, this implies that there must be a finite *m* such that

$$\mathbf{K}^m_N(E) = \bigcap_{n=1}^{\infty} \mathbf{K}^n_N(E).$$

The following result relates the set-theoretic definition of common knowledge to the hierarchy of '*i* knows that *j* knows that … knows *A*' statements.

> **Proposition 2.5**
> $\omega \in \mathbf{K}^m_N(A)$ iff
>
> (1) For all agents $i_1, i_2, \ldots, i_m \in N$, $\omega \in \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_m}(A)$
>
> Hence, $\omega \in \mathbf{K}^*_N(A)$ iff (1) is the case for each $m \geq 1$.
>
> Proof.

The condition that $\omega \in \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_m}(A)$ for all $m \geq 1$ and all $i_1, i_2, \ldots, i_m \in N$ is Schiffer's definition of common knowledge, and is often used as the definition of common knowledge in the literature.

2.2 Lewis' Account

Lewis is credited with the idea of characterizing common knowledge as a hierarchy of '*i* knows that *j* knows that … knows that *A*' propositions. However, it is far less well recognized that in *Convention*, Lewis also gives an algorithm which generates such a hierarchy from a finite set of assumptions regarding the agents' knowledge. These assumptions taken together constitute Lewis' official definition of common knowledge. Lewis' presentation of this definition is informal, and occasionally lacking in detail. It is probably for this reason that Aumann is often credited with presenting the first finitary method of generating the common knowledge hierarchy (Aumann 1976). A mathematically precise account of Lewis' analysis of common knowledge is given here, and it is shown that Lewis' analysis does result in the common knowledge hierarchy following from a finite set of axioms.

Lewis presents his account of common knowledge on pp. 52-57 of *Convention*. Lewis does not specify what account of knowledge is needed for common knowledge. As it turns out, Lewis' account is satisfactory for any formal account of knowledge in which the knowledge operators $\mathbf{K}_i$, $i \in N$, satisfy K1, K2, and K3. A crucial assumption in Lewis' analysis of common knowledge is that agents know they share the same "rationality, inductive standards and background information" (Lewis 1969, p. 53) with respect to a state of affairs A', that is, if an agent can draw any conclusion from A', she knows that all can do likewise. This idea is made precise in the following:

> **Definition 2.6**
> Given a set of agents N and a proposition $A' \subseteq \Omega$, the agents of N are *symmetric reasoners with respect to* A' (*or* A'*-symmetric reasoners*) iff, for each $i, j \in N$ and for any proposition $E \subseteq \Omega$, if $\mathbf{K}_i(A') \subseteq \mathbf{K}_i(E)$ and $\mathbf{K}_i(A') \subseteq \mathbf{K}_i\mathbf{K}_j(A')$, then $\mathbf{K}_i(A') \subseteq \mathbf{K}_i\mathbf{K}_j(E)$.[11]

The definiens says that for each agent *i*, if *i* can infer from A' that E is the case and that everyone knows that A' is the case, then *i* can also infer that everyone knows that E is the case.

> **Definition 2.7**
> A proposition E is *Lewis-common knowledge at* $\omega \in \Omega$ among the agents of a set $N = \{1, \ldots, n\}$ iff there is a proposition A^* such that $\omega \in A^*$, the agents of N are A^*-symmetric reasoners, and for every $i \in N$,
>
> L1: $\omega \in \mathbf{K}_i(A^*)$
>
> L2: $\mathbf{K}_i(A^*) \subseteq \mathbf{K}_i(\bigcap_{j \in N} \mathbf{K}_j(A^*))$

L3: $\mathbf{K}_i(A^*) \subseteq \mathbf{K}_i(E)$

> A^* is a *basis* for the agents' common knowledge. $\mathbf{L}^*_N(E)$ denotes the proposition defined by L1 - L3 for a set N of A^*-symmetric reasoners, so we can say that E is Lewis-common knowledge for the agents of N iff $\omega \in \mathbf{L}^*_N(E)$.

In words, L1 says that i knows A^* at ω. L2 says that if i knows that A^* obtains, then i knows that everyone knows that A^* obtains. This axiom is meant to capture the idea that common knowledge is based upon a proposition A^* that is *publicly known*, as is the case when agents hear a public announcement. If the agents' knowledge is represented by partitions, then a typical basis for the agents' common knowledge would be an element $\mathcal{M}(\omega)$ in the meet[12] of their partitions. L3 says that i can infer from A^* that E.

A human agent obviously cannot work her way mentally through an infinite mutual knowledge hierarchy. Lewis argues that this is not a problem for his analysis of common knowledge, since the mutual knowledge claims of a common knowledge hierarchy for a chain of logical consequences, not a series of steps in anyone's actual reasoning. Lewis uses an example to show how his definition of common knowledge generates the first few levels of mutual knowledge. In fact, Lewis' definition implies the entire common knowledge hierarchy, as is shown in the following result.

> **Proposition 2.8**
> $\mathbf{L}^*_N(E) \subseteq \mathbf{K}^*_N(E)$, that is, Lewis-common knowledge of E implies common knowledge of E.
>
> Proof.

2.3 Aumann's Account

Aumann (1976) gives a different characterization of common knowledge which gives another simple algorithm for determining what information is commonly known. Aumann's original account assumes that the each agent's possibility set forms a private information partition of the space Ω of possible worlds. Aumann shows that a proposition C is common knowledge if, and only if, C contains a cell of the meet of the agents' partitions. One way to compute the meet $\mathcal{M}$ of the partitions $\mathcal{H}_i$, $i \in N$ is to use the idea of "reachability".

> **Definition 2.9**
> A state $\omega' \in \Omega$ is *reachable* from $\omega \in \Omega$ iff there exists a sequence $\omega=\omega_0, \omega_1, \omega_2, \dots,$ $\omega_m=\omega'$ such that for each $k \in \{0,1, \dots, m-1\}$, there exists an agent $i_k \in N$ such that $\mathcal{H}_{i_k}(\omega_k) = \mathcal{H}_{i_k}(\omega_{k+1})$.

In words, ω' is reachable from ω if there exists a sequence or "chain" of states from ω to ω' such that two consecutive states are in the same cell of some agent's information partition. To illustrate the idea of reachability, let us return to the modified Barbecue Problem in which Cathy, Jennifer and Mark receive no announcement. Their information partitions are all depicted in Figure 2.1d:

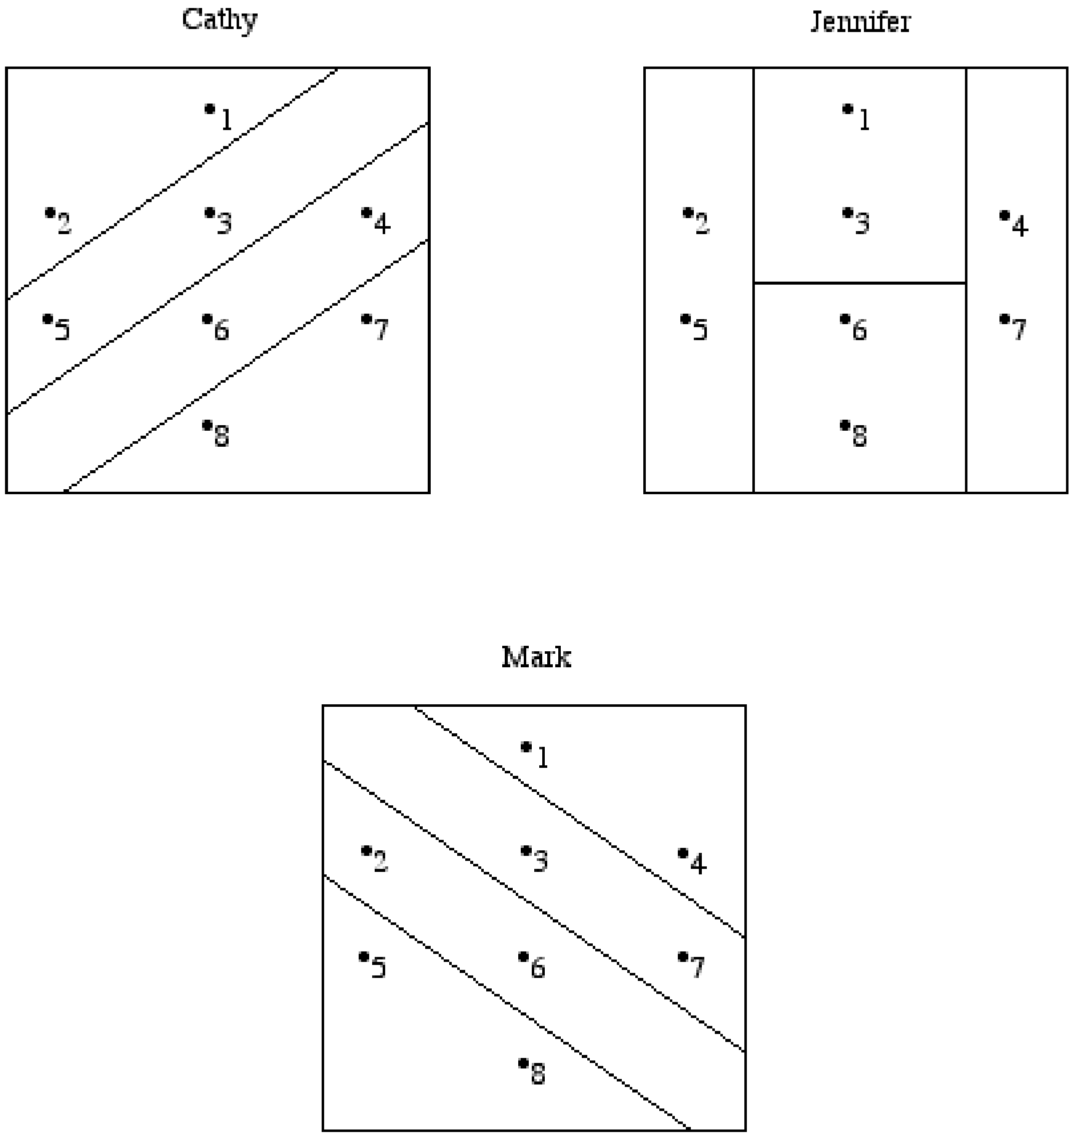

Figure 2.1d

One can understand the importance of the notion of reachability in the following way: If ω' is reachable from ω, then if ω obtains then some agent can reason that some other agent thinks that ω' is possible. Looking at Figure 2.1d, if $\omega = \omega_1$ occurs, then Cathy (who knows only that $\{\omega_1, \omega_2\}$ has occurred) knows that Jennifer thinks that ω_5 might have occurred (even though Cathy knows that ω_5 did not occur). So Cathy cannot rule out the possibility that Jennifer thinks that Mark thinks that that ω_8 might have occurred. And Cathy cannot rule out the possibility that Jennifer thinks that Mark thinks that Cathy believes that ω_7 is possible. In this sense, ω_7 is reachable from ω_1. The chain of states which establishes this is ω_1, ω_2, ω_5, ω_8, ω_7, since $\mathcal{H}_1(\omega_1) = \mathcal{H}_1(\omega_2)$, $\mathcal{H}_2(\omega_2) = \mathcal{H}_2(\omega_5)$, $\mathcal{H}_3(\omega_5) = \mathcal{H}_3(\omega_8)$, and $\mathcal{H}_1($

$\omega_8) = \mathcal{H}_1(\omega_7)$. Note that one can show similarly that in this example any state is reachable from any other state. This example also illustrates the following immediate result:

Proposition 2.10
ω' is reachable from ω iff there is a sequence $i_1, i_2, \ldots, i_m \in N$ such that

$$(1)\ \omega' \in \mathcal{H}_{i_m}(\ \ldots (\mathcal{H}_{i_2}(\mathcal{H}_{i_1}(\omega))))$$

One can read (1) as: 'At ω, i_1 thinks that i_2 thinks that … , i_m thinks that ω' is possible.'

We now have:

Lemma 2.11
$\omega' \in \mathcal{M}(\omega)$ iff ω' is reachable from ω.

Proof.

and

Lemma 2.12.
$\mathcal{M}(\omega)$ is common knowledge for the agents of N at ω.

Proof.

and

Proposition 2.13 (Aumann 1976)
Let $\mathcal{M}$ be the meet of the agents' partitions $\mathcal{H}_i$ for each $i \in N$. A proposition $E \subseteq \Omega$ is common knowledge for the agents of N at ω iff $\mathcal{M}(\omega) \subseteq E$. (In Aumann (1976), E is *defined* to be common knowledge at ω iff $\mathcal{M}(\omega) \subseteq E$.)

Proof.

If $E = \mathbf{K}^1_N(E)$, then E is a *public event* (Milgrom 1981) or a *common truism* (Binmore and Brandenburger 1989). Clearly, a common truism is common knowledge whenever it occurs, since in this case $E = \mathbf{K}^1_N(E) = \mathbf{K}^2_N(E) = \ldots$, so $E = \mathbf{K}^*_N(E)$. The proof of Proposition 2.13 shows that the common truisms are precisely the elements of $\mathcal{M}$ and unions of elements of $\mathcal{M}$, so any commonly known event is the consequence of a common truism.

2.4 Barwise's Account

Barwise (1988) proposes another definition of common knowledge that avoids explicit reference to the hierarchy of '*i* knows that *j* knows that … knows that *A*' propositions. Barwise's analysis builds upon an informal proposal by Harman (1977). Consider the situation of the guest and clumsy waiter in Example 1 when he announces that he was at fault. They are now in a setting where they have heard the waiter's announcement and know that they are in the setting. Harman adopts the circularity in this characterization of the setting as fundamental, and propses a definition of common knowledge in terms of this circularity. Barwise's formal analysis gives a precise formulation of Harman's intuitive analysis of common knowledge as a *fixed point*. Given a function *f*, *A* is a fixed point of *f* if *f(A)=A*. Now note that

$$\begin{aligned}
\mathbf{K}^1_N\left(E \cap \bigcap_{m=1}^{\infty} \mathbf{K}^m_N(E)\right) &= \mathbf{K}^1_N(E) \cap \mathbf{K}^1_N\left(\bigcap_{m=1}^{\infty} \mathbf{K}^m_N(E)\right) \\
&= \mathbf{K}^1_N(E) \cap \left(\bigcap_{m=1}^{\infty} \mathbf{K}^1_N(\mathbf{K}^m_N(E))\right) \\
&= \mathbf{K}^1_N(E) \cap \left(\bigcap_{m=2}^{\infty} \mathbf{K}^m_N(E)\right) \\
&= \bigcap_{m=1}^{\infty} \mathbf{K}^m_N(E)
\end{aligned}$$

So we have established that $\mathbf{K}^*_N(E)$ is a fixed point of the function f_E defined by $f_E(X) = \mathbf{K}^1_N(E \cap X)$. f_E has other fixed points. For instance, any contradiction $B \cap B^c = \varnothing$ is a fixed point of f_E.[13] Note also that if $A \subseteq B$, then $E \cap A \subseteq E \cap B$ and so

$$f_E(A) = \mathbf{K}^1_N(E \cap A) \subseteq \mathbf{K}^1_N(E \cap B) = f_E(B)$$

that is, f_E is *monotone*. (We saw that $\mathbf{K}^1_N$ is also monotone in the proof of Proposition 2.4.) Barwise's analysis of common knowledge can be developed using the following result from set theory:

> **Proposition**
> A monotone function *f* has a unique fixed point *C* such that if *B* is a fixed point of *f*, then $B \subseteq C$. *C* is the *greatest fixed point of f.*

This proposition establishes that f_E has a greatest fixed point, which characterizes common knowledge in Barwise's account. As Barwise himself observes, the fixed point analysis of common knowledge is closely related to Aumann's partition account. This is easy to see when one compares the fixed point

analysis to the notion of common truisms that Aumann's account generates. Some authors regard the fixed point analysis as an alternate formulation of Aumann's analysis. Barwise's fixed point analysis of common knowledge is favored by those who are especially interested in the applications of common knowledge to problems in logic, while the hierarchical and the partition accounts are favored by those who wish to apply common knowledge in social philosophy and social science. When knowledge operators satisfy the axioms (K1)-(K4), the Barwise account of common knowledge is equivalent to the hierarchical account.

Proposition 2.14
Let C^*_N be the greatest fixed point of f_E. Then $C^*_N(E) = K^*_N(E)$. (In Barwise (1988, 1989), E is *defined* to be common knowledge at ω iff $\omega \in C^*_N(E)$.)

Proof.

Barwise argues that in fact the fixed point analysis is more flexible and consequently more general than the hierachical account. This may surprise readers in light of Proposition 2.14, which shows that Barwise's fixed point definition is *equivalent* to the hierarchical account. Indeed, while Barwise (1988, 1989) proves a result showing that the fixed point account implies the hierarchical account and gives examples that satisfy the common knowledge hierarchy but fail to be fixed points, a number of authors who have written after Barwise have given various proofs of the equivalence of the two definitions, as was shown in Proposition 2.14. In fact, there is not a true controversy, at least with respect to the analytical results. Barwise's fixed point account is indeed equivalent to the hierarchical and the partition accounts given the account of knowledge characterized by (K1)-(K4) that most practitioners accept. Barwise does not make explicit which axioms of (K1)-(K4) he accepts, but he wishes to analyze a weaker notion of knowledge that is not closed under logical implication, and so he is committed to rejecting (K3). By doing so, Barwise is able to prove the nonequivalence between the fixed point and the hierarchical account he claims. But Barwise's result comes at a price most analysts are not willing to pay. To formulate his results given his very weak conception of knowledge, Barwise must use *non-well-founded set theory* (Aczel 1988) in order to allow him to make the necessary circular definitions. As we have seen in this section, when one adopts the conventional analysis of knowledge that satisfies (K1)-(K4), the equivalence of the hierarchical and the fixed point accounts follows without the need to introduce non-well-founded set-theoretic concepts.

2.5 Gilbert's Account

Gilbert (1989, Chapter 3) presents an alternative account of common knowledge, which is meant to be more intuitively plausible than Lewis' and Aumann's accounts. Gilbert gives a highly detailed description of the circumstances under which agents have common knowledge.

Definition 2.15
A set of agents N are in a *common knowledge situation* $\mathcal{S}(A)$ with respect to a proposition A if, and only if, $\omega \in A$ and for each $i \in N$,

G_1: *i* is *epistemically normal*, in the sense that *i* has normal perceptual organs which are functioning normally and has normal reasoning capacity.[14]

G_2: *i* has the concepts needed to fulfill the other conditions.

G_3: *i* perceives the other agents of *N*.

G_4: *i* perceives that G_1 and G_2 are the case.

G_5: *i* perceives that the state of affairs described by *A* is the case.

G_6: *i* perceives that all the agents of *N* perceive that *A* is the case.

Gilbert's definition appears to contain some redundancy, since presumably an agent would not perceive A unless A is the case. Gilbert is evidently trying to give a more explicit account of single agent knowledge than Lewis and Aumann give. For Gilbert, agent *i* knows that a proposition *E* is the case if, and only if, $\omega \in E$, that is, *E* is true, and either *i* perceives that the state of affairs *E* describes obtains or *i* can infer *E* as a consequence of other propositions *i* knows, given sufficient inferential capacity.

Like Lewis, Gilbert recognizes that human agents do not in fact have unlimited inferential capacity. To generate the infinite hierarchy of mutual knowledge, Gilbert introduces the device of an agent's *smooth-reasoner counterpart.* The smooth-reasoner counterpart i' of an agent *i* is an agent that draws every logical conclusion from every fact that *i* knows. Gilbert stipulates that i' does not have any of the constrains on time, memory, or reasoning ability that *i* might have, so i' can literally think through the infinitely many levels of a common knowledge hierarchy.

Definition 2.16
If a set of agents *N* are in a common knowledge situation $\mathcal{S}_N(A)$ with respect to *A*, then the corresponding set N' of their smooth-reasoner counterparts is in a *parallel situation* $\mathcal{S}'_{N'}(A)$ if, and only if, for each $i' \in N$,

G_1': i' can perceive anything that the counterpart *i* can perceive.

G_2': G_2 - G_6 obtain for i' with respect to *A* and N', same as for the counterpart *i* with respect to *A* and *N*.

G_3': i' perceives that all the agents of N' are smooth-reasoners.

From this definition we get the following immediate consequence:

Proposition 2.17
If a set of smooth-reasoner counterparts to a set *N* of agents are in a situation $\mathcal{S}'_{N'}(A)$ parallel to a common knowledge situation $\mathcal{S}_N(A)$ of *N*, then

$$\text{for all } m \in \mathbb{N} \text{ and for any } i_1', \ldots, i_m',\ \mathbf{K}_{i_1'}\mathbf{K}_{i_2'}\ldots\mathbf{K}_{i_m'}(A).$$

Consequently, $\mathbf{K}^m_N{}'(A)$ for any $m \in \mathbb{N}$.

Gilbert argues that, given $\mathcal{S}'_N{}'(A)$, the smooth-reasoner counterparts of the agents of N actually satisfy a much stronger condition, namely mutual knowledge $\mathbf{K}^{\alpha}_N{}'(A)$ to the level of any ordinal number α, finite or infinite. When this stronger condition is satisfied, the proposition A is said to be *open* to the agents of N*. With the concept of open*-ness, Gilbert gives her definition of common knowledge.

Definition 2.18
A proposition $E \subseteq \Omega$ is *Gilbert-common knowledge* among the agents of a set $N = \{1, \ldots, n\}$, if and only if,

G_1*: E is open* to the agents of N.

G_2*: For every $i \in N$, $\mathbf{K}_i(G_1^*)$.

$\mathbf{G}_N^*(E)$ denotes the proposition defined by G_1* and G_2* for a set N of A*-symmetric reasoners, so we can say that E is Lewis-common knowledge for the agents of N iff $\omega \in \mathbf{G}_N^*(E)$.

One might think that an immediate corollary to Gilbert's definition is that Gilbert-common knowledge implies the hierarchical common knowledge of Proposition 2.5. However, this claim follows only on the assumption that an agent knows all of the propositions that her smooth-reasoner counterpart reasons through. Gilbert does not explicitly endorse this position, although she correctly observes that Lewis and Aumann are committed to something like it.[15] Gilbert maintains that her account of common knowledge expresses our intuitions with respect to common knowledge better than Lewis' and Aumann's accounts, since the notion of open*-ness presumably makes explicit that when a proposition is common knowledge, it is "out in the open", so to speak.

3. Applications of Mutual and Common Knowledge

Readers primarily interested in philosophical applications of common knowledge may want to focus on the No Disagreement Theorem and Convention subsections. Readers interested in applications of common knowledge in game theory may continue with the Strategic Form Games, and Games of Perfect Information subsections.

3.1 The "No Disagreement" Theorem

Aumann (1976) originally used his definition of common knowledge to prove a celebrated result that says that in a certain sense, agents cannot "agree to disagree" about their beliefs, formalized as probability distributions, if they start with common prior beliefs. Since agents in a community often hold different opinions and know they do so, one might attribute such differences to the agents' having different private information. Aumann's surprising result is that even if agents condition their beliefs on private information, mere common knowledge of their conditioned beliefs and a common prior probability distribution implies that their beliefs cannot be different, after all!

Proposition 3.1
Let Ω be a finite set of states of the world. Suppose that

- Agents i and j have a common prior probability distribution $\mu(\cdot)$ over the events of Ω such that $\mu(\omega) > 0$, for each $\omega \in \Omega$, and
- It is common knowledge at ω that i's posterior probability of event E is $q_i(E)$ and that j's posterior probability of E is $q_j(E)$.

Then $q_i(E) = q_j(E)$.

Proof.
[Note that in the proof of this proposition, and in the sequel, $\mu(\cdot|B)$ denotes conditional probability; that is, given $\mu(B)>0$, $\mu(A|B) = \mu(A\cap B)/\mu(B)$.]

In a later article, Aumann (1987) argues that the assumptions that Ω is finite and that $\mu(\omega) > 0$ for each $\omega \in \Omega$ reflect the idea that agents only regard as "really" possible a finite collection of salient worlds to which they assign positive probability, so that one can drop the states with probability 0 from the description of the state space. Aumann also notes that this result implicitly assumes that the agents have common knowledge of their partitions, since a description of each possible world includes a description of the agents' possibility sets. And of course, this result depends crucially upon (i), which is known as the *common prior assumption* (CPA).

Aumann's "no disagreement" theorem has been generalized in a number of ways in the literature (McKelvey and Page 1986, Monderer and Samet 1989, Geanakoplos 1994). However, all of these "no disagreement" results raise the same philosophical puzzle raised by Aumann's original result: How are we to explain differences in belief? Aumann's result leaves us with two options: (1) admit that at some level, common knowledge of the agents' beliefs or how they form their beliefs fails, or (2) deny the CPA. For instance, agents in the real world often do not express their opinions probabilistically. If one agent announces'I believe that E is the case' while another announces'I doubt that E is the case', then they might attribute their divergent opinions to a lack of common knowledge of each other's true posteriors for E. Even if agents do assign precise posterior probabilities to an event, Aumann shows that if they have

merely first-order mutual knowledge of the posteriors, they can "agree to disagree". Suppose the following all hold:

$\Omega = \{\omega_1, \omega_2, \omega_3, \omega_4\}$,
$\mathcal{H}_1 = \{\{\omega_1,\omega_2\}, \{\omega_3,\omega_4\}\}$
$\mathcal{H}_2 = \{\{\omega_1,\omega_2,\omega_3\}, \{\omega_4\}\}$
$\mu(\omega_i) = 1/4$

Then if $E = \{\omega_1,\omega_4\}$, then at ω_1, we have:

$q_1(E) = \mu(E \mid \{\omega_1,\omega_2\}) = 1/2$, and

$q_2(E) = \mu(E \mid \{\omega_1,\omega_2,\omega_3\}) = 1/3$

Moreover, at $\omega = \omega_1$, Agent 1 knows that $\mathcal{H}_2(\omega) = \{\omega_1,\omega_2,\omega_3\}$, so she knows that $q_2(E) = 1/3$. Agent 2 knows at ω_1 that either $\mathcal{H}_1(\omega) = \{\omega_1,\omega_2\}$ or $\mathcal{H}_1(\omega) = \{\omega_3,\omega_4\}$, so either way he knows that $q_1(E) = 1/2$. Hence the agents' posteriors are mutually known, and yet they are unequal. The reason for this is that the posteriors are not common knowledge. For Agent 2 does not know what Agent 1 thinks $q_2(E)$ is, since if $\omega = \omega_3$, which is consistent with what Agent 2 knows, then Agent 1 will believe that $q_2(E) = 1/3$ with probability 1/2 (if $\omega = \omega_3$) and $q_2(E) = 1$ with probability 1/2 (if $\omega = \omega_4$).

Aumann's result could fail if the agents' partitions are not common knowledge. For suppose in the example just given, the agents do not know each other's partitions. Then at $\omega = \omega_1$, if their posteriors are common knowledge, then Agent 1, who knows that $\omega \in \{\omega_1,\omega_2\}$, can explain Agent 2's posterior as the result of Agent 2 having observed either $\{\omega_1,\omega_2,\omega_3\}$, $\{\omega_1,\omega_2,\omega_4\}$, $\{\omega_1,\omega_3,\omega_4\}$ or $\{\omega_2,\omega_3,\omega_4\}$. Still another way Aumann's result might fail is if agents do not have common knowledge that they update their beliefs by Bayesian conditionalization. Then clearly, agents can explain divergent opinions as the result of others having modified their beliefs in the "wrong" way. However, there are cases in which none of these explanations will seem convincing. For instance, odds makers sometimes publicly announce different probabilities for an event, such as a particular winner of a prize at a forthcoming Academy Awards presentation, and they will know that none of them have *any* private information regarding the event. In cases such as this, the agents have common knowledge that they all have the same information structure and common knowledge of their posteriors. And knowing that they are all competent odds makers, they have common knowledge that they update by Bayesian conditionalization. Still, the odds makers' beliefs violate the conclusion of Aumann's result. More generally, denying the requisite common knowledge seems a rather *ad hoc* move. For instance, to deny that agents have common knowledge of information structures is simply to deny that agents can all infer the same conclusions regarding possible worlds as Aumann defines them. To deny that agents have common knowledge that they update their beliefs by Bayesian conditionalization is to assert that some believe that some might be updating their beliefs *incoherently*, in the sense that their belief updating leaves them open to a *Dutch book* (Skyrms

1984). As just noted, these failures of agents' beliefs in each others' competence do not fail in all cases. Why should one think that such failures of common knowledge provide a general explanation for divergent beliefs?

What of the second option, that is, denying the CPA?[16] The main argument put forward in favor of the CPA is that any differences in agents' probabilities should be the result of their having different information only, that is, there is no reason to think that the different beliefs that agents have regarding the same event are the result of anything other than their having different information. However, one can reply that this argument amounts simply to a restatement of the Harsanyi Doctrine.[17] And while defenders of the Harsanyi Doctrine may be right in thinking that there is apparently no compelling reason to think that agents' priors can be different, neither is there compelling reason to think they must be the same! In any event, while the controversy over the Harsanyi Doctrine remains unresolved, we can conclude that the "no disagreement" results have interesting implications for the viability of common knowledge and the very nature of probability. Defenders of the CPA take an *objectivist* view of probability, and by virtue of the "no disagreement" results are evidently committed to the view that common knowledge of agents beliefs and how they are formed is a rare phenomenon in the world. Those who are prepared to deny the CPA allow for a genuinely *subjectivist* conception of probability. They take the view that common knowledge of agents' beliefs and how they come by them can be a commonplace phenomenon, and that differences in opinion can stem from differences in (subjective) prior probabilities.

3.2 Convention

Schelling's Department Store problem of Example 1.5 is a very simple example in which the agents "solve" their coordination problem appropriately by establishing a *convention.* Using the vocabulary of game theory, Lewis (1969) defines a convention as a *strict coordination equilibrium* of a game which agents follow on account of their common knowledge that they all prefer to follow this coordination equilibrium. A coordination equilibrium of a game is a strategy combination such that no agent is better off if any agent unilaterally deviates from this combination. As with equilibria in general, a coordination equilibrium is *strict* if any agent who deviates unilaterally from the equilibrium is strictly worse off. The strategic form game of Figure 1.3 summarizes Liz's and Robert's situation. The Department Store game has four Nash equilibrium outcomes in pure strategies: (s_1, s_1), (s_2, s_2), (s_3, s_3), and (s_4, s_4).[18] These four equilibria are all strict coordination equilibria. If the agents follow either of these equilibria, then they coordinate successfully. For agents to be following a Lewis-convention in this situation, they must follow one of the game's coordination equilibria. However, for Lewis to follow a coordination equilibrium is not a sufficient condition for agents to be following a convention. For suppose that Liz and Robert fail to analyze their predicament properly at all, but Liz chooses s_2 and Robert chooses s_2, so that they coordinate at (s_2, s_2) by sheer luck. Lewis does not count accidental coordination of this sort as a convention.

Suppose next that both agents are Bayesian rational, and that part of what each agent knows is the payoff structure of the Intersection game. If the agents expect each other to follow (s_2, s_2) and they consequently coordinate successfully, are they then following a convention? Not necessarily, contends Lewis, in a

subtle argument on p. 59 of *Convention*. For while each knows the game and that she is rational, she might not attribute like knowledge to the other agent. If each agent believes that the other agent will follow her end of the (s_2, s_2) equilibrium mindlessly, then her best response is to follow her end of (s_2, s_2). But in this case the agents coordinated as the result of their each falsely believing that the other acts like an automaton, and Lewis thinks that any proper account of convention must require that agents have *correct* beliefs about one another. In particular, Lewis requires that each agent involved in a convention must have mutual expectations that each is acting with the aim of coordinating with the other, that is, that each knows that:

> A_1: Both are rational,
> A_2: Both know the payoff structure of the game, and
> A_3: Both intend to follow (s_2, s_2), and not some other strategy combination.

Suppose that the agents' beliefs are appropriately augmented so that each agent knows that A_1, A_2, and A_3 are the case. Again they coordinate on (s_2, s_2). Are they following a convention this time? Still not necessarily, says Lewis. For what if it turns out that Liz thinks that Robert does not know that they are both rational? Then Liz has a false belief about Robert. Beyond this, there are two other points which Lewis does not himself raise in this argument, but which clearly support his view. First, it would be counterintuitive, at the very least, to suppose that any agent following a convention believes that he has reasoning abilities that the other agents lack. If Liz has determined that A_1, A_2, and A_3 are the case, then if they are following a convention she should expect that Robert has arrived at the same conclusion. Second, what could explain Liz's knowledge of A_3? The most natural explanation for Liz's expectation that Robert will follow his end of (s_2, s_2) is that Liz knows that Robert knows that A_1, A_2, and A_3 are the case. So convention evidently involves agents having at least *second-order* mutual knowledge of A_1, A_2, and A_3, that is, Robert (Liz) must know that Liz (Robert) knows that A_1, A_2, and A_3 are the case. But this raises the question: Can *third-order* mutual knowledge that A_1, A_2, and A_3 obtain fail? No, argues Lewis. For if Robert thought that Liz did not know that Robert knew that A_1, A_2, and A_3 were the case, then Robert would have a false belief about Liz. The additional supporting points also kick in again: If Robert has second-order mutual knowledge that A_1, A_2, and A_3 obtain, then he should conclude that Liz also has this second-order mutual knowledge. To conclude otherwise would require Robert to assume, counterintuitively, that he has analyzed their deliberations in this situation in a way that Liz cannot. And how did Robert get his second-order mutual knowledge of A_3? The most obvious way to account for Robert's second-order mutual knowledge would be to attribute to Robert the knowledge that Liz has second-order mutual knowledge that A_1, A_2, and A_3 are the case. So convention requires third-order mutual knowledge that A_1, A_2, and A_3 are the case. And the argument can be continued for any higher level of mutual knowledge.

Lewis concludes that a necessary condition for agents to be following a convention is that their preferences to follow the corresponding coordination equilibrium be common knowledge. So on Lewis' account, a convention for a set of agents is a coordination equilibrium which the agents follow on account

of their common knowledge of their rationality, the payoff structure of the relevant game and that each agent follows her part of the equilibrium.

> A regularity R in the behavior of members of a population P when they are agents in a recurrent situation S is a *convention* if and only if it is true that, and it is common knowledge in P that, in any instance of S among the members of P,
>
> 1. everyone conforms to R;
> 2. everyone expects everyone else to conform to R;
> 3. everyone has approximately the same preferences regarding all possible combinations of actions;
> 4. everyone prefers that everyone conform to R, on condition that at least all but one conform to R;
> 5. everyone would prefer that everyone conform to R', on condition that at least all but one conform to R',
>
> where R' is some possible regularity in the behavior of members of P in S, such that no one in any instance of S among members of P could conform both to R' and to R.
> (Lewis 1969, p. 76)[19]

Lewis includes the requirement that there be an alternate coordination equilibrium R' besides the equilibrium R that all follow in order to capture the fundamental intuition that how the agents who follow a convention behave depends crucially upon how they expect the others to behave. In the Department Store game, the (s_2, s_2) equilibrium is a Lewis-convention when Liz and Robert have common knowledge of A_1, A_2, and A_3. Had their expectations been different, so either had believed that the other would not follow (s_2, s_2), then the outcome might have been very different.

Sugden (1986) and Vanderschraaf (1997) argue that it is not crucial to the notion of convention that the corresponding equilibrium be a coordination equilibrium. Lewis' key insight is that a convention is a pattern of mutually beneficial behavior which depends on the agents' common knowledge that all follow *this* pattern, and no other. Vanderschraaf gives a more general definition of convention as a *strict* equilibrium together with common knowledge that all follow this equilibrium and that all would have followed a different equilibrium had their beliefs about each other been different. An example of this more general kind of convention is given below in the discussion of the Figure 3.1 example.

3.3 Strategic Form Games

Lewis formulated the notion of common knowledge as part of his general account of conventions. In the years following the publication of *Convention*, game theorists have recognized that any explanation of a particular pattern of play in a game depends crucially on mutual and common knowledge assumptions. More specifically, *solution concepts* in game theory are both motivated and justified in large part by the mutual or common knowledge the agents in the game have regarding their situation.

To establish the notation that will be used in the discussion that follows, the usual definitions of a game in strategic form, expected utility and agents' distributions over their opponents' strategies, are given here:

Definition 3.2
A *game* Γ is an ordered triple $(N, S, \boldsymbol{u})$ consisting of the following elements:

- A finite set $N = \{1,2, \ldots , n\}$, called the *set of agents* or *players.*
- For each agent $k \in N$, there is a finite set $S_k = \{s_{k1},s_{k2}, \ldots , s_{kn_k}\}$, called the *alternative pure strategies* for agent k. The Cartesian product $S = S_1 \times \ldots \times S_n$ is called the *pure strategy set* for the game Γ.
- A map $\boldsymbol{u} : S \rightarrow \mathbb{R}^n$, called the *utility* or *payoff function* on the pure strategy set. At each strategy combination $\boldsymbol{s} = (s_{1\,j_1}, \ldots , s_{n\,j_n}) \in S$, agent k's particular payoff or utility is given by the k^{th} component of the value of $\boldsymbol{u}$, that is, agent k's utility u_k at $\boldsymbol{s}$ is determined by

$$u_k(\boldsymbol{s}) = I_k(\boldsymbol{u}(s_{1\,j_1}, \ldots , s_{n\,j_n}))$$

where $I_k(\boldsymbol{x})$ projects $\boldsymbol{x} \in \mathbb{R}^n$ onto its k^{th} component.

The subscript '$-k$' indicates the result of removing the k^{th} component of an n-tuple or an n-fold Cartesian product. For instance,

$$S_{-k} = S_1 \times \ldots \times S_{k-1} \times S_{k+1} \times \ldots \times S_n$$

denotes the pure strategy combinations that agent k's opponents may play.

Now let us formally introduce a system of the agents' beliefs into this framework. $\Delta_k(S_{-k})$ denotes the set of probability distributions over the measurable space $(S_{-k}, \mathfrak{F}_k)$, where $\mathfrak{F}_k$ denotes the Boolean algebra generated by the strategy combinations S_{-k}. Each agent k has a probability distribution $\mu_k \in \Delta_k(S_{-k})$, and this distribution determines the *(Savage) expected utilities* for each of k's possible acts:

$$E(u_k(s_{k\,j})) = \sum_{A_{-k} \in S_{-k}} u_k(s_{k\,j}, \boldsymbol{s}_{-k})\, \mu_k(\boldsymbol{s}_{-k}), \quad j = 1, 2, \ldots , n_k$$

If i is an opponent of k, then i's individual strategy $s_{i\,j}$ may be characterized as a union of strategy combinations $\bigcup\{ \boldsymbol{s}_{-k} \mid s_{i\,j} \in \boldsymbol{s}_{-k} \} \in \mathfrak{F}_k$, and so k's marginal probability for i's strategy $s_{i\,j}$ may be calculated as follows:

$$\mu_k(s_{ij}) = \sum_{\{ s_{-k} \mid s_{ij} \in s_{-k} \}} \mu_k(s_{-k})$$

$\mu_k(\cdot \mid A)$ denotes k's conditional probability distribution given a set A, and $E(\cdot \mid A)$ denotes k's conditional expectation given $\mu_k(\cdot \mid A)$.

Suppose first that the agents have common knowledge of the full payoff structure of the game they are engaged in and that they are all rational, and that no other information is common knowledge. In other words, each agent knows that her opponents are expected utility maximizers, but does not in general know exactly which strategies they will choose or what their probabilities for her acts are. These common knowledge assumptions are the motivational basis for the solution concept for noncooperative games known as *rationalizability*, introduced independently by Bernheim (1984) and Pearce (1984). Roughly speaking, a *rationalizable strategy* is any strategy an agent may choose without violating common knowledge of Bayesian rationality. Bernheim and Pearce argue that when only the structure of the game and the agents' Bayesian rationality are common knowledge, the game should be considered "solved" if every agent plays a rationalizable strategy. For instance, in the "Chicken" game with payoff structure defined by Figure 3.1,

		Joanna s_1	Joanna s_2
Lizzi	s_1	(3, 3)	(2, 4)
	s_2	(4, 2)	(0, 0)

s_1 = cooperate, s_2 = defect

Figure 3.1

if Joanna and Lizzi have common knowledge of all of the payoffs at every strategy combination, and they have common knowledge that both are Bayesian rational, then any of the four pure strategy profiles is rationalizable. For if their beliefs about each other are defined by the probabilities

$\alpha_1 = \mu_1$ (Joanna plays s_1), and
$\alpha_2 = \mu_2$ (Lizzi plays s_1)

then

$$E(u_i(s_1)) = 3\alpha_i + 2(1 - \alpha_i) = \alpha_i + 2$$

and

$$E(u_i(s_2)) = 4\alpha_i + 0(1 - \alpha_i) = 4\alpha_i, \quad i = 1, 2$$

so each agent maximizes her expected utility by playing s_1 if $\alpha_i + 2 \geq 4\alpha_i$ or $\alpha_i \leq 2/3$ and maximizes her expected utility by playing s_2 if $\alpha_i \geq 2/3$. If it so happens that $\alpha_i > 2/3$ for both agents, then both conform with Bayesian rationality by playing their respective ends of the strategy combination (s_2,s_2) *given their beliefs*, even though each would want to defect from this strategy combination were she to discover that the other is in fact going to play s_2. Note that the game's pure strategy Nash equilibria, (s_1, s_2) and (s_2, s_1), are rationalizable, since it is rational for Lizzi and Joanna to conform with either equilibrium given appropriate distributions. In general, the set of a game's rationalizable strategy combinations contains the set of the game's pure strategy Nash equilibria, and this example shows that the containment can be proper.

To show that rationalizability is a nontrivial notion, consider the 2-agent game with payoff structure defined by Figure 3.2a:

		Joanna		
		s_1	s_2	s_3
	s_1	(4, 3)	(1, 2)	(3, 4)
Lizzi	s_2	(1, 1)	(0, 5)	(1, 1)
	s_3	(3, 4)	(1, 3)	(4, 3)

Figure 3.2a

In this game, s_1 and s_3 strictly dominate s_2 for Lizzi, so Lizzi cannot play s_2 on pain of violating Bayesian rationality. Joanna knows this, so Joanna knows that the only pure strategy profiles which are possible outcomes of the game will be among the six profiles in which Lizzi does not choose s_2. In effect, the 3×3 game is reduced to the 2×3 game defined by Figure 3.2b:

Lizzi \ Joanna	s_1	s_2	s_3
s_1	(4, 3)	(1, 2)	(3, 4)
s_3	(3, 4)	(1, 3)	(4, 3)

Figure 3.2b

In this reduced game, s_2 is strictly dominated for Joanna by s_1, and so Joanna will rule out playing s_2. Lizzi knows this, and so she rules out strategy combinations in which Joanna plays s_2. The rationalizable strategy profiles are the four profiles that remain after deleting all of the strategy combinations in which either Lizzi or Joanna play s_2. In effect, common knowledge of Bayesian rationality reduces the 3 × 3 game of Figure 3.2a to the 2 × 2 game defined by Figure 3.2c:

Lizzi \ Joanna	s_1	s_3
s_1	(4, 3)	(3, 4)
s_3	(3, 4)	(4, 3)

Figure 3.2c

since Lizzi and Joanna both know that the only possible outcomes of the game are (s_1, s_1), (s_1, s_3), (s_3, s_1), and (s_3, s_3).

Rationalizability can be defined formally in several ways. A variation of Bernheim's original (1984) definition is given here.

Definition 3.3
Given that each agent $k \in N$ has a probability distribution $\mu_k \in \Delta_k(s_{-k})$, the system of beliefs

$$\boldsymbol{\mu} = (\mu_1, \ldots, \mu_n) \in \Delta_1(S_{-1}) \times \ldots \times \Delta_n(S_{-n})$$

is *Bayes concordant* if and only if,

(3.i) For $i \neq k$, $\mu_i(s_{k\,j}) > 0 \Rightarrow s_{k\,j}$ maximizes k's expected utility for some $\sigma_k \in \Delta_k(s_{-k})$,

and (3.i) is common knowledge. A pure strategy combination $\boldsymbol{s} = (s_{1\,j_1}, \ldots , s_{n\,j_n}) \in S$ is *rationalizable* if and only if the agents have a Bayes concordant system $\boldsymbol{\mu}$ of beliefs and, for each agent $k \in N$,

(3.ii) $E(u_k(s_{k\,j_k})) \geq E(u_k(s_{k\,i_k}))$, for $i_k \neq j_k$.[20]

The following result shows that the common knowledge restriction on the distributions in Definition 3.1 formalizes the assumption that the agents have common knowledge of Bayesian rationality.

Proposition 3.4
In a game Γ, common knowledge of Bayesian rationality is satisfied if, and only if, (3.i) is common knowledge.

Proof.

When agents have common knowledge of the game and their Bayesian rationality only, one can predict that they will follow a rationalizable strategy profile. However, rationalizability becomes an unstable solution concept if the agents come to know more about one another. For instance, in the Chicken example above with $\alpha_i > 2/3$, $i = 1, 2$, if either agent were to discover the other agent's beliefs about her, she would have good reason not to follow the (s_2, s_2) profile and to revise her own beliefs regarding the other agent. If, in the other hand, it so happens that $\alpha_1 = 1$ and $\alpha_2 = 0$, so that the agents maximize expected payoff by following the (s_2, s_1) profile, then should the agents discover their beliefs about each other, they will still follow (s_2, s_1). Indeed, if their beliefs are common knowledge, then one can predict with certainty that they will follow (s_2, s_1). The Nash equilibrium (s_2, s_1) is characterized by the belief distributions defined by $\alpha_1 = 1$ and $\alpha_2 = 0$.

The Nash equilibrium is a special case of *correlated equilibrium concepts*, which are defined in terms of the belief distributions of the agents in a game. In general, a correlated equilibrium-in-beliefs is a system of agents' probability distributions which remains stable given common knowledge of the game, rationality and the *beliefs themselves*. We will review two alternative correlated equilibrium concepts (Aumann 1974, 1987; Vanderschraaf 1995), and show how each generalizes the Nash equilibrium concept.

Definition 3.5
Given that each agent $k \in N$ has a probability distribution $\mu_k \in \Delta_k(s_{-k})$, the system of beliefs

$$\mu^* = (\mu_1^*, \ldots, \mu_n^*) \in \Delta_1(s_{-1}) \times \ldots \times \Delta_n(s_{-n})$$

is an *endogenous correlated equilibrium* if, and only if,

(3.iii) For $i \neq k$, $\mu_i^*(s_{k\,j}) > 0 \Rightarrow s_{k\,j}$ maximizes k's expected utility given μ_k^*.

If μ^* is an endogenous correlated equilibrium a pure strategy combination $\boldsymbol{s}^* = (s_1^*, \ldots, s_n^*) \in$ S is an *endogenous correlated equilibrium strategy combination given* μ^* if, and only if, for each agent $k \in N$,

(3.iv) $E(u_k(s_k^*)) \geq E(u_k(s_{k\,i}))$ for $s_{k\,i} \neq s_k^*$.

Hence, the endogenous correlated equilibrium μ^* restricts the set of strategies that the agents might follow, as do the Bayes concordant beliefs of rationalizability. However, the endogenous correlated equilibrium concept is a proper refinement of rationalizability, because the latter does not presuppose that condition (3.iii) holds with respect to the beliefs one's opponents actually have. If exactly one pure strategy combination $\boldsymbol{s}^*$ satisfies (3.iv) given μ^*, then μ^* is a *strict equilibrium,* and in this case one can predict with certainty what the agents will do given common knowledge of the game, rationality and their beliefs. Note that Definition 3.5 says nothing about whether or not the agents regard their opponents' strategy combinations as probabilistically independent. Also, this definition does not require that the agents' probabilities are *consistent*, in the sense that agents' probabilities for a mutual opponent's acts agree. A simple refinement of the endogenous correlated equilibrium concept characterizes the Nash equilibrium concept.

Definition 3.6

A system of agents' beliefs μ^* is a *Nash equilibrium* if, and only if,

- condition (3.iii) is satisfied,
- For each $k \in N$, μ_k^* satisfies probabilistic independance, and
- For each $s_{k\,j} \in s_k$, if $i, l \neq k$ then $\mu_i^*(s_{k\,j}) = \mu_l^*(s_{k\,j})$.

In other words, an endogenous correlated equilibrium is a Nash equilibrium-in-beliefs when each agent regards the moves of his opponents as probabilistically independent and the agents' probabilities are consistent. Note that in the 2-agent case, conditions (b) and (c) of the Definition 3.6 are always satisfied, so for 2-agent games the endogenous correlated equilibrium concept reduces to the Nash equilibrium concept. Conditions (b) and (c) are traditionally assumed in game theory, but Skyrms (1991) and Vanderschraaf (1995) argue that there may be good reasons to relax these assumptions in games with 3 or more agents.

Brandenburger and Dekel (1988) show that in 2-agent games, if the beliefs of the agents are common knowledge, condition (3.iii) characterizes a Nash equilibrium-in-beliefs. As they note, condition (3.iii) characterizes a Nash equilibrium in beliefs for the *n*-agent case if the probability distributions are consistent and satisfy probabilistic independence. Proposition 3.7 extends Brandenburger and Dekel's result to the endogenous correlated equilibrium concept by relaxing the consistency and probabilistic independence assumptions.

Proposition 3.7
Assume that the probabilities

$$\boldsymbol{\mu} = (\mu_1,\ldots,\mu_n) \in \Delta_1(s_{-1}) \times \ldots \times \Delta_n(s_{-n})$$

are common knowledge. Then common knowledge of Bayesian rationality is satisfied if, and only if, $\boldsymbol{\mu}$ is an endogenous correlated equilibrium.

Proof.

In addition, we have:

Corollary 3.8 (Brandenburger and Dekel, 1988)
Assume in a 2-agent game that the probabilities

$$\boldsymbol{\mu} = (\mu_1,\mu_2) \in \Delta_1(s_{-1}) \times \Delta_2(s_{-2})$$

are common knowledge. Then common knowledge of Bayesian rationality is satisfied if, and only if, $\boldsymbol{\mu}$ is a Nash equilibrium.

Proof.
The endogenous correlated equilibrium concept reduces to the Nash equilibrium concept in the 2-agent case, so the corollary follows by Proposition 3.7.

If $\boldsymbol{\mu}*$ is a strict equilibrium, then one can predict which pure strategy profile the agents in a game will follow given common knowledge of the game, rationality and $\boldsymbol{\mu}*$. But if $\boldsymbol{\mu}*$ is such that several distinct pure strategy profiles satisfy (3.iv) with respect to $\boldsymbol{\mu}*$, then one can no longer predict with certainty what the agents will do. For instance, in the Chicken game of Figure 3.1, the belief distributions defined by $\alpha_1 = \alpha_2 = 2/3$ together are a Nash equilibrium-in-beliefs. Given common knowledge of this equilibrium, either pure strategy is a best reply for each agent, in the sense that either pure strategy maximizes expected utility. Indeed, if agents can also adopt randomized or *mixed* strategies at which they follow one of several pure strategies according to the outcome of a chance experiment, then any of the infinitely mixed strategies an agent might adopt in Chicken is a best reply given $\boldsymbol{\mu}*$.[21] So the endogenous

correlated equilibrium concept does not determine the exact outcome of a game in all cases, even if one assumes probabilistic consistency and independence so that the equilibrium is a Nash equilibrium.

Another correlated equilibrium concept formalized by Aumann (1974, 1987) does give a determinate prediction of what agents will do in a game given appropriate common knowledge. To illustrate Aumann's correlated equilibrium concept, let us consider the Figure 3.1 game once more. If Joanna and Lizzi can tie their strategies to their knowledge of the possible worlds in a certain way, they can follow a system of correlated strategies which will yield a payoff vector they both prefer to that of the mixed Nash equilibrium and which is itself an equilibrium. One way they can achieve this is to have their friend Ron play a variation of the familiar shell game by hiding a pea under one of three walnut shells, numbered 1, 2 and 3. Joanna and Lizzi both think that each of the three relevant possible worlds corresponding to ω_k = {the pea lies under shell k} is equally likely. Ron then gives Lizzi and Joanna each a private recommendation, based upon the outcome of the game, which defines a system of strategy combinations f as follows

$$(\bigstar)\ f(\omega) = \begin{cases} (s_1,s_1) \text{ if } \omega_k = \omega_1 \\ (s_1,s_2) \text{ if } \omega_k = \omega_2 \\ (s_2,s_1) \text{ if } \omega_k = \omega_3 \end{cases}$$

f is a *correlated* strategy system because the agents tie their strategies, by following their recommendations, to the same set of states of the world Ω. *f* is also a strict *Aumann correlated equilibrium*, for if each agent knows how Ron makes his recommendations, but knows only the recommendation he gives her, either would do strictly worse were she to deviate from her recommendation.[22] Since there are several strict equilibria of Chicken, *f* corresponds to a convention as defined in Vanderschraaf (1997). The overall expected payoff vector of *f* is (3,3), which lies outside the convex hull of the payoffs for the game's Nash equilibria and which Pareto-dominates the expected payoff vector (4/3, 4/3), of the mixed Nash equilibrium defined by α_1 = 2/3, *i* = 1, 2.[23] The correlated equilibrium f is characterized by the probability distribution of the agents' play over the strategy profiles, given in Figure 3.3:

Lizzi \ Joanna	s_1	s_2
s_1	$\frac{1}{3}$	$\frac{1}{3}$
s_2	$\frac{1}{3}$	0

Figure 3.3

Aumann (1987) proves a result relating his correlated equilibrium concept to common knowledge. To review this result, we must give the formal definition of Aumann correlated equilibrium.

Definition 3.9
Given a game $\Gamma = (N, S, \boldsymbol{u})$ together with a finite set of possible worlds Ω, the vector valued function $f\colon \Omega \rightarrow S$ is a *correlated n-tuple*. If $f(\omega) = (f_1(\omega), \ldots, f_n(\omega))$ denotes the components of f for the agents of N, then agent k's *recommended strategy* at ω is $f_k(\omega)$. f is an *Aumann correlated equilibrium* iff

$$E(u_k \circ f) \geq E(u_k(f_{-k}, g_k)),$$

for each $k \in N$ and for any function g_k that is a function of f_i.

The agents are at Aumann correlated equilibrium if at each possible world $\omega \in \Omega$, no agent will want to deviate from his recommended strategy, given that the others follow their recommended strategies. Hence, Aumann correlated equilibrium uniquely specifies the strategy of each agent, by explicitly introducing a space of possible worlds to which agents can correlate their acts. The deviations g_i are required to be functions of f_i, that is, compositions of some other function with f_i, because i is informed of $f_i(\omega)$ only, and so can only distinguish between the possible worlds of Ω that are distinguished by f_i. As noted already, the primary difference between Aumann's notion of correlated equilibrium and the endogenous correlated equilibrium is that in Aumann's correlated equilibrium, the agents correlate their strategies to some event $\omega \in \Omega$ that is external to the game. One way to view this difference is that agents who correlate their strategies exogenously can calculate their expected utilities conditional on their own strategies.

In Aumann's model, a description of each possible world ω includes descriptions of the following: the game Γ, the agent's private information partitions, and the actions chosen by each agent at ω, and each agent's prior probability distribution $\mu_k(\cdot)$ over Ω. The basic idea is that conditional on ω, everyone knows everything that can be the object of uncertainty on the part of any agent, but in general, no agent necessarily knows which world ω is the actual world. The agents can use their priors to calculate the probabilities that the various act combinations $\boldsymbol{s} \in S$ are played. If the agents' priors are such that for all i, $j \in N$, $\mu_i(\omega) = 0$ iff $\mu_j(\omega) = 0$, then the agents' priors are *mutually absolutely continuous*. If the agents' priors all agree, that is, $\mu_1(\omega) = \ldots = \mu_n(\omega) = \mu(\omega)$ for each $\omega \in \Omega$, then it is said that the *common prior assumption*, or CPA, is satisfied. If agents are following an Aumann correlated equilibrium f and the CPA is satisfied, then f is an *objective* Aumann correlated equilibrium. An Aumann correlated equilibrium is a Nash equilibrium if the CPA is satisfied and the agents' distributions satisfy probabilistic independence.[24]

Let $s_i(\omega)$ denote the strategy chosen by agent i at possible world ω. Then $s\colon \Omega \rightarrow S$ defined by $s(\omega) = (s_1(\omega),\ldots,s_n(\omega))$ is a correlated n-tuple. Given that $\mathcal{H}_i$ is a partition of Ω,[25] the function $s_i\colon \Omega \rightarrow s_i$

defined by s is $\mathcal{H}_i$-*measurable* if for each $\mathcal{H}_{ij} \in \mathcal{H}_i$, $s_i(\omega')$ is constant for each $\omega' \in \mathcal{H}_{ij}$. $\mathcal{H}_i$-measurability is a formal way of saying that i knows what she will do at each possible world, given her information.

Definition 3.10
Agent i is *Bayes rational* with respect to $\omega \in \Omega$ (alternatively, ω-*Bayes rational*) iff s_i is $\mathcal{H}_i$-measurable and

$$E(u_i \circ s \mid \mathcal{H}_i)(\omega) \geq E(u_i(v_i, s_{-\mathrm{i}}) \mid \mathcal{H}_i)(\omega)$$

for any $\mathcal{H}_i$-measurable function $v_i : \Omega \rightarrow s_i$.

Note that Aumann's definition of ω-Bayesian rationality implies that $\mu_i(\mathcal{H}_i(\omega)) > 0$, so that the conditional expectations are defined. Aumann's main result, given next, implicitly assumes that $\mu_i(\mathcal{H}_i(\omega)) > 0$ for every agent $i \in N$ and every possible world $\omega \in \Omega$. This poses no technical difficulties if the CPA is satisfied, or even if the priors are only mutually absolutely continuous, since if this is the case then one can simply drop any ω with zero prior from consideration.

Proposition 3.11 (Aumann 1987)
If each agent $i \in N$ is ω-Bayes rational at each possible world $\omega \in \Omega$, then the agents are following an Aumann correlated equilibrium. If the CPA is satisfied, then the correlated equilibrium is objective.

Proof.

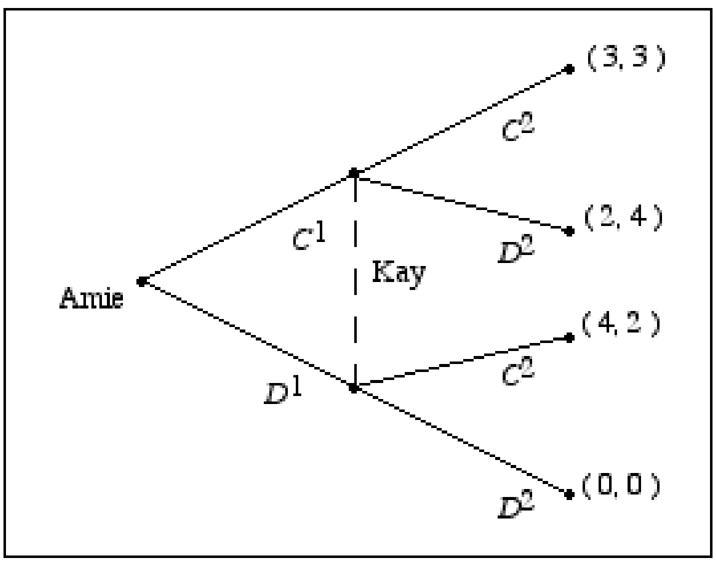
Part of the uncertainty the agents might have about their situation is whether or not all agents are rational. But if it is assumed that all agents are ω-Bayesian rational at each $\omega \in \Omega$, then a description of this fact forms part of the description of each possible ω and thus lies in the meet of the agents' partitions. As noted already, descriptions of the agents' priors, their partitions and the game also form part of the description of each possible world, so propositions corresponding to these facts also lie in the meet of the agents' partitions. So another way of stating Aumann's main result is as follows: *Common knowledge of ω-Bayesian rationality at each possible world implies that the agents follow an Aumann correlated equilibrium.*

Propositions 3.7 and 3.11 are powerful results. They say that common knowledge of rationality and of agents beliefs about each other, quantified as their probability distributions over the strategy profiles they might follow, implies that the agents' beliefs characterize an equilibrium of the game. Then if the agents' beliefs are unconditional, Proposition 3.7 says that the agents are rational to follow a strategy profile consistent with the corresponding endogenous correlated equilibrium. If their beliefs are conditional on their private information partitions, then Proposition 3.11 says they are rational to follow the strategies the corresponding Aumann correlated equilibrium recommends. However, we must not overestimate the

importance of these results, for they say nothing about the *origins* of the common knowledge of rationality and beliefs. For instance, in the Chicken game of Figure 3.1, we considered an example of a correlated equilibrium in which it was *assumed* that Lizzi and Joanna had common knowledge of the system of recommended strategies defined by (★). Given this common knowledge, Joanna and Lizzi indeed have decisive reason to follow the Aumann correlated equilibrium f. But where did this common knowledge come from? How, in general, do agents come to have the common knowledge which justifies their conforming to an equilibrium? Philosophers and social scientists have made only limited progress in addressing this question.

3.4 Games of Perfect Information

In extensive form games, the agents move in sequence. At each stage, the agent who is to move must base her decisions upon what she knows about the preceding moves. This part of the agent's knowledge is characterized by an *information set*, which is the set of alternative moves that an agent knows her predecessor might have chosen. For instance, consider the extensive form game of Figure 3.4:



C^i = "cooperate", D^i = "defect"

Figure 3.4

When Joanna moves she is at her information set $I^{22} = \{C^1, D^1\}$, that is, she moves knowing that Lizzi might have chosen either C^1 or D^1, so this game is an extensive form representation of the Chicken game of Figure 3.1.

In a game of perfect information, each information set consists of a single node in the game tree, since by definition at each state the agent who is to move knows exactly how her predecessors have moved. In Example 1.4 it was noted that the method of backwards induction can be applied to any game of perfect

information.[26] The backwards induction solution is the unique Nash equilibrium of a game of perfect information. The following result gives sufficient conditions to justify backwards induction play in a game of perfect information:

> **Proposition 3.12** (Bicchieri 1993)
> In an extensive form game of perfect information, the agents follow the backwards induction solution if the following conditions are satisfied for each agent i at each information set I^{ik}:
>
> - i is rational, i knows this and i knows the game, and
> - At any information set I^{jk+1} that immediately follows I^{ik}, i knows at I^{ik} what j knows at I^{jk+1}.
>
> Proof.

Proposition 3.12 says that far less than common knowledge of the game and of rationality suffices for the backwards induction solution to obtain in a game of perfect information. All that is needed is for each agent at each of her information sets to be rational, to know the game and to know what the next agent to move knows! For instance, in the Figure 1.2 game, if R_1 (R_2) stands for "Alan (Fiona) is rational" and $\mathbf{K}_i(\Gamma)$ stands for "i knows the game Γ", then the backwards induction solution is implied by the following:

- At I^{24}, R_2 and $\mathbf{K}_2(\Gamma)$.
- At I^{13}, R_1, $\mathbf{K}_1(\Gamma)$, $\mathbf{K}_1(R_2)$, and $\mathbf{K}_1\mathbf{K}_2(\Gamma)$.
- At I^{22}, $\mathbf{K}_2(R_1)$, $\mathbf{K}_2\mathbf{K}_1(R_2)$, and $\mathbf{K}_2\mathbf{K}_1\mathbf{K}_2(\Gamma)$.
- At I^{11}, $\mathbf{K}_1\mathbf{K}_2(R_1)$, $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1(R_2)$, and $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1\mathbf{K}_2(\Gamma)$.[27]

One might think that a corollary to Proposition 3.11 is that in a game of perfect information, common knowledge of the game and of rationality implies the backwards induction solution. This is the *classical argument* for the backwards induction solution. Many game theorists continue to accept the classical argument, but in recent years, the argument has come under strong challenge, led by the work of Reny (1987, 1992), Binmore (1987) and Bicchieri (1989, 1993). The basic idea underlying their criticisms of backwards induction can be illustrated with the Figure 1.2 game. According to the classical argument, if Alan and Fiona have common knowledge of rationality and the game, then each will predict that the other will follow her end of the backwards induction solution, to which his end of the backwards induction solution is his unique best response. However, what if Fiona reconsiders what to do if she finds herself at the information set I^{22}? If the information set I^{22} is reached, then Alan has of course not followed the backwards induction solution. If we assume that at I^{22}, Fiona knows only what is stated in (iii), then she can explain her being at I^{22} as a failure of either $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1(R_2)$ or $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1\mathbf{K}_2(\Gamma)$ at I^{11}. In this case, Fiona's thinking that either $\sim\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1(R_2)$ or $\sim\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1\mathbf{K}_2(\Gamma)$ at I^{11} is compatible with what Alan in fact does know at I^{11}, so Fiona should not necessarily be surprised to find herself at I^{22}, and given that what

she knows there is characterized by (iii), following the backwards induction solution is her best strategy. But if rationality and the game are common knowledge, or even if Fiona and Alan both have just have mutual knowledge of the statements characterized by (iii) and (iv), then at I^{22}, Fiona knows that $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1(R_2)$ or $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1\mathbf{K}_2(\Gamma)$ at I^{11}. Hence given this much mutual knowledge, Fiona no longer can explain why Alan has deviated from the backwards induction solution, since this deviation contradicts part of what is their mutual knowledge. So if she finds herself at I^{22}, Fiona does not necessarily have good reason to think that Alan will follow the backwards induction solution of the subgame beginning at I^{22}, and hence she might not have good reason to follow the backwards induction solution, either. Bicchieri (1993), who along with Binmore (1987) and Reny (1987, 1992) extends this argument to games of perfect information with arbitrary length, draws a startling conclusion: If agents have strictly too few or *strictly too many* levels of mutual knowledge of rationality and the game relative to the number of potential moves, one cannot predict that they will follow the backwards induction solution. This would undermine the central role backwards induction has played in the analysis of extensive form games. For why should the number of levels of mutual knowledge the agents have depend upon the length of the game?

The classical argument for backwards induction implicitly assumes that at each stage of the game, the agents discount the preceding moves as strategically irrelevant. Defenders of the classical argument can argue that this assumption makes sense, since by definition at any agents' decision node, the previous moves that led to this node are now fixed. Critics of the classical argument question this assumption, contending that when reasoning about how to move at any of his information sets, *including those not on the backwards induction equilibrium path*, part of what an agent must consider is what conditions might have led to his being at that information set. In other words, agents should incorporate reasoning about the reasoning of the previous movers, or *forward induction* reasoning, into their deliberations over how to move at a given information set. Binmore (1987) and Bicchieri (1993) contend that a backwards induction solution to a game should be consistent with the solution a corresponding forward induction argument recommends. As we have seen, given common knowledge of the game and of rationality, forward induction reasoning can lead the agents to an apparent contradiction: The classical argument for backwards induction is predicated on what agents predict they would do at nodes in the tree that are never reached. They make these predictions based upon their common knowledge of the game and of rationality. But forward induction reasoning seems to imply that if any off-equilibrium node had been reached, common knowledge of rationality and the game must have failed, so how could the agents have predicted what would happen at these nodes?

This section has barely scratched the surface of this controversy over common knowledge and backwards induction. The key unresolved issue is of course explaining what happens at the off-equilibrium information sets. To date, there is not a generally accepted theory of what agents having certain mutual or common knowledge will do at off-equilibrium nodes. However, we can at least repeat one generally accepted conclusion: In a game of perfect information, mutual knowledge of rationality and the game which falls far short of common knowledge can suffice to explain why agents follow the game's Nash equilibrium, the backwards induction solution. On the other hand, unlike other examples we have considered in which agents have mutual and even common knowledge without having to reason through levels of knowledge, backwards induction arguments in games of perfect information require that at each

information set, the agent who would move were the information set to be reached must reason her way through at least as many levels of knowledge as there are remaining potential moves in the game.

4. Is Common Knowledge Attainable?

Lewis formulated an account of common knowledge which generates the hierarchy of'*i* knows that *j* knows that … *k* knows that *A*' propositions in order to ensure that in his account of convention, agents have correct beliefs about each other. But since human agents obviously cannot reason their way through such an infinite hierarchy, it is natural to wonder whether any group of people can have full common knowledge of any proposition. More broadly, the analyses of common knowledge reviewed in §3 would be of little worth to social scientists and philosophers if this common knowledge lies beyond the reach of human agents.

Fortunately for Lewis' program, there are strong arguments that common knowledge is indeed attainable. Lewis (1969) and Schiffer (1972) argue that the common knowledge hierarchy should be viewed as a chain of implications, and not as steps in anyone's actual reasoning. They give informal arguments that the common knowledge hierarchy is generated from a finite set of axioms. We saw in §2 that it is possible to formulate Lewis' axioms precisely and to derive the common knowledge hierarchy from these axioms. Again, the basic idea behind Lewis' argument is that for a set of agents, if a proposition A is publicly known among them and each agent knows that everyone can draw the same conclusions from A that she can, then A is common knowledge. These conditions are obviously context dependent, just as an individual's knowing or not knowing a proposition is context dependent. Yet there are many cases where it is natural to assume that Lewis' conditions are satisfied. If, for instance, a group of English speaking persons in an automobile are listening to the radio, and the following special news announcement, "The Pope has abdicated", is audibly broadcast, then one may safely conclude that it is common knowledge for this group that the Pope has abdicated. If one has skeptical doubts about the agents' common knowledge in this situation, then one would have to explain the failure of common knowledge as the result of some circumstance that would be quite surprising in this context. Common knowledge could fail if some of the people failed to hear the announcement, or if some of them believed that some of the others could not understand the announcement, but circumstances such as these would be quite peculiar given the stated assumptions in this story. In this context, skeptical doubt about common knowledge is certainly possible, but such doubt relies upon *ad hoc* assumptions similar to those that are needed to explain failure of *individual* knowledge, not with the attainability of common knowledge in principle.

Aumann (1976) gives an alternate finitary procedure for generating the common knowledge hierarchy in the special case in which the relevant number of possible worlds in Ω is finite and each agent's information system partitions Ω. To be sure, knowledge does not always come so neatly packaged, but in many applications a finite state space together with partitions is a good model of the actual situation agents face. Aumann shows that a proposition *A* is common knowledge for a set *N* of agents at ω, if and only if, $\mathcal{M}(\omega) \subseteq A$ where $\mathcal{M}(\omega)$ is the element in the meet of the agents' private information partitions containing ω. In words, anything implied by the agents' common information partition is common

knowledge. If the set Ω is finite, then the meet $\mathcal{M}$ of the agents' partitions $\mathcal{H}_i$, $i \in N$, can be computed in finitely many steps. In a certain sense, the issue of skepticism regarding common knowledge never arises in Aumann's model. Common knowledge is built into Aumann's model, as a result of the agents' having private knowledge which is defined by *partitions* over the possible worlds. Put another way, common knowledge could fail in Aumann's model only if at some $\omega \in \Omega$, some individual i's knowledge of $\mathcal{H}_i(\omega)$ in i's private information partition could fail, which reinforces the point made in the previous paragraph. To reiterate, if one accepts Lewis' and Aumann's analysis of common knowledge, then common knowledge is in principle no more problematic than individual knowledge.

Nevertheless, care must be taken in ascribing common knowledge to a group of human agents. Common knowledge is a phenomenon highly sensitive to the agents' circumstances. The following section gives an example that shows that in order for *A* to be a common truism for a set of agents, they ordinarily must perceive an event which implies *A* *simultaneously* and *publicly*.

5. Coordination and Common *p*-Belief

In certain contexts, agents might not be able to achieve common knowledge. Might they achieve something "close"? One weakening of common knowledge is of course m^{th} level mutual knowledge. For a high value of *m*, $\mathbf{K}^m{}_N(A)$ might seem a good approximation of $\mathbf{K}^*{}_N(A)$. However, the following example, due to Rubinstein (1989, 1992), shows that simply truncating the common knowledge hierarchy at any finite level can lead agents to behave as if they had no mutual knowledge at all.[28]

5.1 The E-mail Coordination Example

Lizzi and Joanna are faced with the coordination problem summarized in the following figure:

ω_1, $\mu(\omega_1) = .51$

Lizzi \ Joanna	A	B
A	(2, 2)	(0, −4)
B	(−4, 0)	(0, 0)

ω_2, $\mu(\omega_2) = .49$

Lizzi \ Joanna	A	B
A	(0, 0)	(0, −4)
B	(−4, 0)	(2, 2)

Figure 5.1

In Figure 5.1, the payoffs are dependent upon a pair of possible worlds. World ω_1 occurs with probability $\mu(\omega_1) = .51$, while ω_2 occurs with probability $\mu(\omega_2) = .49$. Hence, they coordinate with complete success by both choosing *A* (*B*) only if the state of the world is ω_1 (ω_2).

Suppose that Lizzi can observe the state of the world, but Joanna cannot. We can interpret this game as follows: Joanna and Lizzi would like to have a dinner together prepared by Aldo, their favorite chef. Aldo alternates between *A* and *B*, the two branches of Sorriso, their favorite restaurant. State ω_i is Aldo's location that day. At state ω_1 (ω_2), Aldo is at *A* (*B*). Lizzi, who is on Sorriso's special mailing list, receives notice of ω_i. Lizzi's and Joanna's best outcome occurs when they meet where Aldo is working, so they can have their planned dinner. If they meet but miss Aldo, they are disappointed and do not have dinner after all. If either goes to *A* and finds herself alone, then she is again disappointed and does not have dinner. But what each really wants to avoid is going to *B* if the other goes to *A*. If either of them arrives at *B* alone, she not only misses dinner but must pay the exorbitant parking fee of the hotel which houses *B*, since the headwaiter of *B* refuses to validate the parking ticket of anyone who asks for a table for two and then sits alone. This is what Harsanyi (1967) terms a game of *incomplete information*, since the game's payoffs depend upon states which not all the agents know.

A is a "play-it-safe" strategy for both Joanna and Lizzi.[29] By choosing *A* whatever the state of the world happens to be, the agents run the risk that they will fail to get the positive payoff of meeting where Aldo is, but each is also sure to avoid the really bad consequence of choosing *B* if the other chooses *A*. And since only Lizzi knows the state of the world, neither can use information regarding the state of the world to improve their prospects for coordination. For Joanna has no such information, and since Lizzi knows this, she knows that Joanna has to choose accordingly, so Lizzi must choose her best response to the move she anticipates Joanna to make regardless of the state of the world Lizzi observes. Apparently Lizzi and Joanna cannot achieve expected payoffs greater than 1.02 for each, their expected payoffs if they choose (*A*, *A*) at either state of the world.

If the state ω were common knowledge, then the conditional strategy profile (*A*, *A*) if $\omega = \omega_1$ and (*B*, *B*), if $\omega = \omega_2$ would be a strict Nash equilibrium at which each would achieve a payoff of 2. So the obvious remedy to their predicament would be for Lizzi to tell Joanna Aldo's location in a face-to-face or telephone conversation and for them to agree to go where Aldo is, which would make the state ω and their intentions to coordinate on the best outcome given ω common knowledge between them. Suppose for some reason they cannot talk to each other, but they prearrange that Lizzi will send Joanna an e-mail message if, and only if, ω_2 occurs. Suppose further that Joanna's and Lizzi's e-mail systems are set up to send a reply message automatically to the sender of any message received and viewed, and that due to technical problems there is a small probability, $\varepsilon > 0$, that any message can fail to arrive at its destination. Then if Lizzi sends Joanna a message, and receives an automatic confirmation, then Lizzi knows that Joanna knows that ω_2 has occurred. If Joanna receives an automatic confirmation of Lizzi's automatic confirmation, then Joanna knows that Lizzi knows that Joanna knows that ω_2 occurred, and so on. That ω_2 has occurred would become common knowledge if each agent received infinitely many automatic confirmations, assuming that all the confirmations could be sent and received in a finite amount of time.[30] However, because of the probability ε of transmission failure at every stage of communication, the sequence of confirmations stops after finitely many stages with probability one. With probability one, therefore, the agents fail to achieve full common knowledge. But they do at least achieve something

"close" to common knowledge. Does this imply that they have good prospects of settling upon (*B*, *B*)?

Rubinstein shows by induction that if the number of automatically exchanged confirmation messages is finite, then *A* is the only choice that maximizes expected utility for each agent, given what she knows about what they both know.

Rubinstein's Proof

So even if agents have "almost" common knowledge, in the sense that the number of levels of knowledge in "Joanna knows that Lizzi knows that . . . that Joanna knows that ω_2 occurred" is very large, their behavior is quite different from their behavior given common knowledge that ω_2 has occurred. Indeed, as Rubinstein points out, given merely "almost" common knowledge, the agents choose as if no communication had occurred at all! Rubinstein also notes that this result violates our intuitions about what we would expect the agents to do in this case. (See Rubinstein 1992, p. 324.) If $T_i = 17$, wouldn't we expect agent *i* to choose *B*? Indeed, in many actual situations we might think it plausible that the agents would each expect the other to choose *B* even if $T_1 = T_2 = 2$, which is all that is needed for Lizzi to know that Joanna has received her original message and for Joanna to know that Lizzi knows this!

5.2 Common *p*-Belief

The example in Section 5.1 hints that mutual knowledge is not the only weakening of common knowledge that is relevant to coordination. Brandenburger and Dekel (1987), Stinchcombe (1988) and Monderer and Samet (1989) explore another option, which is to weaken the properties of the $\mathbf{K}^*_N$ operator. Monderer and Samet motivate this approach by noting that even if a mutual knowledge hierarchy stops at a certain level, agents might still have higher level mutual *beliefs* about the proposition in question. So they replace the knowledge operator $\mathbf{K}_i$ with a *belief operator* $\mathbf{B}^p_i$:

Definition 5.1
If $\mu_i(\cdot)$ is agent *i*'s probability distribution over Ω, then

$$\mathbf{B}^p_i(A) = \{ \omega \mid \mu_i(A \mid \mathcal{H}_i(\omega)) \geq p \}$$

$\mathbf{B}^p_i(A)$ is to be read '*i* believes *A* (given *i*'s private information) with probability at least *p* at ω', or '*i* *p*-believes *A*'. The belief operator $\mathbf{B}^p_i$ satisfies axioms K2, K3, and K4 of the knowledge operator. $\mathbf{B}^p_i$ does not satisfy K1, but does satisfy the weaker property

$$\mu_i(A \mid \mathbf{B}^p_i(A)) \geq p$$

that is, if one believes *A* with probability at least *p*, then the probability of *A* is indeed at least *p*.

One can define *mutual* and *common p-beliefs* recursively in a manner similar to the definition of mutual and common knowledge:

Definition 5.2
Let a set Ω of possible worlds together with a set of agents N be given.

(1) The proposition that A is *(first level or first order) mutual p-belief for the agents of N*, $\mathbf{B}^p{}_{\mathrm{N}}{}^1(A)$, is the set defined by

$$\mathbf{B}^p{}_{\mathrm{N}}{}^1(A) \equiv \bigcap_{i \in N} \mathbf{B}^p{}_i(A).$$

(2) The proposition that A is m^{th} *level* (or m^{th} *order*) *mutual p-belief among the agents of N*, $\mathbf{B}^p{}_{\mathrm{N}}{}^m(A)$, is defined recursively as the set

$$\mathbf{B}^p{}_{\mathrm{N}}{}^m(A) \equiv \bigcap_{i \in N} \mathbf{B}^p{}_i(\mathbf{B}^p{}_{\mathrm{N}}{}^{m-1}(A))$$

(3) The proposition that A is *common p-belief* among the agents of N, $\mathbf{B}^p{}_N{}^*(A)$, is defined as the set

$$\mathbf{B}^p{}_{\mathrm{N}}{}^*(A) \equiv \bigcap_{m=1}^{\infty} \mathbf{B}^p{}_N{}^m(A).$$

If A is common (or m^{th} level mutual) knowledge at world ω, then A is common (m^{th} level) p-belief at ω for every value of p. So mutual and common p-beliefs formally generalize the mutual and common knowledge concepts. However, note that $\mathbf{B}^1{}_N{}^*(A)$ is not necessarily the same proposition as $\mathbf{K}^*{}_N(A)$, that is, even if A is common 1-belief, A can fail to be common knowledge.

Common p-belief forms a hierarchy similar to a common knowledge hierarchy:

Proposition 5.3
$\omega \in \mathbf{B}^p{}_N{}^m(A)$ iff

(1) For all agents $i_1, i_2, \ldots, i_m \in N$, $\omega \in \mathbf{B}^p{}_{i_1}\mathbf{B}^p{}_{i_2} \ldots \mathbf{B}^p{}_{i_m}(A)$

Hence, $\omega \in \mathbf{B}^p{}_N{}^*(A)$ iff (1) is the case for each $m \geq 1$.

Proof. Similar to the Proof of Proposition 2.5.

One can draw several morals from the e-mail game of Example 5.1. Rubinstein (1987) argues that his conclusion seems paradoxical for the same reason the backwards induction solution of Alan's and Fiona's perfect information game might seem paradoxical: Mathematical induction does not appear to be part of our "everyday" reasoning. This game also shows that in order for A to be a common truism for a set of agents, they ordinarily must perceive an event which implies A *simultaneously* in each others' presence. A third moral is that in some cases, it may make sense for the agents to employ some solution concept weaker than Nash or correlated equilibrium. In their analysis of the e-mail game, Monderer and Samet (1989) introduce the notions of *ex ante* and *ex post* ε-*equilibrium.* An *ex ante* equilibrium *h* is a system of strategy profiles such that no agent *i* expects to gain more than ε-utiles if *i* deviates from *h*. An *ex post* equilibrium h' is a system of strategy profiles such that no agent *i* expects to gain more than ε-utiles by deviating from h' given *i*'s private information. When $\varepsilon = 0$, these concepts coincide, and *h* is a Nash equilibrium. Monderer and Samet show that, while the agents in the e-mail game can never achieve common knowledge of the world ω, if they have common *p*-belief of ω for sufficiently high *p*, then there is an *ex ante* equilibrium at which they follow (*A*,*A*) if $\omega = \omega_1$ and (*B*,*B*), if $\omega = \omega_2$. This equilibrium turns out not to be *ex post*. However, if the situation is changed so that there are no replies, then Lizzi and Joanna could have at most first order mutual knowledge that $\omega = \omega_2$. Monderer and Samet show that in this situation, given sufficiently high common *p*-belief that $\omega = \omega_2$, there is an *ex post* equilibrium at which Joanna and Lizzi choose (*B*,*B*) if $\omega = \omega_2$! So another way one might view this third moral of the e-mail game is that agents' prospects for coordination can sometimes improve dramatically if they rely on their common beliefs as well as their mutual knowledge.

Bibliography

Annotations

Lewis (1969) is the classic pioneering study of common knowledge and its potential applications to conventions and game theory. As Lewis acknowledges, parts of his work are foreshadowed in Hume (1740) and Schelling (1960).

Aumann (1976) gives the first mathematically rigorous formulation of common knowledge using set theory. Schiffer (1972) uses the formal vocabulary of *epistemic logic* (Hintikka 1962) to state his definition of common knowledge. Schiffer's general approach is to augment a system of sentential logic with a set of knowledge operators corresponding to a set of agents, and then to define common knowledge as a hierarchy of propositions in the augmented system. Bacharach (1992), Bicchieri (1993) and Fagin, et. al. (1995) adopt this approach, and develop logical theories of common knowledge which include soundness and completeness theorems. Fagin, et. al. show that the syntactic and set-theoretic approaches to developing common knowledge are logically equivalent.

Aumann (1995) gives a recent defense of the classical view of backwards induction in games of imperfect information. For criticisms of the classical view, see Binmore (1987), Reny (1992), Bicchieri (1989) and

especially Bicchieri (1993). Brandenburger (1992) surveys the known results connecting mutual and common knowledge to solution concepts in game theory. For more in-depth survey articles on common knowledge and its applications to game theory, see Binmore and Brandenburger (1989), Geanakoplos (1994) and Dekel and Gul (1996). For her alternate account of common knowledge along with an account of conventions which opposes Lewis' account, see Gilbert (1989).

Monderer and Samet (1989) remains one of the best resources for the study of common p-belief.

Notes to Common Knowledge

Notes

1. Thanks to Alan Hajek for this example, the only example in this section which does not appear elsewhere in the literature.

2. The version of the story Littlewood analyzes involves a group of cannibals, some of whom are marrried to unfaithful wives, and a missionary who visits the group and makes a public announcement of the fact.

3. Robert Vanderschraaf reminded me in conversation that a crucial assumption in this problem is that the cook is telling the diners the truth, that is, the cook's announcement generates common knowledge and not merely *common belief* that there is at least one messy individual. For if the agents believe the cook's announcements even if the cook does not reliably tell the truth, then should the cook mischeviously announce that there is at least one messy individual when in fact all are clean, all will wipe their faces at once.

4. The mutual knowledge characterized by (i), (ii), and (iii) is sufficient both to account for the agents' following the D^1,D^2-outcome, and for their being able to predict each others' moves. However, weaker knowledge assumptions imply that the agents will play D^1,D^2, even if they might not both be able to predict this outcome before the start of play. As Fiona's quoted argument implies, if both are rational, both know the game, and Fiona knows that Alan is rational and knows the game, then the D^1,D^2-outcome is the result, even if Alan does not know that Fiona is rational or knows the game

5. Hume's analysis of the Farmer's Dilemma is perhaps the earliest example of a backwards induction argument applied to a sequential decision problem. See Skyrms (1996) and Vanderschraaf (1996) for more extended discussions of this argument.

6. See §3 for a formal definition of the Nash equilibrium concept.

7. Aumann (1976) himself gives a set-theoretic account of common knowledge, which has been generalized in several articles in the literature, including Monderer and Samet (1988) and Binmore and Brandenburger (1989). Vanderschraaf (1997) gives the set-theoretic formulation of Lewis' account of common knowledge reviewed in this paper.

8. This result appears in several articles in the literature, including Monderer and Samet's and Binmore

and Brandenburger's articles on common knowledge.

9. I abuse notation slightly, writing '$\mathbf{K}_i\mathbf{K}_j(A)$' for '$\mathbf{K}_i(\mathbf{K}_j(A))$'.

10. A partition of a set Ω is a collection of sets $\mathcal{H} = \{H_1, H_2, \ldots\}$ such that $H_i \cap H_j = \varnothing$ for $i \neq j$, and $\cup_i H_i = \Omega$.

11. Thanks to Chris Miller and Jarah Evslin for suggesting the term 'symmetric reasoner' to decribe the parity of reasoning powers that Lewis relies upon in his treatment of common knowledge. Lewis does not explicitly include the notion of A'-symmetric reasoning into his definition of common knowledge, but he makes use of the notion implicitly in his argument for how his definition of common knowledge generates the mutual knowledge hierarchy.

12. The *meet* $\mathcal{M}$ of a collection $\mathcal{H}_i$, $i \in N$ of partitions is the finest common coarsening of the partitions. More specifically, for any $\omega \in \Omega$, if $\mathcal{M}(\omega)$ is the element of $\mathcal{M}$ containing ω, then

- $\mathcal{H}_i(\omega) \subseteq \mathcal{M}(\omega)$ for all $i \in N$, and
- For any other $\mathcal{M}'$ satisfying (i), $\mathcal{M}(\omega) \subseteq \mathcal{M}'(\omega)$.

13. B^c denotes the complement of B, that is $B^c = \omega - B = \{\omega \in \Omega : \omega \notin \Omega\}$. B^c can be read "not-B".

14. Gilbert does not elaborate further on what counts as epistemic normality.

15. Gilbert (1989, p. 193) also maintains that her account of common knowledge has the advantage of not requiring that the agents reason through an infinite hierarchy of propositions. On her account, the agents' smooth-reasoner counterparts do all the necessary reasoning for them. However, Gilbert fails to note that Aumann's and Lewis' accounts of common knowledge also have this advantage.

16. Harsanyi (1968) is the most famous defender of the CPA. Indeed, Aumann (1974, 1987) calls the CPA the *Harsanyi Doctrine* in Harsanyi's honor.

17. Alan Hajek first pointed this out to me in conversation.

18. An agent's *pure strategies* in a noncooperative game are simply the alternative acts the agent might choose as defined by the game. A mixed strategy $\sigma_k(\cdot)$ is a probability distribution defined over k's pure strategies by some random experiment such as the toss of a coin or the spin of a roulette wheel. k plays each pure strategy s_{kj} with probability $\sigma_k(s_{kj})$ according to the outcome of the experiment, which is assumed to be probabilistically independant of the others' experiments. A strategy is *completely mixed* when each pure strategy has a positive probability of being the one selected by the mixing device.

19. Lewis, (1969), p. 76. Lewis gives a further definition of agents following a convention to a *certain degree* if only a certain percentage of the agents actually conform to the coordination equilibrium corresponding to the convention. See Lewis (1969, pp. 78-89).

20. In their original papers, Bernheim (1984) and Pearce (1984) included in their definitions of rationalizability the requirement that the agents' probability distributions over their opponents satisy *probabilistic independance*, that is, for each agent *k* and for each

$$\mathbf{s}_{-k} = (s_{1_{j_1}}, \ldots, s_{k\text{-}1_{j_{k-1}}}, s_{k+1_{j_{k+1}}}, \ldots, s_{n_{j_n}}) \in S_{-k}$$

k's joint probability must equal the product of k's marginal probabilities, that is,

$$\mu_k(\mathbf{s}_{-k}) = \mu_k(s_{1_{j_1}}) \cdot \ldots \cdot \mu_k(s_{k\text{-}1_{j_{k-1}}}) \cdot \mu_k(s_{k+1_{j_{k+1}}}) \cdot \ldots \cdot \mu_k(s_{n_{j_n}})$$

Brandenburger and Dekel (1987), Skyrms (1990), and Vanderschraaf (1995) all argue that the probabilistic independence requirement is not well-motivated, and do not include this requirement in their presentations of rationalizability. Bernheim (1984) calls a Bayes concordant system of beliefs a "consistent" system of beliefs. Since the term "consistent beliefs" is used in this paper to describe probability distributions that agree with respect to a mutual opponent's strategies, I use the term "Bayes concordant system of beliefs" rather than Bernheim's "consistent system of beliefs".

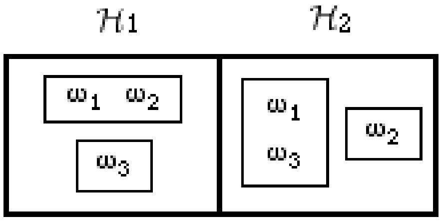
21. A mixed strategy is a propbability distribution $\sigma_k(\cdot)$ defined over *k*'s pure strategies by some random experiment such as the toss of a coin or the spin of a roulette wheel. *k* plays each pure strategy s_{kj} with probability $\sigma_k(s_{kj})$ according to the outcome of the experimentm which is assumed to be probabilistically independent of the others' experiments. A strategy is *completely mixed* when each pure strategy has a positive probability of being the one selected by the mixing device.

Nash (1950, 1951) originally developed the Nash equilibrium concept in terms of mixed strategies. In subsequent years, game theorists have realized that the Nash and more general correlated equilibrium concepts can be defined entirely in terms of agents' beliefs, without recourse to mixed strategies. See Aumann (1987), Brandenburger and Dekel (1988), and Skyrms (1991) for an extended discussion of equilibrium-in-beliefs.

22. Ron's private recommendations in effect partition Ω as follows:

- $\mathcal{H}_1 = \{ \{\omega_1,\omega_2\}, \{\omega_3\} \}$, and
- $\mathcal{H}_2 = \{ \{\omega_1,\omega_3\}, \{\omega_2\} \}$.

These partitions are diagrammed below:



Given their private information, at each possible world ω to which an agent *i* assigns positive probability, following *f* maximizes *i*'s expected utility. For instance, at $\omega = \omega_2$,

$$
\begin{aligned}
E(u_1(A_1) \mid \mathcal{H}_1)(\omega_2) &= ½ \cdot 3 + ½ \cdot 2 \\
&= 5/2 \\
&> 2 = ½ \cdot 4 + ½ \cdot 0 \\
&= E(u_1(A_2) \mid \mathcal{H}_1)(\omega_2)
\end{aligned}
$$

and

$$
\begin{aligned}
E(u_2(A_2) \mid \mathcal{H}_2)(\omega_2) &= 4 \\
&> 3 = E(u_2(A_1) \mid \mathcal{H}_1)(\omega_2)
\end{aligned}
$$

23. An outcome $\mathbf{s}_1$ of a game Pareto-dominates an outcome $\mathbf{s}_2$ if, and only if,

- $E(u_k(\mathbf{s}_1)) \geq E(u_k(\mathbf{s}_2))$ for all $k \in N$.
- $\mathbf{s}_1$ strictly dominates $\mathbf{s}_2$ if the inequalities of (i) are all srict.

24. While both the endogenous and the Aumann correlated equilibrium concepts generalize the Nash equilibrium, neither correlated equilibrium concept contains the other. See Chapter 2 of Vanderschraaf (1995) for examples which show this.

25. Aumann (1987) notes that it is possible to extend the definitions of Aumann correlated equilibrium and $\mathcal{H}_i$-measurability to allow for cases in which Ω is infinite and the $\mathcal{H}_i$'s are not necessarily partitions. However, he argues that there is nothing to be gained conceptually by doing so.

26. In general, the method of backwards induction is undefined for games of imperfect information, although backwards induction reasoning can be applied to a limited extent in such games.

27. By the elementary properties of the knowledge operator, $\mathbf{K}_2\mathbf{K}_1\mathbf{K}_2(\Gamma) \subseteq \mathbf{K}_2\mathbf{K}_1(\Gamma)$ and $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1\mathbf{K}_2(\Gamma) \subseteq \mathbf{K}_1\mathbf{K}_2\mathbf{K}_1(\Gamma)$, so we needn't explicitly state that at I^{22}, $\mathbf{K}_2\mathbf{K}_1(\Gamma)$ and at I^{11}, $\mathbf{K}_1\mathbf{K}_2\mathbf{K}_1(\Gamma)$. By the same elementary properties, the knowledge assumptions at the latter two information sets imply that Fiona and Alan have third-order mutual knowledge of the game and second-order mutual knowledge of rationality. For instance, since $\mathbf{K}_2\mathbf{K}_1(\Gamma)$ is given at I^{22}, we have $\mathbf{K}_2\mathbf{K}_1\mathbf{K}_1(\Gamma)$ because $\mathbf{K}_1(\Gamma) \subseteq \mathbf{K}_1\mathbf{K}_1(\Gamma)$ and so $\mathbf{K}_2\mathbf{K}_1(\Gamma) \subseteq \mathbf{K}_2\mathbf{K}_1\mathrm{K}_1(\Gamma)$. The other statements which characterize third order mutual knowledge of the game and second order mutual knowledge of rationality are similarly derived.

28. The version of the example Rubinstein presents is more general than the version presented here. Rubinstein notes that this game is closely related to the *coordinated attack problem* analyzed in Halpern (1986).

29. In the terminology of decision theory, *A* is each agents' *maximin* strategy.

30. This could be achieved if the e-mail systems were constructed so that each n^{th} confirmation is sent 2^{-n} seconds after receipt of the n^{th} message.

Proof of Proposition 2.4

Proposition 2.4.
If $\omega \in \mathbf{K}^*_N(E)$ and $E \subseteq F$, then $\omega \in \mathbf{K}^*_N(F)$.

Proof.
If $E \subseteq F$, then as we observed earlier, $\mathbf{K}_i(E) \subseteq \mathbf{K}_i(F)$, so

$$\mathbf{K}^1_N(E) = \bigcap_{i \in N} \mathbf{K}_i(E) = \bigcap_{i \in N} \mathbf{K}_i(F) = \mathbf{K}^1_N(F)$$

If we now set $E' = \mathbf{K}^n_N(E)$ and $F' = \mathbf{K}^n_N(F)$, then by the argument just given we have

$$\mathbf{K}^{n+1}_N(E) = \mathbf{K}^1_N(E') \subseteq \mathbf{K}^1_N(F') = \mathbf{K}^{n+1}_N(F)$$

so we have m^{th} level mutual knowledge for every $n \geq 1$.

Hence if $\omega \in \bigcap_{n=1}^{\infty} \mathbf{K}^n_N(E)$ then $\omega \in \bigcap_{n=1}^{\infty} \mathbf{K}^n_N(F)$. □

Proof of Proposition 2.5

Proposition 2.5.
$\omega \in \mathbf{K}^m_N(A)$ iff

(1) For all agents $i_1, i_2, \ldots, i_m \in N$, $\omega \in \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_m}(A)$

Hence, $\omega \in \mathbf{K}^*_N(A)$ iff (1) is the case for each $m \geq 1$.

Proof.
Note first that

$$(2) \quad \bigcap_{i_1 \in N} \mathbf{K}_{i_1}\Big(\bigcap_{i_2 \in N} \mathbf{K}_{i_2}\Big(\ldots\Big(\bigcap_{i_{m-1} \in N} \mathbf{K}_{i_{m-1}}\Big(\bigcap_{i_m \in N} \mathbf{K}_{i_m}(A)\Big)\Big)\Big)\Big)$$

$$= \bigcap_{i_1 \in N} \mathbf{K}_{i_1}\Big(\bigcap_{i_2 \in N} \mathbf{K}_{i_2}\Big(\ldots\Big(\bigcap_{i_{m-1} \in N} \mathbf{K}_{i_{m-1}}(\mathbf{K}^1_N(A))\Big)\Big)\Big)$$

$$= \bigcap_{i_1 \in N} \mathbf{K}_{i_1}\Big(\bigcap_{i_2 \in N} \mathbf{K}_{i_2} \ldots \Big(\bigcap_{i_{m-2} \in N} \mathbf{K}_{i_{m-2}}(\mathbf{K}^2_N(A))\Big)\Big)$$

$$= \ldots$$

$$= \bigcap_{i_1 \in N} \mathbf{K}_{i_1}(\mathbf{K}^{m-1}_N(A))$$

$$= \mathbf{K}^m_N(A)$$

By (2), $\mathbf{K}^m_N(A) \subseteq \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_m}(A)$ for $i_1, i_2, \ldots, i_m \in N$ so if $\omega \in \mathbf{K}^m_N(A)$ then condition (1) is satisfied. Condition (1) is equivalent to

$$\omega \in \bigcap_{i_1 \in N} \mathbf{K}_{i_1}\Big(\bigcap_{i_2 \in N} \mathbf{K}_{i_2}\Big(\ldots\Big(\bigcap_{i_{m-1} \in N} \mathbf{K}_{i_{m-1}}\Big(\bigcap_{i_m \in N} \mathbf{K}_{i_m}(A)\Big)\Big)\Big)\Big)$$

so by (2), if (1) is satisfied then $\omega \in \mathbf{K}^{m}_{N}(A)$. □

Supplement to Common Knowledge

Proof of Proposition 2.8

Proposition 2.8.
$\mathbf{L}^*_N(E) \subseteq \mathbf{K}^*_N(E)$, that is, Lewis-common knowledge of *E* implies common knowledge of *E*.

Proof.
Suppose that $\omega \in \mathbf{L}^*_N(E)$. By definition, there is a basis proposition A* such that $\omega \in A^*$. It suffices to show that for each $m \geq 1$ and for all agents $i_1, i_2, \ldots, i_m \in N$,

$$\omega \in \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_m}(E)$$

We prove the result by induction on m. The m = 1 case follows at once from (L1) and (L3). Now if we assume that for m = k, $\omega \in \mathbf{L}^*_N(E)$ implies $\omega \in \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_k}(E)$, then $\mathbf{L}^*_N(E) \subseteq \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_k}(E)$ because ω is an arbitrary possible world, so $\mathbf{K}_{i_1}(A^*) \subseteq \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_k}(E)$ by (L3). Since (L2) is the case and the agents of N are A*-symmetric reasoners,

$$\mathbf{K}_{i_1}(A^*) \subseteq \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_k}(E)$$

for any $i_{k+1} \in N$, so $\omega \in \mathbf{K}_{i_1}\mathbf{K}_{i_2} \ldots \mathbf{K}_{i_k}(E)$ by (L1), which completes the induction since $i_1, i_{k+1}, i_2, \ldots, i_k$ are k + 1 arbitrary agents of N. □

Stanford Encyclopedia of Philosophy
Supplement to Common Knowledge

Proof of Lemma 2.11

Lemma 2.11.
$\omega' \in \mathcal{M}(\omega)$ iff ω' is reachable from ω.

Proof.
Pick an arbitrary world $\omega \in \Omega$, and let

$$\mathcal{R}(\omega) = \bigcup_{n=1}^{\infty} \bigcup_{i_1, i_2, \ldots, i_n \in N} \mathcal{H}_{i_n}(\ldots(\mathcal{H}_{i_2}(\mathcal{H}_{i_1}(\omega)))$$

that is, $\mathcal{R}(\omega)$ is the set of all worlds that are reachable from ω. Clearly, for each $i \in N$, $\mathcal{H}_i(\omega) \subseteq \mathcal{R}(\omega)$, which shows that $\mathcal{R}$ is a coarsening of the partitions $\mathcal{H}_i$, $i \in N$. Hence $\mathcal{M}(\omega) \subseteq \mathcal{R}(\omega)$, as $\mathcal{M}$ is the finest common coarsening of the $\mathcal{H}_i$'s.

We need to show that $\mathcal{R}(\omega) \subseteq \mathcal{M}(\omega)$ to complete the proof. To do this, it suffices to show that for any sequence $i_1, i_2, \ldots, i_n \in N$

$$(1)\ \mathcal{H}_{i_n}(\ldots(\mathcal{H}_{i_2}(\mathcal{H}_{i_1}(\omega)))$$

We will prove (1) by induction on n. By definition, $\mathcal{H}_i(\omega) \subseteq \mathcal{M}(\omega)$ for each $i \in N$, proving (1) for $n = 1$. Suppose now that (1) obtains for $n = k$, and for a given $i \in N$, let $\omega^* \in \mathcal{H}_i(A)$ where $A = \mathcal{H}_{i_k}(\ldots(\mathcal{H}_{i_2}(\mathcal{H}_{i_1}(\omega)))$. By induction hypothesis, $A \subseteq \mathcal{M}(\omega)$. Since $\mathcal{H}_i(A)$ states that i_1 thinks that i_2 thinks that ... i_k thinks that i thinks that ω^* is possible, A and $\mathcal{H}_i(\omega^*)$ must overlap, that is, $\mathcal{H}_i(\omega^*) \cap A \neq \varnothing$. If $\omega^* \notin \mathcal{M}(\omega)$, then $\mathcal{H}_i(\omega^*) \nsubseteq \mathcal{M}(\omega)$, which implies that $\mathcal{M}$ is not a common coarsening of the $\mathcal{H}_i$'s, a contradiction. Hence $\omega^* \in \mathcal{M}(\omega)$, and since i was chosen arbitrarily from N, this shows that (1) obtains for $n = k + 1$. ☐

Supplement to Common Knowledge

Proof of Lemma 2.12

Lemma 2.12.
$\mathcal{M}(\omega)$ is common knowledge for the agents of N at ω.

Proof.
Since $\mathcal{M}$ is a coarsening of $\mathcal{H}_i$ for each $i \in N$, $\mathbf{K}_i(\mathcal{M}(\omega))$. Hence, $\mathbf{K}^1_N(\mathcal{M}(\omega))$, and since by definition $\mathbf{K}_i(\mathcal{M}(\omega)) = \{\omega \mid \mathcal{H}_i(\omega) \subseteq \mathcal{M}(\omega)\} = \mathcal{M}(\omega)$,

$$\mathbf{K}^1_N(\mathcal{M}(\omega)) = \bigcap_{i \in N} \mathbf{K}_i(\mathcal{M}(\omega)) = \mathcal{M}(\omega)$$

Applying the recursive definition of mutual knowledge, for any $m \geq 1$,

$$\mathbf{K}^m_N(\mathcal{M}(\omega)) = \bigcap_{i \in N} \mathbf{K}_i(\mathbf{K}^{m-1}_N(\mathcal{M}(\omega))) = \bigcap_{i \in N} \mathbf{K}_i(\mathcal{M}(\omega)) = \mathcal{M}(\omega)$$

so, since $\omega \in \mathcal{M}(\omega)$, by definition we have $\omega \in \mathbf{K}^*_N(\mathcal{M}(\omega))$. □

Supplement to Common Knowledge

Proof of Proposition 2.13

Proposition 2.13 (Aumann 1976)
Let $\mathcal{M}$ be the meet of the agents' partitions $\mathcal{H}_i$ for each $i \in N$. A proposition $E \subseteq \Omega$ is common knowledge for the agents of N at ω iff $\mathcal{M}(\omega) \subseteq E$. In Aumann (1976), E is *defined* to be common knowledge at ω iff $\mathcal{M}(\omega) \subseteq E$.

Proof.
($\Leftarrow$) By Lemma 2.12, $\mathcal{M}(\omega)$ is common knowledge at ω, so E is common knowledge at ω by Proposition 2.4.

($\Rightarrow$) We must show that $\mathbf{K}^*_N(E)$ implies that $\mathcal{M}(\omega) \subseteq E$. Suppose that there exists $\omega' \in \mathcal{M}(\omega)$ such that $\omega' \notin E$. Since $\omega' \in \mathcal{M}(\omega)$, ω' is reachable from ω, so there exists a sequence 0, 1, . . . , m - 1 with associated states $\omega_1, \omega_2, \ldots, \omega_m$ and information sets $\mathcal{H}_{i_k}(\omega_k)$ such that $\omega_0 = \omega$, $\omega_m = \omega'$, and $\omega_k \in \mathcal{H}_{i_k}(\omega_{k+1})$. But at information set $\mathcal{H}_{i_k}(\omega_m)$, agent i_k does not know event E. Working backwards on k, we see that event E cannot be common knowledge, that is, agent i_1 cannot rule out the possibility that agent i_2 thinks that . . . that agent i_{m-1} thinks that agent i_m does not know E. □

Supplement to Common Knowledge

Proof of Proposition 2.14

Proposition 2.14.
Let C^*_N be the greatest fixed point of f_E. Then $C^*_N(E) = K^*_N(E)$.

Proof.

We have shown that $\mathbf{K}^*_N(E)$ is a fixed point of f_E, so we only need to show that $\mathbf{K}^*_N(E)$ is the greatest fixed point. Let B be a fixed point of f_B. We want to show that $B \subseteq \mathbf{K}^k_N(E)$ for each value $k \geq 1$. We will proceed by induction on k. By hypothesis,

$$B = f_E(B) = \mathbf{K}^1_N(E \cap B) \subseteq \mathbf{K}^1_N(E)$$

by monotonicity, so we have the k=1 case. Now suppose that for k=m, $B \subseteq \mathbf{K}^m_N(E)$. Then by monotonicity,

(i) $\mathbf{K}^1_N(B) \subseteq \mathbf{K}^1_N\mathbf{K}^{\mathrm{m}}_N(E) = \mathbf{K}^{\mathrm{m+1}}_N(E)$

We alo have:

(ii) $B = \mathbf{K}^1_N(E \cap B) \subseteq \mathbf{K}^1_N(B)$

by monotonicity, so combining (i) and (ii) we have:

$B \subseteq \mathbf{K}^1_N(B) \subseteq \mathbf{K}^{\mathrm{m+1}}_N(E)$

completing the induction. □

Supplement to Common Knowledge

Proof of Proposition 3.1

Proposition 3.1.
Let Ω be a finite set of states of the world. Suppose that

> (i) Agents i and j have a common prior probability distribution $\mu(\cdot)$ over the events of Ω such that $\mu(\omega) > 0$ for each $\omega \in \Omega$, and
>
> (ii) It is common knowledge at ω that i's posterior probability of event E is $q_i(E)$ and that j's posterior probability of E is $q_j(E)$.

Then $q_i(E) = q_j(E)$.

Proof.
Let $\mathcal{M}$ be the meet of all the agents' partitions, and let $\mathcal{M}(\omega)$ be the element of $\mathcal{M}$ containing ω. Since $\mathcal{M}(\omega)$ consists of cells common to every agents information partition, we can write

$$\mathcal{M}(\omega) = \bigcup_k H_{ik},$$

where each $H_{ik} \in \mathcal{H}_i$. Since i's posterior probability of event E is common knowledge, it is constant on $\mathcal{M}(\omega)$, and so

$$q_i(E) = \mu(E \mid H_{ik}) \text{ for all } k$$

Hence,

$$\mu(E \cap H_{ik}) = q_i(E)\,\mu(H_{ik})$$

and so

$$\mu(E \cap \mathcal{M}(\omega)) = \mu(E \cap \bigcup_k H_{ik}) = \mu(\bigcup_k E \cap H_{ik})$$

$$= \sum_k \mu(E \cap H_{ik}) = \sum_k q_i(E)\,\mu(H_{ik})$$

$$= q_i(E) \sum_k \mu(H_{ik}) = q_i(E)\,\mu(\bigcup_k H_{ik})$$

$$= q_i(E)\,\mu(\mathcal{M}(\omega))$$

Applying the same argument to j, we have

$$\mu(E \cap \mathcal{M}(\omega)) = q_j(E)\,\mu(\mathcal{M}(\omega))$$

so we must have $q_i(E) = q_j(E)$. □

Proof of Proposition 3.4

Proposition 3.4.
In a game Γ, common knowledge of Bayesian rationality is satisfied if, and only if, (3.i) is common knowledge.

Proof.
Suppose first that common knowledge of Bayesian rationality is satisfied. Since it is common knowledge that agent i knows that agent k is Bayesian rational, it is also common knowledge that if $\mu_i(s_{k\,j}) > 0$, then $s_{k\,j}$ must be optimal for k given some belief over S_{-k} , so (3.i) is common knowledge.

Suppose now that (3.i) is common knowledge. Then, by (3.i), agent i knows that agent k is Bayesian rational. Since (3.i) is common knowledge, all statements of the form `For i, j, . . . , k ∈ N, i knows that j knows that . . . is Bayesian rational' follow by induction. □

Supplement to Common Knowledge

Proof of Proposition 3.7

Proposition 3.7
Assume that the probabilities

$$\boldsymbol{\mu} = (\mu_1, \ldots , \mu_n) \in \Delta_1 (S_{-1}) \times \ldots \times \Delta_n (S_{-n})$$

are common knowledge. Then common knowledge of Bayesian rationality is satisfied if, and only if, $\boldsymbol{\mu}$ is an endogenous correlated equilibrium.

Proof.
Suppose first that common knowledge of Bayesian rationality is satisfied. Then, by Proposition 3.4, for a given agent $k \in N$, if $\mu_i(s_{kj}) > 0$ for each agent $i \neq k$, then s_{kj} must be optimal for k given some distribution $\sigma_k \in \Delta_k (S_{-k})$. Since the agents' distributions are common knowledge, this distribution is precisely μ_k, so (3.iii) is satisfied for k. (3.iii) is similarly established for each other agent $i \neq k$, so $\boldsymbol{\mu}$ is an endogenous correlated equilibrium.

Now suppose that $\boldsymbol{\mu}$ is an endogenous correlated equilibrium. Then, since the distributions are common knowledge, (3.i) is common knowledge, so common knowledge of Bayesian rationality is satisfied by Proposition 3.4.

Supplement to Common Knowledge

Proof of Proposition 3.11

Proposition 3.11 (Aumann 1987)
If each agent $i \in N$ is ω-Bayes rational at each possible world $\omega \in \Omega$, then the agents are following an Aumann correlated equilibrium. If the CPA is satisfied, then the correlated equilibrium is objective.

Proof.
We must show that $s : \Omega \rightarrow S$ as defined by the $\mathcal{H}_i$-measurable s_i's of the Bayesian rational agents is an objective Aumann correlated equilibrium. Let $i \in n$ and $\omega \in \Omega$ be given, and let $g_i : \Omega \rightarrow S_i$ be any function that is a function of s_i. Since s_i is constant over each cell of $\mathcal{H}_i$, g_i must be as well, that is, g_i is $\mathcal{H}_i$-measurable. By Bayesian rationality,

$$E(u_i \circ s \mid \mathcal{H}_i)(\omega) \geq E(u_i(g_i, s_{-i}) \mid \mathcal{H}_i)(\omega)$$

Since ω was chosen arbitrarily, we can take iterated expectations to get

$$E(E(u_i \circ s \mid \mathcal{H}_i)(\omega)) \geq E(E(u_i(g_i, s_{-i}) \mid \mathcal{H}_i)(\omega))$$

which implies that

$$E(u_i \circ s) \geq E(u_i(g_i, s_{-i}))$$

so s is an Aumann correlated equilibrium.

Proof of Proposition 3.12

Proposition 3.12 (Bicchieri 1993)
In an extensive form game of perfect information, the agents follow the backwards induction solution if the following conditions are satisfied for each agent i at each information set I^{ik}:

- i is rational, i knows this and i knows the game, and
- At any information set I^{jk+1} that immediately follows I^{ik}, i knows at I^{ik} what j knows at I^{jk+1}.

Proof.
The proof is by induction on m, the number of potential moves in the game. If m = 1, then at I^{i1}, by (a) agent i chooses a strategy which yields i her maximum payoff, and this is the backwards induction solution for a game with one move.

Now suppose the proposition holds for games having at most m = r potential moves. Let Γ be a game of perfect information with r + 1 potential moves, and suppose that (α) and (β) are satisfied at every node of Γ. Let I^{i1} be the information set corresponding to the root of the tree for Γ. At I^{i1}, i knows that (a) and (b) obtain for each of the subgames that start at the information sets which immediately follow I^{i1}. Then i knows that the outcome of play for each of these subgames is the backwards induction solution for that subgame. Hence, at I^{i1} i's payoff maximizing strategy is a branch of the tree starting from I^{i1} which leads to a subgame whose backwards induction solution is best for i, and since i is rational, i chooses such a branch at I^{i1}. But this is the backwards induction solution for the entire game Γ, so the proposition is proved for m = r + 1.

Rubinstein's Proof

[Note: See Definition 3.2 for the notation used in this proof.]

Let T_2 denote the number of messages that Joanna's e-mail system sends, and T_1 denote the number of messages that Lizzi's e-mail system sends. We might suppose that T_i appears on each agent's computer screen. If $T_1 = 0$, then Lizzi sends no message, that is, ω_1 has occurred, in which case Lizzi's unique best response is to choose *A*. If $T_2 = 0$, then Joanna did not receive a message. She knows that in this case, either ω_1 has occurred and Lizzi did not send her a message, which occurs with probability .51, or ω_2 has occurred and Lizzi sent her a message which did not arrive, which occurs with probability $.49\varepsilon$. If ω_1 has occurred, then Lizzi is sure to choose *A*, so Joanna knows that whatever Lizzi might do at ω_2,

$$\begin{aligned} E(u_2(A) \mid T_2{=}0) &\geq \frac{2(.51) + 0(.49)\varepsilon}{.51 + .49\varepsilon} \\ &> \frac{-4(.51) + 2(.49)\varepsilon}{.51 + .49\varepsilon} \\ &\geq E(u_2(B) \mid T_2{=}0) \end{aligned}$$

so Joanna is strictly better off choosing A no matter what Lizzi does at either state of the world.

Suppose next that for all $T_i < t$, each agents' unique best response given her expectations regarding the other agent is *A*, so that the unique Nash equilibrium of the game is (*A*,*A*). Assume that $T_1 = t$. Lizzi is uncertain whether $T_2 = t$, which is the case if Joanna received Lizzi's t^{th} automatic confirmation and Joanna's t^{th} confirmation was lost, or if $T_2 = t - 1$, which is the case if Lizzi's t^{th} confirmation was lost. Then

$$\begin{aligned} \mu_1(T_2 = t-1 \mid T_1 = t) &= z \\ &= \frac{\varepsilon}{\varepsilon + (1-\varepsilon)\varepsilon} \\ &> \tfrac{1}{2}. \end{aligned}$$

[1]

Thus it is more likely that Lizzi's last confirmation did not arrive than that Joanna did receive this message. By the inductive assumption, Lizzi assesses that Joanna will choose A if $T_2 = t-1$. So

$$\begin{aligned} E(u_1(B) \mid T_1 = t) &\leq -4z + 2(1-z) \\ &= -6z + 2 \\ &< -3 + 2 \\ &= -1, \end{aligned}$$

and

$$E(u_1(A) \mid T_1 = t) = 0$$

since Lizzi knows that ω_2 is the case. So Lizzi's unique best action is A. Similarly, one can show that A is Joanna's best reply if $T_2 = t$. So by induction, (A,A) is the unique Nash equilibrium of the game for every $t \geq 0$.

Notes to Supplement: Rubinstein's Proof

Notes

1. If this does not look immediately obvious, consider that either

> $E = [T_2 = t]$ = my (Lizzi's) t^{th} confirmation was lost,

or

> <em>F = $[T_2 = t]$ = my t^{th} confirmation was received and Joanna's t^{th} confirmation was lost

must occur, and that $\mu_1(T_1 = t \mid E) = \mu_1(T_1 = t \mid F) = 1$ because Lizzi can see her own computer screen, so we can apply Bayes' Theorem as follows:

$$\mu_1(E \mid T_1 = t) = \frac{\mu_1(T_1 = t \mid E)\ \ \mu_1(E)}{\mu_1(T_1 = t \mid E)\ \ \mu_1(E) + \mu_1(T_1 = t \mid F)\ \ \mu_1(F)}$$

$$= \frac{\mu_1(E)}{\mu_1(E) + \mu_1(F)}$$

$$= \frac{\varepsilon}{\varepsilon + (1 - \varepsilon)\varepsilon}$$

Harriet Taylor Mill

> *Were I but capable of interpreting to the world one half the great thoughts and noble feelings which are buried in her grave, I should be the medium of a greater benefit to it, than is ever likely to arise from anything that I can write, unprompted and unassisted by her all but unrivalled wisdom.*
>
> - John Stuart Mill

Harriet Taylor Mill (1807-1858) wrote primarily in the area of social-political philosophy, and had a particular interest in women's rights, but—her essay, "The Enfranchisement of Women" notwithstanding—the body of work that she penned is probably not substantial enough for her to be judged a major figure in the history of philosophy on the basis of it alone. However, John Stuart Mill, her second husband, not only lavished praise on her intellect, emotional depth, and moral character, but also credited her with exerting a tremendous influence on his thought, with making major intellectual contributions to many of the works published in his name, and even with having been intimately involved in the composition of some of his most important works. Today scholars debate how much of a difference she really made to 'his' corpus, whether whatever effect she had on it was an improving one, and whether she even came close to meriting the lavish praise that he heaped on her in passages such as the one quoted above from the dedication to *On Liberty* (J. S. Mill 1977, p. 216).

---

1. Life and Character

The woman who is today most commonly known as Harriet Taylor Mill (hereafter HTM) was born Harriet Hardy in London in October 1807. She married the pharmaceuticals wholesaler John Taylor on 14 March 1826; she was eighteen, and he was twenty nine. The couple had three children together: Herbert, born in 1827; Algernon ("Haji"), born in 1830; and Helen ("Lily"), born in 1831. John Taylor died of cancer in 1849, and in the Spring of 1851 Harriet Taylor married again, this time to John Stuart Mill (hereafter JSM). A tuberculosis sufferer, as was JSM (it is possible that she caught the disease, then called "consumption," from him), she died of a respiratory failure on 3 November 1858.

HTM and JSM met for the first time in 1830. Their meeting was arranged by the leader of HTM's Unitarian congregation, the Reverend W. J. Fox, to whom she had complained about John Taylor's lack of interest in philosophy and the arts. Of course there is no way to know if Fox anticipated that passionate feelings would spring up between JSM and HTM, although Josephine Kamm speculates that Fox, who was already married, might have sought to eliminate JSM as a competitor for the attentions of his soon-to-be mistress Eliza Flower (1977, 29f.). Whether this was Fox's intention or not, the two young people did very quickly fall in love.

Their conduct during the long period in which HTM was Mrs. John Taylor was quite scandalous by Victorian standards. Early on JSM would frequently, indeed almost nightly, visit the Taylors' home; John Taylor would usually facilitate these visits by going to his club. On the whole, John Taylor was remarkably tolerant of the fact that his wife, to whom he was utterly devoted, was on the most intimate of terms with another man, but his tolerance did have some limits. In 1833, at his insistence, HTM established a separate residence, and she lived apart from John Taylor for most of the rest of his life, seeing Mill at her convenience (Helen lived with her, Herbert and Haji with their father). In 1848 Taylor refused to allow JSM to dedicate *The Principles of Political Economy* to HTM, although the dedication was inserted into copies of the book that they distributed to friends. In 1849 John Taylor began to suffer from the cancer that would eventually take his life, and he asked HTM to return home to care for him. She declined, on the grounds that her first duty was to JSM, who at the time was suffering himself from an injured hip and temporary near-blindness. While JSM eventually mended John Taylor's condition only worsened, and at the end HTM did dedicate herself to caring for her husband. In fact, she rebuked JSM very sharply for having failed, while paying her a short visit, to ask about John Taylor's condition. She upbraided him even more severely for having suggested that she might write to him during an "odd time" when she might find a "change of subject of thought a relief": "Good God, sh[oul]d you think it a relief to think of something else some acquaintance or what not while *I* was dying?" (H. T. Mill 1998, 360).

After John Taylor's death in 1849, JSM and HTM waited nearly two years before marrying. They had already largely withdrawn from society, due perhaps to the gossip that their relationship generated. After their marriage they spent much of their time in their Blackheath Park home with just Haji and Helen Taylor for company (although JSM did still go to work each day at the India House). JSM was so excessively sensitive to any perceived slight of his wife that he never forgave his mother and sisters for their failure to call on her immediately after being told of his impending nuptials. (When one bears in mind that he had not allowed his family to make any mention of HTM to that point one can understand why, out of their eagerness to please him, they had waited for instructions before doing anything.) The Mills did sometimes interrupt their reclusion to travel, separately or together, to the south of England or to

the Continent in pursuit of a more healthful climate. In the Fall of 1858 they set out for Montpellier, but HTM's fragile health gave out in Avignon. JSM bought a small house there, next to the cemetery in which she was buried, where he spent a considerable portion of the remainder of his life. He died and was buried in Avignon in May 1873.

There have always been questions about the sexual dimension of the Mills' relationship, or rather about whether it *had* such a dimension. The most interesting question to many of their contemporaries was no doubt that of whether they were sexually involved prior to the death of John Taylor. They adamantly denied this. In his *Autobiography* JSM wrote that:

> …our relation to each other at that time was one of strong affection and confidential intimacy only. For though we did not consider the ordinances of society binding on a subject so entirely personal, we did feel bound that our conduct should be such as in no degree to bring discredit on her husband, nor therefore on herself. (J. S. Mill 1981, 237.)

Their private correspondence seems to bear this out (see for example H. T. Mill 1998, 375).

Today there is probably more interest in whether the Mills had a sexual relationship *after* their marriage, a question that—however sordid and trivial it may appear—could bear on the serious matter of their views about sexuality. Some of their comments could be taken to suggest that the sex act is inherently degrading and that sexual gratification has no value (see for example J. S. Mill 1984, 285—Mill is writing specifically about rape in this passage, but he seems to imply that in every instance the "animal function" of coitus is abjective—and H. T. Mill 1998, 18, 226). Of course, they could have had non-philosophical reasons for failing to consummate their marriage. Sheer lack of interest is one obvious explanation; additionally, commentators have speculated both that JSM might have been impotent (Kamm 1977, 41) and that HTM might have contracted syphilis from her first husband (Jacobs 1998, xxx-xxxii). This is, in any case, a question to which we are unlikely to find a definitive answer.

HTM's contemporaries offer radically different impressions of her as a person. JSM's view is already fairly clear from the lines from the dedication to *On Liberty* that were quoted above, but in a venue free from the normal restrictions on length his description of her in his *Autobiography* really is worth quoting in full:

> Although it was years after my introduction to Mrs. Taylor before my acquaintance with her became at all intimate or confidential, I very soon felt her to be the most admirable person I had ever known. It is not to be supposed that she was, or that any one, at the age at which I first saw her, could be, all that she afterwards became. Least of all could this be true of her, with whom self-improvement, progress in the highest and in all senses, was a law of her nature; a necessity equally from the ardour with which she sought it, and from the spontaneous tendency of faculties which could not receive an impression or an experience without making it the source or the occasion of an accession of wisdom. Up to the time when I first saw her, her rich and powerful nature had chiefly unfolded itself according to the received type of feminine genius. To her outer circle she was a beauty and

a wit, with an air of natural distinction, felt by all who approached her: to the inner, a woman of deep and strong feeling, of penetrating and intuitive intelligence, and of an eminently meditative and poetic nature. Married at a very early age, to a most upright, brave, and honourable man, of liberal opinions and good education, but without the intellectual or artistic tastes which would have made him a companion for her, though a steady and affectionate friend, for whom she had true esteem and the strongest affection through life, and whom she most deeply lamented when dead; shut out by the social disabilities of women from any adequate exercise of her highest faculties in action on the world without; her life was one of inward meditation, varied by familiar intercourse with a small circle of friends, of whom one only (long since deceased) was a person of genius,[1] or of capacities of feeling or intellect kindred with her own, but all had more or less of alliance with her in sentiments and opinions. Into this circle I had the good fortune to be admitted, and I soon perceived that she possessed in combination, the qualities which in all other persons whom I had known I had been only too happy to find singly. In her, complete emancipation from every kind of superstition (including that which attributes a pretended perfection to the order of nature and the universe), and an earnest protest against many things which are still part of the established constitution of society, resulted not from the hard intellect, but from strength of noble and elevated feeling, and co-existed with a highly reverential nature. In general spiritual characteristics, as well as in temperament and organisation, I have often compared her, as she was at this time, to Shelley: but in thought and intellect, Shelley, so far as his powers were developed in his short life, was but a child compared with what she ultimately became. Alike in the highest regions of speculation and in the smaller practical concerns of daily life, her mind was the same perfect instrument, piercing to the very heart and marrow of the matter; always seizing the essential idea or principle. The same exactness and rapidity of operation, pervading as it did her sensitive as well as her mental faculties, would, with her gifts of feeling and imagination, have fitted her to be a consummate artist, as her fiery and tender soul and her vigorous eloquence would certainly have made her a great orator, and her profound knowledge of human nature and discernment and sagacity in practical life, would, in the times when such a *carriére* was open to women, have made her eminent among the rulers of mankind. Her intellectual gifts did but minister to a moral character at once the noblest and the best balanced which I have ever met with in life. Her unselfishness was not that of a taught system of duties, but of a heart which thoroughly identified itself with the feelings of others, and often went to excess in consideration for them by imaginatively investing their feelings with the intensity of its own. The passion of justice might have been thought to be her strongest feeling, but for her boundless generosity, and a lovingness ever ready to pour itself forth upon any or all human beings who were capable of giving the smallest feeling in return. The rest of her moral characteristics were such as naturally accompany these qualities of mind and heart: the most genuine modesty combined with the loftiest pride; a simplicity and sincerity which were absolute, towards all who were fit to receive them; the utmost scorn of whatever was mean and cowardly, and a burning indignation at everything brutal or tyrannical, faithless or dishonourable in conduct and character, while making the broadest distinction between *mala in se* and mere *mala prohibita*—between acts giving evidence of intrinsic badness in

> feeling and character, and those which are only violations of conventions either good or bad, violations which whether in themselves right or wrong, are capable of being committed by persons in every other respect lovable or admirable (J. S. Mill 1981, 193-7).

No one else who knew HTM personally spoke of her in anything like these terms, as far as we know, and indeed several of her contemporaries held her in low estimation. The Carlyles were admirers initially, but soon had changes of heart. Jane said that HTM was "a peculiarly affected body" who "was not easy unless she startled you with unexpected sayings," and was in fact "somewhat of a humbug" (quoted in Packe 1954, 325f). Thomas said that "She was full of unwise intellect, asking and re-asking stupid questions" (quoted in Packe 1954, 315). Harold Laski related that "Morley told me that Louis Blanc told him that he once sat for an hour with her and that she repeated to him what afterwards turned out to be an article that Mill had just finished for the *Edinburgh*. … If she was what he thought, someone at least should have given us indications" (quoted in Stillinger 1961, 24f).

There is, of course, a vast middle territory between these extremes, and it seems highly plausible that the truth about HTM lies somewhere within it. We certainly do not want to make the mistake of uncritically accepting the reports of the notoriously catty Carlyles. But at the same time we have clear evidence that JSM was unable to be absolutely objective where HTM was concerned. His description of her character, for example, leaves absolutely no room for vanity, yet HTM clearly was vain, if not, as Diana Trilling adds, also "prideful" and "mean-spirited" (1952, 120). Although it is important not to make this fault seem any more significant than it would in reference to a male philosopher, only a vain person would have allowed her husband to write a passage about her like the one that appeared in JSM's *Autobiography* (this passage was drafted in HTM's lifetime and she did help to edit the manuscript—on this see JSM 1981, xix).[2] Of course, because JSM's praise for HTM is so hyperbolic, to say that she was a little less gifted or marvelous than he took her to be is not necessarily to denigrate her; it is perfectly consistent with her being a singular person in every respect. She was not often described in judicious or balanced terms, but JSM's brother George, who knew her reasonably well, did relate to JSM's disciple and biographer Alexander Bain that "Mrs. Taylor was a clever and remarkable woman, but nothing like what John took her to be" (Bain 1882, 166).

2. Philosophical Contributions

2.1 Harriet Taylor Mill's Writings

Determining what philosophical contributions HTM made and assessing their value is extremely challenging. The problem is that HTM's close relationship with JSM makes it difficult to say how much responsibility each bears for the work that they collectively produced. It is not always clear how much each of them actually contributed to the writing of some works, and even where this does seem clear it is often unclear which of the ideas each of them contributed. We do know that HTM composed relatively few works herself (relative, at least, to JSM), and not all of her writings were really philosophical in nature; her longest piece, for example, was an essay on William Caxton and the history of printing, which was part of a collection published in 1833 by the Society for the Diffusion of Useful Knowledge (H. T.

Mill 1998, 238-91). Some poems, book reviews, and an essay on the aesthetic appreciation of the seasons were published in the *Monthly Repository* in the early 1830s, when Fox was its editor. She is usually credited with having written “The Enfranchisement of Women,” published in *The Westminster Review* in 1851 (the only reason for any doubt is that JSM did on one occasion describe it to the *Westminster*’s editor as his own, although he later attributed it to her). In it HTM maintains that to remove restrictions on women’s political participation and choice of occupations would not only promote their interests and improve their characters but would do the same for men; this essay contains many of the same lines of argument as *The Subjection of Women*, written by JSM and published in 1869 (although some interpreters take it to express a slightly more radical view of gender roles than the later essay; see Rossi 1970, 41-3). The recently published volume *The Complete Works of Harriet Taylor Mill* also includes some unpublished essays and fragments of essays written by HTM; the topics include women’s rights, the obligation to obey laws that one thinks are unjust, the role of proverbs in moral education, and toleration. These pieces are generally very short, however, and many are just fragments.

2.2 John Stuart Mill’s Assessment of Harriet Taylor Mill

HTM’s collaboration with JSM, however, makes it impossible to reach any judgment about her importance in the history of philosophy simply on the basis of what she herself wrote. As he observed:

> When two persons have their thoughts and speculations completely in common; when all subjects of intellectual or moral interest are discussed between them in daily life, and probed to much greater depths than are usually or conveniently sounded in writings intended for general readers; when they set out from the same principles, and arrive at their conclusions by processes pursued jointly, it is of little consequence in respect to the question of originality, which of them holds the pen; the one who contributes least to the composition may contribute most to the thought; the writings which result are the joint product of both, and it must often be impossible to disentangle their respective parts, and affirm that this belongs to one and that to the other (J. S. Mill 1981, 251).

So while JSM implicitly acknowledged that his hand held the pen most often, when he and HTM collaborated, he also suggested that she contributed ideas to works that he was solely or primarily responsible for composing. “In this wide sense,” he continues, “not only during the years of our married life, but during many of the years of confidential friendship which preceded it, all my published writings were as much my wife's work as mine; her share in them constantly increasing as years advanced” (1981, 251). (Of course, this point cuts both ways. It also entails that we cannot uncritically assume that HTM was the source of all of the ideas in anything *she* penned, including “The Enfranchisement of Women.”)

JSM related that most of the ideas that HTM contributed to their joint work were at either the highest or the lowest levels of abstraction, where she particularly excelled as a thinker:

> With those who, like all the best and wisest of mankind, are dissatisfied with human life as it is, and whose feelings are wholly identified with its radical amendment, there are two

> main regions of thought. One is the region of ultimate aims; the constituent elements of the highest realizable ideal of human life. The other is that of the immediately useful and practically attainable.[3] In both these departments, I have acquired more from her teaching, than from all other sources taken together (1981, 197).

While HTM's strengths were in the most abstract and practical realms of thought, JSM took his own strength to lie in "the uncertain and slippery intermediate region, that of theory, or moral and political science," including "political economy, analytic psychology, logic, philosophy of history," etc. He acknowledged that HTM had very little to do with his first major work, *A System of Logic* (first published in 1843), or with his discussions of the more technical aspects of political economy. But much of his philosophical output, he suggested, conveyed her thoughts:

> During the greater part of my literary life I have performed the office in relation to her, which from a rather early period I had considered as the most useful part that I was qualified to take in the domain of thought, that of an interpreter of original thinkers, and mediator between them and the public; for I had always a humble opinion of my own powers as an original thinker, except in abstract science … but thought myself much superior to most of my contemporaries in willingness and ability to learn from everybody…. I had, in consequence, marked out this as a sphere of usefulness in which I was under a special obligation to make myself active: the more so, as the acquaintance I had formed with the ideas of the Coleridgians, of the German thinkers, and of Carlyle, all of them fiercely opposed to the mode of thought in which I had been brought up, had convinced me that along with much error they possessed much truth…. Thus prepared, it will easily be believed that when I came into close intellectual communion with a person of the most eminent faculties, whose genius, as it grew and unfolded itself in thought, continually struck out truths far in advance of me, but in which I could not, as I had done in those others, detect any mixture of error, the greatest part of my mental growth consisted in the assimilation of those truths, and the most valuable part of my intellectual work was in building the bridges and clearing the paths which connected them with my general system of thought (1981, pp. 251ff).

Moreover, there are two major works published in JSM's name of which he said that HTM was a co-author in the narrower sense of having been heavily involved in their actual composition. One is the *Principles of Political Economy*. The full title of this book is *The Principles of Political Economy, With Some of Their Applications to Social Philosophy*, and it was the portion of the book dealing with social philosophy that HTM helped to shape. This is especially true with respect to one chapter in particular, the one titled "On the Probable Futurity of the Working Classes." This chapter argues that when they have made enough moral and intellectual progress the working classes can be expected to refuse to settle for mere wages; they will instead insist on arrangements in which they cooperatively own the firms for which they labor, and will at least experiment with Socialist and Communist communities of the sorts depicted by Saint-Simon, Fourier, Blanc, and Owen. JSM wrote that:

> In the first draft of the book, that chapter did not exist. She pointed out the need of such a

> chapter, and the extreme imperfection of the book without it: she was the cause of my writing it; and the more general part of the chapter, the statement and discussion of the two opposite theories respecting the proper condition of the labouring classes, was wholly an exposition of her thoughts, often in words taken from her own lips. The purely scientific part of the Political Economy I did not learn from her; but it was chiefly her influence that gave to the book that general tone by which it is distinguished from all previous expositions of Political Economy that had any pretension to being scientific, and which has made it so useful in conciliating minds which those previous expositions had repelled…. The economic generalizations which depend, not on necessities of nature but on those combined with the existing arrangements of society, it deals with only as provisional, and as liable to be much altered by the progress of social improvement. I had indeed partially learnt this view of things from the thoughts awakened in me by the speculations of the St. Simonians; but it was made a living principle pervading and animating the book by my wife's promptings (1981, 255ff).

HTM also played an active role in the process of revising later editions of the *Principles*. For example, the second (1849) edition was considerably more favorable to Socialism and even Communism, and this largely seems to reflect a change in HTM’s thinking that JSM came to share as a result of her persuasion. In a letter written to HTM early in 1849, JSM pointed out that she now “had marked dissent” from a passage in the first edition raising an objection to Communism that “was inserted on your proposition & very nearly in your own words.” He continued:

> This is probably only the progress we have always been making, & by thinking sufficiently I should probably come to think the same—as is almost always the case, I believe always when we think long enough (Hayek 1951, pp. 134f).

The other major work of which JSM says that HTM ought to be considered a co-author in the narrow sense is the essay *On Liberty*, which was published in the year after her death. The dedication of this essay, a portion of which has already been quoted, says that “Like all that I have written for many years, it belongs as much to her as to me,” and Mill later elaborated on HTM’s role in the essay’s production:

> The “Liberty” was more directly and literally our joint production than anything else which bears my name, for there was not a sentence of it that was not several times gone through by us together, turned over in many ways, and carefully weeded of any faults, either in thought or expression, that we detected in it…. With regard to the thoughts, it is difficult to identify any particular part or element as being more hers than all the rest. The whole mode of thinking of which the book was the expression, was emphatically hers…. The “Liberty” is likely to survive longer than anything else that I have written (with the possible exception of the “Logic”), because the conjunction of her mind with mine has rendered it a kind of philosophic text-book of a single truth… (1981, 257ff).[4]

2.3 The Countervailing Assessment

But just as there is doubt about whether HTM was really the person that JSM made her out to be, so too is there doubt about how valuable she really was to him as an intellectual partner source of ideas. H. O. Pappe, for example, concludes his monograph *John Stuart Mill and the Harriet Taylor Myth* by questioning whether HTM introduced any substantial alterations into the pattern of JSM's thought:

> [Harriet's] early writings evince her dependence on Mill. For the later period of their partnership we have no valid evidence to show that Harriet turned Mill's mind toward new horizons or gave an unexpected significance to his thought…. Mill without Harriet would still have been Mill. Mill married to George Eliot (or to Mary Wollstonecraft—permitting the anachronism) might have been transformed. Mary Ann Evans might have given him something new by way of independent thought and deeper feeling. Yet, considering her equality of stature, there would have been no need for him in masochistic guilt to magnify her contribution (1960, 47f).

Similarly, Francis Mineka says that "Neither he [JSM] nor his recent biographers have convinced us that she was the originating mind behind his work …." (1963, 306). Other commentators are willing to concede that HTM did exert a considerable influence over the direction of JSM's thought, but allege that her impact was decidedly for the worse, i.e., that she persuaded him to adopt positions that are rather obviously weaker than contrary ones that would otherwise have held—or, indeed, worse than positions he did hold during the periods at the beginning and/or end of his intellectual career when she was not in a position of 'ascendancy' over him. Gertrude Himmelfarb makes this claim explicitly in her characterization of HTM's influence on JSM's views on liberty (1974), and it may be implicit in the celebrated free market economist Friedrich Hayek's account of her influence on his views on Socialism (1951).

Those who argue that HTM was something less than what JSM took her to be, and that he was even mistaken about her role in their intellectual partnership, must explain how he was so misled. There is a tradition of stating that, in essence, he fell victim to her "feminine wiles." It was commonly held among their contemporaries that, as Bain observes, "she imbibed all his views, and gave them back in her own form, by which he was flattered and pleased" (1882, 173). Ruth Borchard says that "Accustomed by training and experience to the acceptance of ascetic, masculine values, he was completely overpowered by her intensely feminine atmosphere" (1957, 46). And Laski speculates: "I should guess that she was a comfortable and sympathetic person and that Mill, brought up to fight Austin, Praed, Macaulay and Grote, had never met a really soft cushion before." (*op. cit.*). Some writers have even advanced the idea that after the death of his domineering father James Mill, JSM felt a need to invent another parental authority in order that he might submit to it (e.g., Trilling 1952, 118; Mazlish 1975, 286ff). Recently, Jo Ellen Jacobs has been outspoken in denying both that HTM lacked influence over Mill and that this influence had any other basis than his appreciation of her superb intellect. She writes that JSM "was a big boy and could evaluate her reasoning" (1998, xv), and claims that the failure of HTM's critics to recognize that she possessed a first-rate mind and that she engaged in genuine collaboration with JSM on roughly equal terms is largely due to sexism.

2.4 A More Balanced Perspective

The available evidence somewhat underdetermines judgments about the value to JSM of his collaboration with HTM. Too much of their collaborative activity took the form of conversations behind closed doors, of which we have no record. When one of them was traveling then they did correspond, but few of HTM's letters survive (and Jack Stillinger remarks on "how seldom *ideas* are touched on" in the correspondence between them that we do have (1961, 26)). As with the descriptions of HTM's character and ability discussed above, the proposition that the truth about the nature of the Mills' intellectual partnership lies somewhere between some of the more extreme views that have been advanced is intuitively very plausible, and it is at least consistent with the evidence. One such intermediate view of their collaboratory activity is that of Bain, who suggests that just as JSM's friend John Sterling "overflowed in suggestive talk, which Mill took up and improved in his own way," so HTM might have done as well (1882, 173ff). If this was HTM's role, then her contribution might largely have taken the form of articulating and passionately advocating certain progressive social and political views—Socialism, women's rights, an absolutist stance about individual liberty—for which JSM then applied himself to developing sophisticated utilitarian arguments. JSM's statement that his task was that of "building the bridges and clearing the paths which connected" HTM's "truths" with his "general system of thought" can be read as implying that this was the case. Of course, it is the strength of those arguments—which is in part a function of the attractiveness of that general system of thought—on which JSM's claim to be regarded as a major figure in the field of social-political philosophy rests. This is not necessarily to say that he held these positions only because she did, which he explicitly told us was not the case with respect to women's rights (1881, 253n), but only that her strong attachment to them was an important part of his motivation for writing about them.

But even if this was her role, she must have been able to talk about those positions in an intelligent manner, to make them seem reasonable; otherwise JSM would never have been moved to try and make a case for them. At the very least, HTM surely did more than simply declare herself a Socialist, a radical (for the time) feminist, etc. Bain knew JSM extremely well, and even though he says that his friend was under "an extraordinary hallucination as to the personal qualities of his wife," and "outraged all reasonable credibility in describing her matchless genius," he is also adamant not only that JSM "was not such an egoist as to be captivated by the echo of his own opinions" but also that he would only have been stimulated by someone with "independent resources" who had a "good mutual understanding as to the proper conditions of the problem at issue" (1882, 173f). If HTM's primary contribution was that of stimulating JSM by "suggestive talk," then her suggestive talk very likely included the idea that the social and political reforms she favored could help to foster the improvement of mankind. John Robson, the editor of JSM's *Collected Works* and author of a book on JSM titled *The Improvement of Mankind*, comments that "[I]n what we have of her writings, Harriet constantly has her eye on the future, even when criticizing the present; she was a woman of dreams and aspirations, and she must constantly have breathed into Mill a hopeful and expansive view of human possibilities" (1966, 178). JSM's defenses of Socialism, women's rights, and liberty were progressive not only in the sense that were in advance of Victorian opinion, but also in the sense of being grounded on a conception of "man as a progressive being" (1977, 224). Each was presented as a way of securing the necessary conditions for the moral and intellectual development of humanity, and JSM continually asserted that in the absence of this

development the species would enjoy only a small fraction of the happiness of which it is capable. HTM's encouragement may have been largely responsible for the fact that the proposition that human improvement is desirable, and that in the right social and political context it is possible, loomed so large in his thought. If this is correct, then even if HTM bears little responsibility for the specifics of JSM's arguments for the social and political institutions and practices that she advocated—arguments on which much of his philosophical reputation rests—she would still be responsible not only for inspiring him to make those arguments but also for the fact that they have the general character they do.

Notes to Harriet Taylor Mill

Notes

1. Eliza Flower.

2. For purposes of comparison, note that Alexander Bain convinced Helen Taylor, who prepared the manuscript of Mill's *Autobiography* for publication after his death, to strike some passages about her that were almost as laudatory. When the book was first published, the lines in question were replaced by strings of asterisks; they have been replaced in most contemporary editions (see Robson and Stillinger 1981, xxix n55). Bain also urged Helen to delete some parts of JSM's description of HTM, but she decided against this.

3. In *The Subjection of Women* JSM writes:

> Hardly anything can be of greater value to a man of theory and speculation who employs himself not in collecting materials of knowledge by observation, but in working them up by processes of thought into comprehensive truths of science and laws of conduct, than to carry on his speculations in the companionship, and under the criticism, of a really superior woman. There is nothing comparable to it for keeping his thoughts within the limits of real things, and the actual facts of nature. A woman seldom runs wild after an abstraction. The habitual direction of her mind to dealing with things as individuals rather than in groups, and (what is closely connected with it) her more lively interest in the present feelings of persons, which makes her consider first of all, in anything which claims to be applied to practice, in what manner persons will be affected by it—these two things make her extremely unlikely to put faith in any speculation which loses sight of individuals, and deals with things as if they existed for the benefit of some imaginary entity, some mere creation of the mind, not resolvable into the feelings of living beings. Women's thoughts are thus as useful in giving reality to those of thinking men, as men's thoughts in giving width and largeness to those of women. In depth, as distinguished from breadth, I greatly doubt if even now, women, compared with men, are at any disadvantage (1984, 306).

It is not exactly clear what of this nature JSM thinks that HTM added to his social and political thought, however. John Robson writes of the passage from the *Autobiography* that:

> Perhaps he means nothing more unusual than that one can quickly see whether one's actions fulfill one's intentions in the daily concerns of life. He may also be merely referring to his pronounced inability to manage such practical matters as ordering groceries

> and dealing with difficult neighbors, for here his reliance on her was unusual, and will become notorious…. (1966, 179).

4. JSM prepared a comprehensive bibliography of his publications, in which a number of works are described as "joint productions" with HTM—of some of these he even notes that "very little" in them was his, or that he "acted chiefly as amanuensis to my wife"). Many of these are newspaper articles, most of which concern domestic violence. *The Principles of Political Economy* is also described as a joint production. Interestingly, Mill's bibliography does *not* list *On Liberty* as a joint production.

Personal Autonomy

To be autonomous is to be a law to oneself; autonomous agents are self-governing agents. Most of us want to be autonomous because we want to be accountable for what we do, and because it seems that if we are not the ones calling the shots, then we cannot be accountable. More importantly, perhaps, the value of autonomy is tied to the value of self-integration. We don't want to be alien to, or at war with, ourselves; and it seems that when our intentions are not under our own control, we suffer from self-alienation. What conditions must be satisfied in order to ensure that we govern ourselves when we act? Philosophers have offered a wide range of competing answers to this question.

Introduction

When people living in some region of the world declare that their group has the right to live autonomously, they are saying that they ought to be allowed to govern themselves. In making this claim, they are, in essence, rejecting the political and legal authority of those not in their group. They are insisting that whatever power these outsiders may have over them, this power is illegitimate; they, and they alone, have the authority to determine and enforce the rules and policies that govern their lives.

When an individual makes a similar declaration about some sphere of her own life, she, too, is denying that anyone else has the authority to control her activity within this sphere; she is saying that any exercise of power over this activity is illegitimate unless she authorizes it herself. Most of the reasons that can be offered in support of this claim have correlates in the case of demands for group autonomy. But there is one very important exception: a reason that takes us beyond politics, to the metaphysics of agency.

An agent is one who acts. In order to act, one must initiate one's action. And one cannot initiate one's action without exercising one's power to do so. Since nothing and no one has the power to act except the agent herself, she alone is entitled to exercise this power, if she is entitled to act. This means that insofar as someone is an agent—i.e., insofar as she is one who acts—she is correct to regard her own commitments to acting, her own judgments and decisions about how she should act, as authoritative. Indeed, if she were to challenge the authority that is an essential feature of her judgments and decisions, then they would cease to be her own practical conclusions. Their power to move her would cease to be a manifestation of her power to move herself; it would not be the power of her own agency.

In short, every agent has an authority over herself that is grounded, not in her political or social role, nor in any law or custom, but in the simple fact that she alone can initiate her actions. To be sure, it might be unwise for someone to follow the commands she gives to herself when she "makes up her mind." The point, however, is that she has no conceivable option. In order to form an intention to do one thing rather than another, an agent must regard her own judgment about how to act as authoritative—even if it is only the judgment that she should follow the command or advice of someone else. This tight connection between being an agent and having authority has no correlate in cases where the authority at issue is political. Anyone can coherently (and often plausibly) challenge the political authority of some individual or group. Even a political leader herself can with good reason believe that her political power is illegitimate, and that exercising this power is unjustified.

Despite the special inalienable nature of our authority over ourselves, it is possible for us to fail to govern ourselves, just as it is possible for a political leader to fail to govern those who fall within her domain. Indeed, precisely because our authority over our own actions is a formal feature of agency, our deference to this authority is but the form of self-government. It does not imply that whenever we act, the forces that move us are manifestations of our power as agents; the power of our motives is not necessarily an expression of the decision-making power that is constitutive of our agency, and the basis of our authority to decide how to act. Just as a political leader's official status is compatible with her having no real power to call the shots, so too, a person can have an authoritative status with respect to her motives without having any real power over what she does. Though it is an agent's job to determine how she will act, she can do this job without really being in control. Of course, no one can govern herself without being subject to influences whose power does not derive from her own authority: everything we do is a response to past and present circumstances over which we have no control. But some of these influences are different. Some of the forces that move us to act do not merely affect which actions we choose to perform, nor how we govern ourselves in making these choices. They influence us in a way that makes a mockery of our authority over our actions. They undermine our autonomy.

What distinguishes autonomy-undermining influences on a person's will from those motivating forces that merely play a role in the self-governing process? This is the question that all accounts of autonomy try to answer. As the number and variety of these accounts indicate, the distinction is extremely elusive. There is certainly widespread agreement about the paradigm threats to personal autonomy: brainwashing and addiction are the favorite examples in the philosophical literature. But philosophers seem unable to reach a consensus about the precise nature of these threats. They cannot agree about how it is that certain

influences on our behavior prevent us from governing ourselves.

This disagreement about the defining characteristics of autonomous agency reflects the fact that even as concrete examples call attention to a very real difference between those who govern themselves and those who do not, there are significant conceptual obstacles to making sense of this distinction. These obstacles are tied to the very feature of agency mentioned above—the feature that appears to support the demand that individuals be granted considerable political and legal power. If an agent fails to govern herself, this must be because, at the time, she lacks the power to do so. But in what can this powerlessness consist? If she necessarily has the authority to determine how she will act, and if this essential feature of agency is inseparable from the fact that she necessarily defers to herself whenever she initiates her action, then how can her behavior possibly escape her control? Intuitively, agents can fall under the sway of desires, or urges, or compulsions whose power is at odds with their power as agents; they can be moved by such impulses "in spite of themselves." But in what sense, exactly, are such motives "external" to the agent herself? How can their power to cause her to act fail to be a manifestation of her power to act?

The puzzle at the heart of these questions is a puzzle about the relationship between the agent's power and the power of the forces that move her. And it is a puzzle about the relationship between the agent's authority and the status of these motivating forces. What distinguishes motives whose power is attributable to the agent herself from motives whose power is external to the agent's? What distinguishes motives on which the agent has conferred her authority from motives whose power has reduced her authorization to a mere formality? When the governing agent and the agent she governs are the very same self, we cannot answer either of these questions without answering the other. This is why it is so difficult to produce a satisfactory account of personal autonomy.

(Again, the perplexity to which these questions give voice does not have a correlate in the political case. We can easily grasp the idea of a country's army (or legislative body, or cabinet ministers) dictating to the president what legislation he must approve; for in this case there are (at least) two independently identifiable decision-makers—each with its own point of view, each with its own power. The difficulty in the case where the relevant powers are all within the psyche of the individual agent is that there is no such independently identifiable pair of standpoints in terms of which we can distinguish the powers that bully the agent from the powers that can be attributed to the agent herself. An account of the conditions under which an individual agent is bullied by her motives is, at the same time, an account of what makes a motive external to the agent's own standpoint.)

Four More or Less Overlapping Approaches to Personal Autonomy

Philosophers have proposed many different accounts of the autonomous agent's special relation to her own motives. According to one prominent approach, which one might call coherentist, the governing self in this relation is represented by reflexive attitudes—"higher-order" attitudes toward the mental states

that move her to act.[1] Someone is an autonomous agent, the coherentists argue, if and only if she accepts her motives, or identifies with them, or approves of them, or believes that they make sense in terms of her long term commitments or plans. Intuitively, if someone repudiates the causal efficacy of her own motives, then their power is independent of her authority. If, on the other hand, she endorses these motives, then her actions occur with her permission, if not necessarily at her command. In the second case, the motives are truly her own; in the first case, they are external forces in conflict with her own causal powers.

On a strict coherentist approach to autonomy, autonomous agents can be moved by desires they are helpless to resist: though an addict fails to govern herself if she would rather resist her irresistible urge to take drugs, she is an autonomous agent if she has no objection to her addiction and its motivational effects. According to the coherentist, moreover, both the origin and the content of a person's higher-order attitudes are irrelevant to whether she is an autonomous agent. She need have done nothing to bring it about that she has these attitudes; and the attitudes need not be especially rational or well-informed. Coherentist accounts are thus doubly internalist. They express the intuition that whether we govern ourselves depends on neither how we came to be who we are (a fact that is external to the action itself) nor how our beliefs and attitudes relate to reality (a fact that is external to the beliefs and attitudes themselves). There need be no special relation between our autonomy-constituting attitudes and either the past circumstances that caused these attitudes or the present circumstances in response to which they move us to act.

Other accounts of autonomy introduce conditions that are externalist in one or both of these ways. According to those who advocate a reasons-responsive conception of autonomous agency, an agent does not really govern herself unless her motives, or the mental processes that produce them, are responsive to a sufficiently wide range of reasons for and against behaving as she does.[2] On accounts of this type, an agent who is unresponsive to the reasons for “standing behind,” or “backing up,” certain motives and not others is not in the proper position to authorize her own actions. Whether the relevant reasons are grounded in facts about her own desires and interests, or whether they have some independent source, the idea is that someone is not qualified to govern herself if she cannot understand what she has reason to do, or (if this is a distinct handicap) is incapable of being moved by these reasons. In effect, her exercise of authority is so ill-conceived that it is powerless to confer legitimacy on her motives.

The feature of this account that most distinguishes it from the coherentist account is the importance it attributes to an agent's ability to appreciate the reasons she has. (Once she appreciates these reasons, her inability to act accordingly is, essentially, the inability to conform her act to her (higher-order) desire to be moved accordingly.) What, exactly, is the connection supposed to be between being out of touch with (evaluative and nonevaluative) reality and failing to govern oneself? Clearly, a person who fails to appreciate a wide range of reasons for action is unlikely to govern herself well: she is likely to do things that will, in the long run, thwart her own purposes and interests. The reasons-responsiveness conception of autonomy thus appears to reflect the intuition that when we do something very poorly, we do not really do it at all. There is, however, another possible underlying rationale for regarding ignorance as a threat to self-government. If doing *Y* is constitutive of doing *Z*, then if I authorize myself to be moved by the desire to do *Y* because I mistakenly believe that doing *Y* is a way of not doing *Z*, then there is an

obvious sense in which I have not authorized myself to do what I am now doing when I am moved by the desire to do *Y*. So, if I have a general desire to do what is right and prudent, or, even more generally, a desire to do what I can justify to others, then insofar as I am moved to act in ways that are incompatible with satisfying these desires, there is a sense in which I—who am committed to doing only what I have good (enough) reason to do—have not really authorized my action. Alternatively, we could say that, under these circumstances, something external to my power to guide myself by reasons has prevented me from exercising this power, and so has prevented me from governing myself.

An additional source of support for the reasons-responsive conception of autonomy comes from the thought that someone who cannot respond to the reasons there are must have a limited ability to reason. This brings us to a third popular approach to autonomous agency—an approach that stresses the importance of the reasoning process itself.[3] According to responsiveness to reasoning accounts, the essence of self-government is the capacity to evaluate one's motives on the basis of whatever else one believes and desires, and to adjust these motives in response to one's evaluations. It is the capacity to discern what "follows from" one's beliefs and desires, and to act accordingly. One can exercise this capacity despite holding false beliefs of all kinds about what one has reason to do. Being autonomous is not the same thing as being guided by correct evaluative and normative judgments.

The emphasis on an autonomous agent's responsiveness to her own reasoning reflects the intuition that someone whose education consisted of a method of indoctrination that deprived her of the ability to call her own attitudes into question would, in effect, be governed by her "programmers," not by herself. So, too, someone whose practical reasoning was directly manipulated by others would not govern herself by means of this reasoning. And so, it seems, she would have no power over the motives that this reasoning produced.

Like the coherentists, advocates of responsiveness to reasoning accounts believe that the key to autonomous agency is the ability to distance oneself from one's attitudes and beliefs—to occupy a standpoint that is not constituted by whatever mental states are moving one to act. They agree that motives authorized from this reflective standpoint are internal to the agent herself in a way that her other motives are not. Unlike the coherentists, however, the reasoning-responsive theorists believe that there is more to the capacity for self-reflection than the capacity to hold higher-order attitudes. The authority of our higher-order attitudes is grounded, they claim, in the authority of the practical reasoning that supports these attitudes. So a self-governing agent does not merely endorse her motives: her endorsements are implicit claims about which motives have the support of her reason.

This fact is closely tied to another. Like many accounts that stress an autonomous agent's responsiveness to reasons, responsiveness to reasoning accounts often suggest that self-government requires the capacity for self-transformation. On this assumption, an autonomous agent is capable of changing her mind when she discovers good reason to do so.[4] In contrast, strict coherentists insist that it is possible to act autonomously while being moved by desires that are not only irresistible when they produce their effects, but so integral to one's identity that one could not possibly will to resist them, no matter how convincing one found the arguments in favor of doing so.

The conception of autonomous agency as responsiveness to reasoning clearly has a more internalist character than the conception of autonomous agency as responsiveness to reasons: according to those who stress the autonomous agent's ability to evaluate her own motives, what counts is not the relation between the agent's attitudes and external reality, but her ability to draw inferences from what she wants and believes, and by so doing, to reconsider—to rationally reflect upon—her other desires and beliefs. Insofar, however, as a responsiveness to reasoning account presupposes a particular conception of practical reasoning, it appeals to standards, or principles, that the agent herself might misapply, or fail to recognize altogether. Moreover, even if advocates of autonomy as responsiveness to reasoning have nothing in particular in mind when they speak of the process of "reflection," "rational evaluation," etc., reasoning is a norm-governed process that an agent might reject for reasons of her own. Responsiveness to reasoning accounts thus contain an externalist element that is absent from strict coherentist accounts. They imply that an agent can be mistaken about whether she is really reasoning—and so can be mistaken about whether the power of her motives reflects her authority over her own actions.

This weak externalism naturally expands into more robust varieties. In particular, it supports the idea that whether an agent's reasoning is really her way of authorizing her actions depends on which forces exert a nonrational influence on this reasoning. Even when indoctrination and other more or less imaginary forms of "mind control" do not prevent a person from reaching evaluative conclusions about her own motives, they can prevent her from thinking for herself. So, too, it seems, someone in the grip of compulsion or addiction can be so bullied by this condition that whatever facts she considers, and whatever conclusions she draws, cannot legitimately be attributed to her. One way to interpret these cases is to say that the person's reasoning falls so far short of the norms of "rational reflection" that she is not really reasoning at all. Alternatively, one can say that her reasoning does not guarantee her autonomy because it is under the control of external forces.

Insofar as accounts of autonomy simply stipulate that certain influences on an agent's intention-forming process "interfere with," or "pervert" this process—insofar as they do not explain what distinguishes "internal" from "external" forces—these accounts are incomplete. For they leave it mysterious why certain influences, and not others, are a threat to self-government. One response to the mystery is offered by the reasons-responsive account: the autonomy-undermining influences are the ones that prevent the reasoning process from being sufficiently sensitive to the reasons there are. A fourth approach to autonomy, very different from the other three mentioned so far, rejects the mystery as a symptom of confusion. Thus some philosophers argue that cases of mind-control simply call our attention to the fact that whenever our motives are causally determined by events over which we have no control, their power does not depend on our authority. According to this incompatibilist conception of autonomy, autonomy is incompatible with determinism. If our actions can be fully explained as the effects of causal powers that are independent of us, then even if our beliefs and attitudes are among these effects, we do not govern them, and so we do not govern ourselves.[5]

The approaches just sketched have been developed in many subtly different ways. Some of these differences reflect disagreements over the extent to which the relevant conditions—coherence among higher- and lower-order attitudes, responsiveness to reasons, responsiveness to reasoning, freedom from

determination by external causes—must actually be manifest when an agent determines her will, or whether it is enough that under certain specified circumstances the agent would relate to her motives in the stipulated manner. There is also a difference of opinion about the scope of the relevant capacities: Must an autonomous agent be able to respond to a wide range of reasons for and against her action? or is it enough that her motives are responsive to the “strongest,” “most compelling” reasons? and can these reasons include the sort of credible threats that figure in cases of coercion? What range of attitudes must an autonomous agent be capable of calling into question? How well must she be capable of reasoning? Does it matter whether she is guided by certain principles of rationality? Must it be possible for her to draw different conclusions on the basis of the reasons she considers? Is it essential that she could have considered a different set of reasons instead? Clearly, the many possible answers to these questions can be combined in many different ways. And, more generally, the basic approaches themselves often figure together as necessary or sufficient conditions in a single complex account.

Challenges to Identifying the Minimal Conditions of Personal Autonomy

Whatever specific form the competing proposals take, they all contribute to our understanding of the various ways in which agents can play a governing role in their own actions. They articulate an ideal that agents can realize to various degrees. And in so doing, they shed light on how, with the proper training, a very young child, whose deference to the authority of her own judgments is little more than the form of self-government, can develop into a fully autonomous agent.

This is a very important contribution. Nonetheless, it falls short of giving us everything we have reason to expect from an account of autonomy. In particular, challenges to the different approaches sketched above suggest that no account built from these materials can succeed in distinguishing autonomous from nonautonomous agency. In other words, none of these accounts seems to identify the minimal conditions under which a person can be said to act on her own authority—the conditions that must be satisfied if someone's exercise of authority over her action is to be, not a mere formality, but a way of relating to herself that renders her accountable for the forces that move her to act.

Consider, first, the alleged requirement of responsiveness to reasons. To many critics, there is an obvious problem with this requirement. A person, they argue, can govern herself even if she does not understand the significance of what she is doing. To govern oneself is to maintain a certain self-relation; and, many insist, the elements in this relation include one's own beliefs, however unreliable these may be. In killing Desdemona, Othello fails to accomplish his aim of doing what he has good reason to do. But this does not prevent him from being the author of his own misguided actions. So, too, an envious, vengeful, and very stubborn person does not fail to govern herself just because she is unresponsive to the wide range of reasons against trying to sabotage her colleague's career. An agent's failure to respond to certain reasons may be good evidence of the fact that she is not really the author of her actions. But being out of touch with (evaluative or nonevaluative) reality is not the same thing as lacking autonomy.

Nor does autonomous agency require that one's actions be compatible with one's long-term plans. Such plans often enable a person to exercise some measure of control over her life as a whole; they are her way of governing her more local exercises of self-government. But a person can govern herself at a particular time even while defying her earlier attempts to place constraints on how she will govern herself at this time. She can take it upon herself to abandon her plans, or to modify them in ways she did not anticipate when she first made them. She can even reject the counsel of her long-term values.

Even under such circumstances, an autonomous agent “identifies with” the mental states that move her to act. Many philosophers have thus embraced the coherentist position that the attitude of identification is the key to personal autonomy. But this approach, too, has problems that cannot be solved by combining it with other approaches, problems that become evident when we try to spell out what is involved in identifying with one's motives.

Without an account of identification, we have not advanced beyond our initial intuition that the actions of self-governing agents are caused by motives that are, in some sense, internal to the agents themselves. According to the most popular account, someone identifies with her motives if and only if she endorses, or approves of, them. This, allegedly, is what makes them internal; it is what ensures that their power is really her own. One obvious problem with such accounts is that a person could be brainwashed, or otherwise compelled, to endorse a given motive. Indeed, her brain could be manipulated in such a way that her endorsement is highly responsive to reasons. This has led many to supplement coherentist accounts of autonomy with additional conditions that place constraints on the causal history of an agent's endorsements. But there is reason to doubt that such endorsements are even a necessary condition of autonomous agency. In particular, if to endorse one's motive is, essentially, to judge that this motive—or acting from this motive—is good, then the endorsement account of autonomy does not appear to accommodate cases of weakness of will.

By definition, a weak-willed action is an action that someone performs against her best judgment, even while “acting of her own free will” in whatever sense suffices to render an agent accountable for her behavior. A weak-willed agent authorizes herself to act as she does, despite her belief that she has good reason to act otherwise. When someone asserts her authority in this way, she is criticizably irrational; and it is notoriously difficult to make sense of this form of irrationality.[6] For our purposes, however, it is enough to note that if weakness of will is a genuine phenomenon, then human agents have the capacity to govern themselves in a way that they themselves take to be unjustified. They can claim for themselves an authority that challenges the authority of their own reason.

Again, someone whose action

is caused in this way does not govern herself as thoroughly as someone whose will is “strong.” For she acts for a reason that she herself deems inadequate; and so she is not (adequately) governed by the norms of her own thought. The point, however, is that even under these conditions, she is an autonomous agent. Self-conflicted though she may be, she is still accountable for what she does. This is not simply because what she does is the result of an earlier autonomous action. Rather, her accountability is intrinsic to her

weak-willed action itself. She is a weak-willed self-governor.

The possibility of weakness of will implies that the authorization an agent must give to her motives if she is to count as (minimally) governing their effects need not take the form of the judgment that no alternative action would be better. Some philosophers have lent support to this conclusion by arguing that there are other cases in which a person's authorizations can come apart from her evaluations. Sometimes, they claim, a person cannot follow the recommendations of her own reason without betraying herself. A woman, for example, may conclude that even though she has very good reason to give up her child for adoption, she cannot recognize herself in this action, and so cannot identify with the desire to perform it.[7] Reasonable people will surely disagree about how best to interpret any particular example. But human experience does seem to support the general point: the human capacity for self-reflection enables human agents to distance themselves in thought from every aspect of their own psyches—even their rational reflections. Given this possibility, a person's identification with her motives cannot be cashed out in terms of higher-order attitudes of approval and disapproval, or in terms of the rational reflections that typically ground these attitudes.

What is it, then, to "identify with" certain features of one's mental life? It would seem to be nothing more than to confer one's authority upon them, i.e., to authorize their influence. But if this is right, then the concept of identification cannot help us to distinguish autonomous agents from the rest. It does not provide us with the looked-for explanation of what distinguishes an autonomous agent from someone who exercises her authority at the bidding of external powers, and whose authorization of her motives is thus a mere formality.

Most philosophers fail to recognize the extent of this problem. They acknowledge the possibility of autonomy-undermining influences, like brainwashing, that exert their power behind the scenes. But they also believe that there are straightforward cases in which a person lacks autonomy because she performs an action without authorizing herself to perform it. They point to the case of someone who takes drugs when she would rather resist the motivating force of her addiction. They note that even if many people who fit this description are merely weak-willed, not all of them are. Some addicts, compulsives, and others suffering from emotional and psychic distress are the helpless victims of their own psychological states; and these unfortunate agents lack autonomy precisely because they repudiate their own motives.

Compelling as this diagnosis may be, however, it proves too much. It assimilates addicts to people like those with Tourette's Syndrome, whose behavior is not even voluntary. It reduces the distinction between autonomous and nonautonomous agents to the distinction between agents and nonagents. If someone's motives directly defy her authority (rather than ensuring that she exercises this authority on their terms), then her behavior does not reflect her deference to this authority, and so it fails to satisfy an essential feature of agency. Under such circumstances, a person's motives have a power that is not only unauthorized by the agent herself, and hence, distinct from—external to—her power as an agent; they produce their effects in a way that bypasses her (her agency) altogether. Even if she can acknowledge that there is something to be said for behaving as she does, she is a passive bystander to this behavior, as alienated from the causal efficacy of her own motives as she is from the causal efficacy of the physiological states that produce her reflex movements. She is not an autonomous agent because she is

not an agent at all.

Agents as Causes and the Practical Point of View

If agents cannot initiate their own actions “on purpose” without authorizing themselves (their motives) to do so, then the distinguishing feature of autonomous agents is not that they identify with their motives but that the authority they assert in doing so is more than a mere formality. What does this difference come to? The incompatibilist, we saw, has a ready answer: in the case of autonomous agency, and only in the case of autonomous agency, there is more to the agent's assertion of authority than the expression of external power. The familiar problem with this answer is that there seems to be no way for an agent to gain an extra measure of control over her motives simply by acquiring attitudes or judgments or other mental states that are not determined by anything else. If someone's attitude toward her motives is not determined by any earlier state of affairs, then how can it be determined by her?

This question pushes those with incompatibilist intuitions to attribute a special causal power to agents—a power that is not reducible to the power one event transmits to another. A person, some incompatibilists argue, can agent-cause a certain response to earlier events in a way that is not itself the effect of these earlier events. Simply by virtue of being the particular person she is, she can bring it about that she is motivated in a certain way. And the explanatory fact that she is this particular person cannot be reduced to any more basic facts about her dispositions to respond in certain ways to certain inputs; her power over her actions cannot be reduced to the power of external motivating forces.[8]

The obscurities of agent-causation are enough to prevent most philosophers from embracing this conception of autonomous agency. To mention just a few familiar challenges: If agent-causing an event does not involve doing anything, then how does the agent exert her causal power? and why does this power produce its effects at one time rather than another? If, on the other hand, the agent must do something in order to agent-cause an action, then doesn't this require that she undergo some change? and isn't this change of state itself an event? On the basis of these and other difficulties, many conclude that the appeal to agent-causation provides no more insight into autonomy than the simple assertion that we can sometimes govern the effects of our own motives. Yet the agent-causation theorists call our attention to something important. The strong conviction that we are often autonomous agents is grounded in the basic experience of determining our own wills. We believe that we have the capacity for self-government because we believe that, whatever forces may be pressing us to act, it is ultimately “up to us” to determine what to “make of” the pushes and pulls that constitute our mental life.

The seeming incoherence of agent-causation, and more generally, the seeming impossibility of articulating a conception of agency according to which the capacity for self-government depends on the agent's freedom from determining causes, leads some to conclude that autonomous agency is an illusion: our deep conviction notwithstanding, we do not really know that we can govern ourselves. Others, however, see things differently. They argue that this pessimistic conclusion reflects a misunderstanding of the very nature of rational agency. In making their case, they take their lead from the philosopher who has contributed more than any other to our understanding of autonomy. Kant, they note, stresses the deep

differences between the two points of view from which we can think about ourselves and our world.[9] We take up the theoretical point of view in order to gain knowledge about the nature of reality, and on this basis make predictions about which effects will follow from which causes. When we want to make up our minds about what to do, however, we take up the practical point of view. From this point of view, too, we survey the facts that are relevant to our decisions. But none of these facts, taken singly or together, is intrinsically action-guiding; none can free us from the task of drawing our own conclusions about what we have reason to do. This is true even of facts about reasons. Whatever the basis of these facts may be, the normative relations among them are far from determinate. We have to make the necessary determinations ourselves. Given everything we know about what is and what ought to be, we have to determine how we are going to act.

Necessarily, theoretical reasoners are passive bystanders to the events on the basis of which they predict future events. But practical reasoners are not mere observers of the passing scene. As practical reasoners, we have no choice but to determine our responses to what we observe—even if everything we do—and so, everything we decide to do—is determined by events in the past. To make up our minds, we need not be sophisticated reasoners. We need not even be capable of doubting the legitimacy of our most powerful motives. We must, however, find a reason to do one thing rather than another. And since no fact can play the role of a reason unless someone takes it to be a reason, practical reasoners necessarily have the ultimate authority over the powers that move them.

Conclusion

We are back where we started. The demand to be permitted to govern ourselves reflects the conviction that we are, in essence, self-governors. In essence, but not always in fact. Sometimes our authority over our actions is nothing but the form of self-government. Sometimes we are not autonomous agents. If, then, the structure of rational agency justifies our conviction that we are capable of governing our own actions, it does not hold the key to the distinction between those cases in which we fail to exercise this capacity and those in which we succeed. The conviction that there is such a distinction is grounded in the obvious fact that victims of brainwashing, compulsion, addiction, depression, anxiety, and many other conditions are prevented from governing themselves. If their lack of autonomy is not simply a function of the fact that their actions are causally determined by states of affairs over which they have no control, and if it is not equivalent to any fact about the considerations they are disposed to recognize and be moved by, then it would seem to be a more intrinsic feature of their agency. No particular attitude seems to be essential to autonomous agency, however—except, of course, the attitude of authorization that is essential to all action for a reason. Nor is it necessary that any particular principles of reasoning serve the autonomous agent as guides—except, again, whatever principles must guide the action of even nonautonomous agents. The content of our desire to govern ourselves when we act thus remains obscure to us, even as the legitimacy of this desire is clear.

Notes to Personal Autonomy

Notes

1. For three different versions of this approach, see Frankfurt 1988c, Watson 1975, and Bratman 1979. In Frankfurt's early work, the relevant attitude appears to be a higher-order desire. Later, however, he speaks of a distinct, irreducible attitude of "satisfaction." In contrast, Watson's account singles out the evaluative judgment that one's action makes sense in terms of one's values. And Bratman stresses the extent to which the motives of self-governors conform to their policies. (Note that, on Watson's account, the "attitude" that distinguishes autonomous, morally responsible agents is only by implication an attitude they take toward their motives.) Whereas Watson appeals to Plato's philosophy of mind, Frankfurt has deep affinities with Hume. In stressing the importance of the autonomous agent's attitude toward her motives, he also takes his inspiration from Spinoza.

2. Bernard Berofsky calls attention to the fact that there is support "across a broad spectrum" of theorizing in psychology and psychiatry, for the idea that certain inner states undermine autonomy by creating "barriers to objectivity." They do this, he explains, by "persisting in a way that removes them from experiential review and the influence of newly acquired information." (Berofsky 1995, p. 199) For two more examples of recent philosophical accounts that stress the importance of the autonomous agent's responsiveness to reasons, see Wolf, 1990 and Fischer and Ravizza,1993. These philosophers argue that responsiveness to reasons is a necessary condition of moral responsibility. But in presenting and defending their views, they suggest that unless an agent satisfies this condition, she does not really govern herself. As Wolf puts it, they are interested in the "relation to one's will which is necessary in order for one's actions … to be 'up to oneself' in the way that is necessary for responsibility."(4) (Note that Wolf reserves the term 'autonomy' for one particular conception of this self-relation: the view that an agent's control over her behavior must be "ultimate" — that "her will must be determined by her self, and her self must not, in turn, be determined by anything external to itself"(10).) According to Wolf, responsiveness to reasons is a necessary supplement to a coherentist condition: "a person's status as a responsible agent rests not only on her ability to make her behavior conform to her deepest values but also on her ability to form, assess, and revise those values on the basis of a recognition and appreciation of … the True and the Good." In stressing that an autonomous agent "must be in a position that allows her reasons to be governed by what reasons there are… [i.e.,] by what is valuable and worthless" (117-118), Wolf evokes a tradition that goes back to Plato. But she rejects the Platonic conception of values as "things" that can be "apprehended by some special faculty"(123). Fischer and Ravizza likewise try to steer clear of controversial metaethical assumptions. "Regular reasons-receptivity" is, they argue, essential to having "guidance control" over one's action. "It involves a pattern of actual and hypothetical recognition of reasons (some of which are moral reasons) that is understandable by some appropriate external observer. And the pattern must be at least minimally grounded in reality."(90) (Unlike Wolf, Fischer and Ravizza do not think that reasons responsiveness suffices for moral responsibility. They

believe that in order for an agent to "own" the reasons-responsive mechanism that produces his action, he must "take responsibility" for it. To do this, he must "see himself as an agent" and "accept that he is a fair target of the reactive attitudes as a result of how he exercises this agency in certain contexts"(210-211).

3. The importance of acquiring motives in a way that is responsive to one's own reasoning is taken for granted by most writers on autonomy—though it is widely acknowledged that agents need not actively deliberate prior to every autonomous action. On this view autonomy is "achieved when the individual subjects the norms with which he or she is confronted to critical evaluation and then proceeds to reach practical decisions by way of independent and rational reflection"(Young 1986). In other words, one's conduct is autonomous only if one exercises "assorted introspective, imaginative, reasoning, and volitional skills."(Meyers 1987) This procedural requirement of this kind is often grafted onto coherentist accounts. Thus, in his early work, Gerald Dworkin argues that someone who identifies with his motives lacks autonomy if this identification reflects the fact that he has "been influenced in decisive ways by others in such a fashion that we are not prepared to think of it as his own choice"(Dworkin 1976, 25,) (In his more recent work, Dworkin suggests that an autonomous agent need not actually identify with her motives as long as she is capable of altering her preferences in light of her uncompelled reflection.) (Dworkin 1988) For some examples of recent attempts to work out the details of such a condition, see Mele 1995 and Christman 1991. Mele argues that an autonomous agent must be capable of reflecting critically upon her desires, and of altering them in light of this reflection. Her beliefs must be "conducive to informed deliberation"; and she must be a "reliable deliberator"(**chap. 10). Similarly, Christman stresses the importance of the autonomous agent's ability to reflect (in a "minimally rational" way) on the process whereby she acquired a given desire. He argues that someone acts autonomously when she is moved by a given desire, only if she would not reject the desire if she reflected on its genesis. [**others: Haworth, D. Meyers**]

4. As Dworkin puts it, what is necessary for autonomy is "some ability both to alter one's preferences and to make them effective in one's actions" (Dworkin 1988).

5. For a powerful defense of the incompatibilist position, see van Inwagen 1983. Much of the debate over the relationship between causal determinism, on the one hand, and autonomy, free will, and moral responsibility, on the other, consists of attempts to challenge and defend the modal argument that is at the heart of this defense. This argument spells out the widespread intuition that someone cannot govern her own action if she could not have done anything to refrain from performing it. Frankfurt's alleged counterexamples to this "Principle of Alternative Possibilities" have also been the focus of intense philosophical debate. (See Frankfurt 1988b) For a thorough discussion of the modal argument for incompatibilism, see Fischer 1994. For a recent attempt to work out a rigorous incompatibilist conception of autonomy, see Kane1996. According to Kane, the desire to be an autonomous agent is the desire to have "the power to be the ultimate producers of [one's] own ends… the power to make choices which can only and finally be explained in terms of [one's] own [will] (i.e., character, motives, and efforts of will)." "No one," he argues, "can have this power in a determined world."(254)

6. Attempts to make sense of weakness of will go back to Plato and Aristotle (see *). For some more recent discussions, see Donald Davidson 1980, Gary Watson 1977, Michael Bratman 1979, Alfred Mele 1995 and Sarah Buss 1997.

7. The example is Frankfurt's (Frankfurt 2002b). The mother, he says, may be “glad to be putting her need for the relationship above what is best by a measure that she now refuses to regard as decisive”(163). More generally, Frankfurt argues that “the fact that something is important to someone is a circumstance that naturally has its causes, but it may neither originate in, nor be at all supported by, reasons. It may simply be a brute fact, which is not derived from any assessment or appreciation whatever”(161). “Suppose,” Frankfurt elsewhere writes, “I were to conclude for some reason that it is not desirable for me to seek the well-being of my children. I suspect that I would continue to love them and to care about their well-being anyhow. This discrepancy between my judgment and my desire would not show that I had become alienated from the desire.”(Frankfurt 2002, 223) For a thorough discussion of Frankfurt's position, see Watson 2002.

8. Thomas Reid is an early champion of this approach. More recently, agent-causation theories have been defended by Richard Taylor and Roderick Chisholm; and more recently still, by Randolph Clarke and Timothy O'Connor.

9. See, for example, Korsgaard 1996 and Bok 1998. As Bok explains,

> When I act for reasons, the events that cause me to act as I do might be external to me, but the reasons that I regard as determining what I do cannot be. For while, *qua* event, my acceptance of some reason for action might or might not ultimately be caused by something outside myself, in regarding it as a reason for action I must regard it as having a justification that is independent of those causes. This justification might at various points appeal to theoretical claims. But I cannot regard it, *qua* justification, as having been produced or foisted on me by any natural event. When I consider it as a justification, I consider not its causal origins but its rational grounds; and I accept or reject it on that basis. When I explain what leads me to accept it, I will adduce not the causes that led me to do so, but the reasons that convinced me that it was sound. Because any reasons I adduce must themselves be reasons I accept, this type of explanation will not ultimately lead me to adduce determining factors that I do not regard as my own.(206)

For essentially the same point in a less Kantian context, see D.M. McKay 1960 & 1973, and Hampshire 1983. Like others, they point out that the question “How will *A* act?” has no determinate answer for *A* until she decides how to act. What is a simple fact from the perspective of a third-person observer is not a fact from the perspective of the agent herself. Similarly, J. David Velleman argues that the freedom that counts where autonomous agency is concerned is epistemic freedom with respect to one's alternatives (Velleman 2000). Intentions, he claims, are a special sort of belief that the agent has the power to make true.

> Our expectation of doing something embodies an invention rather than a discovery. For we can simply adopt the expectation that we're going to do any one of the things for which we have some antecedent motives, and this expectation will modify the balance of forces so as to make itself true. We are thus in a position to make up our forthcoming behavior. Making up what we will do is, in fact, our way of making up our minds to do it.(24)

This essential formal feature of the practical point of view is at the center of most existentialist conceptions of human agency. Thus, for example, Jean-Paul Sartre claims that “[M]otives are only for consciousness. And due to the very fact that the motive can arise only as appearance, it constitutes itself as ineffective. … [C]onsciousness is not subject to it because of the very fact that consiciousness posits it; for consciousness has now the task of conferring on the motive its meaning and its importance.”(Sartre 1956, 71)

Thomas Reid

Thomas Reid (1710-1796) is a Scottish philosopher and one of the founders of the "common sense" school of philosophy. (Also included in the common sense school are such less well-known 18th century philosophers as James Beattie, George Campbell, and Dugald Stewart.) Reid is best known for his epistemology of sensation -- he believes that sensations serve to make us directly aware of real objects without the aid of any intervening medium -- and for his view of free will -- he holds that the only free actions are those that come about through a causal process originated by the agent. In the explication of both he offers perceptive and important criticisms of the philosophy of Locke, Berkeley and especially Hume. He is also well known for his criticisms of Locke's view of personal identity and Hume's view of causation. However, Reid also wrote on a wide variety of other philosophical topics including ethics, aesthetics and various topics in the philosophy of mind.

After studying at the University of Aberdeen, Reid entered the ministry in New Machar in 1737. In 1748 he published a short essay entitled "An Essay on Quantity" which concerned Hutchison's *Inquiry into the Origin of Our Ideas of Beauty and Virtue*. Although this was his only published work, he was given a professorship at King's College Aberdeen in 1752. There he wrote *An Inquiry Into the Human Mind on the Principles of Common Sense* (published in 1764). Shortly afterward he was given a much more prestigious professorship at the University of Glasgow. He resigned from this position in 1781 in order to give himself greater time to write, and published *Essays on the Intellectual Powers of Man* in 1785 and *Essays on the Active Powers of Man* in 1788.

In the *Inquiry*, which is primarily a work in epistemology, Reid examines each of the five senses and discusses the ways in which we achieve knowledge of the world through employing them. Much of the

view developed in the *Inquiry* reappears in the *Essays on the Intellectual Powers*, which expands his epistemological picture beyond the apprehension of the world through the senses to consideration of memory, imagination, knowledge concerning kinds of things, the nature of judgment, reasoning and taste. The *Essays on the Active Powers* examines a collection of topics concerning ethics, the nature of agency generally, and the distinctive features of human agency.

Common Sense and Ordinary Language

Reid is a staunch defender of "common sense", or, as he sometimes puts it, the opinions of "the vulgar". In fact, in almost every arena of philosophical inquiry, Reid's positions are in various ways tied up with his overall project of defending common sense. Common sense, for Reid, are those tenets that we cannot help but believe, given that we are constructed the way we are constructed. This is not to say that nobody fails to believe the dictates of common sense. People often have beliefs that are in manifest conflict with common sense, but to have such beliefs, Reid thinks, is to be in deep conflict with one's nature as a human being. What this suggests is that Reid takes on a burden of showing, each time that he claims some particular view to be a dictate of common sense, that belief in it is dictated by human nature. In addition, much of Reid's philosophy proceeds from the assumption that the dictates of common sense could not possibly conflict with one another. Human nature could not be such as to lead us to contradictory beliefs. The collection of tenets that make up common sense are consistent with one another, and non-optional to those who are believing as a human being does.

He sees a close tie between the dictates of common sense and distinctions and positions that could be found buried in the structure of ordinary language. Ordinary language, for Reid, is the mirror of our ordinary, everyday thought. (The connection between ordinary language and common sense that Reid espouses was of great influence on much later philosophers such as G. E. Moore and J. L. Austin.) Reid

does not believe, however, that every feature of ordinary language is indicative of some important tenet of common sense. Reid often suggests that the relevant features are those that can be found in "the structure of all languages", suggesting that the linguistic features of relevance are features of syntactic structure shared among languages. For example, Reid repeatedly says that it is a dictate of common sense that there is some important difference between the active and the passive, since "all languages" have a passive and active voice. The mere fact, then, that we say something in ordinary language does not imply that, for Reid, it is to be taken as a tenet of common sense. Rather, syntactic structures shared among languages often indicate, Reid thinks, features of our common sense conception of the world. When a certain tenet is implied by some feature shared by "all languages", Reid thinks it very likely that the best explanation for its being so shared is that it is a dictate of common sense.

Reid's attachment to common sense as found in ordinary language is easy to caricature unfairly. Reid did not hold that every position that can be deduced from a linguistic feature shared by all languages is a dictate of common sense, something that we cannot help but believe if we are to be true to our natures. He says, for instance,

> A philosopher is, no doubt, entitled to examine even those distinctions that are to be found in the structure of all languages; and, if he is able to shew that there is no foundation for them in the nature of the things distinguished; if he can point out some predjudice common to mankind which has led them to distinguish things which are not really different; in that case, such a distinction may be imputed to a vulgar error, which ought to be corrected in philosophy. But when, in the first setting out, he takes it for granted without proof, that distinctions found in the structure of all languages, have no foundation in nature; this surely is too fastidious a way of treating the common sense of mankind. (*Essays on the Intellectual Powers of Man*, p.14)

However, he does hold that the burden of proof is squarely on the shoulders of those who deny something suggested by a syntactic feature shared across languages. If it is possible to find a claim in another philosopher's argument which sits uneasily with the facts about ordinary language, and the philosopher has failed to show that the claim suggested by ordinary language rests on a deep error, then, on Reid's view, we have found a sufficient reason to reject the philosopher's argument.

What this means is that Reid is not concerned to answer certain questions of justification that can seem enormously pressing to us in certain philosophical moods. He is not, for instance, interested in providing a justification for our belief in the external world by appeal to first principles of some sort. For instance, Reid feels he can refute skeptical hypotheses -- such as Descartes's hypothesis of an evil demon who makes us believe that the world is the way we take it to be when it is really vastly different -- simply by showing that such a hypothesis is no more likely to be true than the common-sensical belief that the world is much the way we perceive it to be. Since the belief in the external world is a dictate of common sense, it is, Reid thinks, as justified as it needs to be when it is shown to be on the same footing as any alternative. Justification, therefore, does not necessarily require providing positive reasons in favor of common-sensical beliefs; common sense beliefs could be adequately justified simply by undermining the force of the reasons in favor of alternatives to common sense. Common sense, as found in the structure of

ordinary language, then, constrains, rather than dictates, acceptable philosophical positions.

Epistemology

Attacking the Way of Ideas

One of Reid's most important critical contributions is his attack on the model of the mental offered by Locke (although Locke derived it in large part from Descartes) and accepted in broad outline by Berkeley and Hume. As Reid reads Locke, all thought-like mental attitudes -- as opposed to emotions, desires, choices and the like -- whether they be thoughts concerning real objects, imaginative reveries, or even sensations, can be analyzed as "perceptions" of ideas. "Perception" here is used in a somewhat technical sense not to describe any of the the exercises of the five senses -- nor even to describe all that is going on when we are aware of external objects -- but, instead, to describe a special mental operation, a kind of mental "vision", so to speak. On the Lockean model, for instance, to think about an apple is to perceive an idea of an apple; the idea is a distinctive mental object grasped or perceived through the exercise of one's mental "eyes". It is through the perceiving of an idea -- in this technical sense of "perceive" -- that we perceive -- in a more ordinary sense of the term -- objects that correspond to those ideas; we are aware of the apple by perceiving an idea of it. Berkeley, and especially Hume, revise and expand this picture in various ways, but they maintain the overall schema: mental phenomena are perceptions of mental objects.

From within the Lockean model, there are at least three things that might be said regarding the sense in which we are aware of external objects. The Lockean might say, (1) that we are aware of external objects directly *by* perceiving representations of them, ideas; (2) that we *infer* the existence and nature of external objects by perceiving ideas of them, the nature of which we grasp directly; or, (3) that there is no distinction between external objects and ideas, and, thus, when we perceive ideas we are perceiving external objects. On the first approach, the Lockean would need to offer an explanation of what it is that is so special about ideas that makes it the case that whenever we are perceiving one we are directly aware of that which it represents. If this burden can be discharged, then it is possible to say that we are aware of external objects and remain consistent with the Lockean conception of the mental. Reid, however, thinks that the history of philosophy from the Ancients through his own time has been marked by a series of failed efforts to explain how it is that perception of something in the mind could amount, automatically, to perception of some external object. All such attempts make the mistake, he thinks, of giving unexplained and unexplainable powers to the internal mental objects: how could they possibly, all by themselves, attach our minds to objects whenever they are perceived? Since this question cannot be answered, he thinks, we are left with the second and third alternatives: either we infer the nature of external objects from the features of directly perceived ideas, or else Berkeleyan Idealism is true: external objects are ideas.

Reid thinks that nobody who has absorbed Hume's lessons regarding causation would think that we can avoid skepticism about the external world while insisting that we infer its nature from the features of directly perceived ideas. After all, on the Lockean model, external objects are the causes of our ideas. But if Hume is right about causation, then we can only infer the nature of a particular unobserved cause of a

particular observed effect when we have had repeated experience of conjunction of similar causes with similar effects. Therefore, we can infer nothing about external objects by examination of the ideas which they cause in us: we have never had any experience of the relevant causes, but only experience of the relevant effects. Thus, Reid thinks, Lockeans about the mental are committed either to outright skepticism or Berkeleyan Idealism.

While his desire to overthrow skepticism and idealism -- both of which he takes to be in violation of common sense -- is part of Reid's motivation for attacking the Lockean model of the mental, he is careful not to attack the model merely on the grounds that it is in violation of common sense. In fact, Reid offers a range of criticisms that could be accepted quite readily even by those who deny that philosophical theses ought to be constrained by common sense. He says, for instance,

> When, therefore, in common language, we speak of having an idea of anything, we mean no more by that expression, but thinking of it. The vulgar allow that this expression implies a mind that thinks, an act of that mind which we call thinking, and an object about which we think. But, besides these three, the philosopher conceives that there is a fourth--to wit, the *idea*, which is the immediate object. The idea is in the mind itself, and can have no existence but in a mind that thinks; but the remote or mediate object may be something external, as the sun or moon; it may be something past or future; it may be something which never existed. This is the philosophical meaning of the word *idea*; and we may observe that this meaning of that word is built upon a philosophical opinion: for, if philosophers had not believed that there are such immediate objects of all our thoughts in the mind, they would never have used the word idea to express them. (*Essays on the Intellectual Powers of Man*, p. 20)

Reid can be taken here to be imagining a kind of conversation between "the vulgar" on the one hand and " the philosopher" on the other. The vulgar say, "When I think about an apple in front of me, for instance, the immediate object of my perception is the real apple." The philosopher responds, "No, the immediate object of your perception is a mental object, an idea of the apple." But, Reid points out, the philosopher's response, which seems to be instructing the vulgar on their mistake, is actually predicated on a prior rejection of the vulgar's conception of everyday thoughts about objects. The Lockean claim that there is a "fourth" element in every thought -- an idea -- is "built upon a philosophical opinion", that is, the model arises from rejection of the common sense view and thus can't be given as a reason to reject the "vulgar" position. What Reid is doing here is shifting the burden of proof on to those who hold the Lockean model; there is nothing inherently superior about the Lockean picture, and hence the common sense picture -- under which we are aware of real objects directly and without mediation -- is, as yet, no less well defended.

In one of Reid's more powerful arguments against the Lockean model, he points out that the Lockean model is supposed to explain the fact that our mental states manage to connect to real objects, manage to be *about* real objects. However, this fact about beliefs is only explained by the model if the model is less obscure than the phenomena to be explained by it. But, Reid points out, if we start by noticing that we don't understand how it is that we manage to connect our minds to objects in the world, it can't help to say

that we do it by first connecting our minds to mental objects (ideas) unless we understand how it is that we manage to connect our minds to those mental objects. That is, why is mental perception, or awareness, of ideas thought to be any more intelligible than awareness of objects? If it is no more intelligible, then the Lockean model is not serving to explain what it was intended to explain. (One place in which this objection appears is at *Essays on the Intellectual Powers of Man*, p. 229.)

Reid also uses the distinction between real and apparent magnitude developed in Berkeley's *New Theory of Vision* to respond to one of Hume's arguments for the claim that the immediate objects of awareness are mental objects rather than real objects. (See *Essays on the Intellectual Powers of Man*, pp. 224-225.) As Reid reads him, Hume argues that since, for instance, objects get smaller in our visual field as we move away from them, and real objects don't change size merely as a result of the fact that we move away from them, we must not be directly aware of the real sizes of objects. Reid claims that Hume is equivocating on two different notions of magnitude. The *apparent* magnitude of the object is the size that the object appears to have when looked at from a certain place. Apparent magnitude is a relational property of objects: the apparent magnitude of an object is a function not just of intrinsic features of the object, but also of the location of a particular observer. Real magnitude, on the other hand, is an intrinsic property of objects, not dependent on the position of any observer. So, when we move away from an object, we are perceiving properties of that object: its apparent magnitude relative to the locations through which we pass. Thus, Reid concludes, the fact that the real magnitude of the object doesn't change as we move away from the object is irrelevant to the question of whether or not the immediate objects of awareness are mental items, like ideas, or qualities of objects. Just because we aren't perceiving the real magnitude of the object as we move away from it doesn't mean that we aren't perceiving a propery of the object itself. We *are* perceiving a property of the object itself, namely, it's apparent magnitude.

None of Reid's arguments against the "way of ideas", as the Lockean model of the mental was sometimes called, are definitive. But they all aim to shift the burden of proof back to those who subscribe to the Lockean model. Since Reid saw the Lockean model as manifestly in violation of common sense, and since he took it to be a violation of correct philosophical methodology to accept any view contrary to common sense which was no better defended than the common-sensical view, he felt that to shift the burden of proof back to the subscribers to the Lockean model was to refute the model.

Sensation, Conception and Perception

Reid supplants the Lockean model with an act-based conception of the mental. That is, states of the mind cannot be analyzed into mental act and mental object, as on the Lockean model. The mind's states are all acts, loosely conceived; the only objects involved in thought are in the world, not the mind. The three most important mental acts are labelled by Reid "sensation", "conception", and "perception".

While none of these operations is defined or analyzed by Reid with exact philosophical rigor -- in fact, Reid suggests that such analyses aren't really possible in this domain -- it is possible to make some rough remarks about what Reid has in mind. Sensations are the feelings that are the immediate mental causal consequences of the influence of objects on us. Sensations are always associated with a particular organ

of sense; they are always distinctly *of* , for instance, touch or vision. Conceptions, on the other hand, are ways of being aware of objects. To conceive of an object is to be aware of that object *as* the bearer of some particular property. One might conceive of an apple *as* red or *as* hard or *as* both red and hard. Further, one could conceive of an object -- and thus be directly aware of that object -- as possessing a particular relational property: to conceive of an object as having a particular apparent magnitude, for instance, is to be aware of the object itself as possessing the property of appearing a certain way from a certain location. Perceptions are a species of conception. To perceive an object is to be aware of it in a particular way, as the possessor of a particular quality, *and*, at the same time, to be convinced that the object exists and is as you conceive it to be. Objects, then, act on our bodies and cause us to have sensations -- a feeling of coldness, a visual image of color. These sensations, in turn, lead us -- Reid sometimes says "suggest to us" -- conceptions of their causes; we become aware of the causes of our sensations as possessing various qualities. Sometimes, although not always, these conceptions are accompanied by a conviction in their accuracy, and when they are, they are called "perceptions".

To defend common sense, Reid thinks, he needs to show that we are directly aware of real objects and are, most of the time, roughly right about the nature of the objects of which we are aware. Reid does not think that anything comparable needs to be shown about sensation. That is, sensation -- the direct effect of objects on our minds -- needn't, in itself, accurately represent the world. Rather, our sensations must help us -- and much of the rest of this section is aimed at explaining how -- to place our minds in direct contact with the world. Sensations are merely tools for obtaining what Reid thinks we all believe, common-sensically, to be the case: that in having conceptions, we are aware of real objects that are roughly the way we conceive them to be.

Reid, then, is offering a form of "direct realism": the view that our minds connect to the world directly, rather than through some sort of medium (such as ideas) to which our minds connect and which itself, somehow, connects to the world. While there is debate over the precise sense in which, for Reid, we are directly aware of objects, this much seems clear: whatever the sense of "direct" is in which the subscribers to the Lockean model take us to be directly aware of ideas, it is in that sense that Reid takes us to be directly aware of real objects.

Primary and Secondary Qualities

Intertwined with Reid's view that we can be immediately aware of objects through their relational properties -- such as their apparent magnitudes -- are Reid's views regarding the distinction between primary and secondary qualities. Locke thought that our ideas of "primary qualities" -- shapes, sizes and motions -- and configurations of the primary qualities of the stuff out of which bodies are built -- texture and construction -- resemble the qualities which cause them. However, according to Locke, our ideas of a variety of other qualities -- particularly, colors, sounds, tastes and smells -- do not. Ideas of colors, sounds, tastes and smells are caused by certain complex configurations of primary qualities -- when such configurations are characterized as powers to produce ideas in us, then they are called "secondary qualities" -- that bear no resemblance whatsoever to the ideas which they cause. Reid is deeply struck by Berkeley's attack on this distinction (at, for instance, *Principles of Human Knowledge*, Part 1, Sections 9-15), and agrees with Berkeley that no mental state or object could possibly resemble anything that was

not, itself, a mental state or object; as Berkeley puts it "An idea can be like nothing but an idea" (*Principles of Human Knowledge*, Part 1, Section 8). Mental states and objects have only mental properties, but only something that is, itself, a mental state or object can have a mental property; hence, nothing can resemble -- that is, share a property in common with -- a mental state or object other than another mental state or object. Berkeley took this point to show that *no* non-mental cause of an idea could resemble it, whether the relevant idea were an idea of a shape, say, on the one hand, or a color on the other, and, thus, there could be no distinction between primary and secondary qualities of the sort drawn by Locke.

Reid accepts, for roughly Berkeley's reasons, that sensations cannot possibly resemble their causes (with one qualification regarding visual sensations discussed below). Further, he accepts Berkeley's objections to Locke, and takes them to show that no mental events or states, whether sensations or the conceptions of objects that follow them, could possibly resemble any non-mental object. In addition, there is another reason that Reid cannot draw the distinction between primary and secondary qualities in the way that Locke did: he does not accept that the conceptions of objects which we have following the sensations which they cause in us are to be analyzed as perceptions of ideas; they are, rather, awareness of the qualities in the object that caused the sensations. For Reid, there is no immediately perceived mental object that could succeed or fail to resemble its cause; it is the qualities of objects themselves of which we are directly aware when we have conceptions of those objects. All of this would make it seem that Reid would simply side with Berkeley and deny that there is any important difference between primary qualities and qualities like colors, sounds, tastes and smells. However, he does not take Berkeley's side, but, instead, defends the distinction between primary and secondary qualities on grounds quite different from Locke's, grounds that he takes to be immune to Berkeley's criticisms of the distinction.

Reid accepts that the qualities which we ordinarily conceive objects to have -- whether shapes, sizes and motions, on the one hand, or colors, sounds, tastes and smells, on the other -- are genuinely possessed by those objects (barring illusions and disorders of various sorts, which are, incidentally, difficult for Reid to explain). However, he thinks that shapes, sizes and motions are intrinsic properties of objects while colors, sounds, tastes and smells are relational properties of objects; and, it is to be emphasized, neither (with rare exceptions discussed below) resemble the mental states which they immediately cause in us, namely sensations. Colors, sounds, tastes and smells are powers to produce certain characteristic sensations in us in normal conditions; to ascribe such a quality to an object is not to perceive any intrinsic qualities of the object, but is, rather, to perceive that the object bears a certain relation to something else: namely, ourselves. So, for instance, say that the skin of the apple in front of me has a certain molecular structure that results in its reflecting light at a certain wavelength which in turn causes in me a certain characteristic visual sensation of red. If I am speaking correctly when I say, "That apple is red", I am reporting the fact that I conceive of the apple as possessing a particular relational property: I am aware that the apple has the property of being-such-as-to-cause-in-me-sensations-of-red-in-normal-conditions. Ultimately, the apple possesses this relational property because of facts about its molecular structure that account for its reflecting light in a certain way, and facts about me that account for the fact that such wavelengths of light cause certain sensations in me. But when I am aware of the redness of the apple, I am aware of none of that; I am aware only of the fact that there is something about the apple that makes it cause in me certain sensations in normal conditions.

Our conceptions of qualities such as colors are to be contrasted with our conceptions of primary qualities or configurations of primary qualities, such as hardness. Say I'm holding the apple in my hand while I'm looking at it. I'm having, then, two importantly different sensations: a visual sensation of red, and a tactile sensation of hardness. For Reid, neither sensation resembles anything in the object; both give rise to conceptions of the object as possessing certain properties. The visual sensation gives rise to a conception of the object as possessing a particular relational property: its power to produce certain sensations in me in normal conditions; the tactile sensation gives rise to a conception of the apple as possessing a particular intrinsic property: the complex configuration of primary qualities that is hardness.

So, there is a difference between primary and secondary qualities for Reid, although he draws the distinction in an importantly different way from the way in which it was drawn by Locke. For both Locke and Reid, we are aware of objects as they are intrinsically only when our awareness is caused by the primary qualities of objects. But for Reid, and not for Locke, we are genuinely aware of objects as they are when our awareness results from the secondary qualities of objects; but we are aware of those objects only as they are *relative* to us, and not as they are in themselves.

Sensation, Natural Signs and Suggestion

The immediate effect that objects have on us is to cause sensations. Further, we become aware of the qualities of objects following the sensations that those objects cause. However, for Reid, the conceptions of objects that follow from our sensations are not *derived* from our sensations; our sensations, after all, generally do not bear any kind of resemblance to the qualities which cause them. That is, according to Reid, we don't conceive of objects as possessing particular qualities by, say, representing our sensations, or drawing conclusions about the world through some sort of scrutiny of our sensations. Rather, our sensations give rise to our conceptions of objects by a process that he calls "suggestion": the qualities of objects are "suggested" by our sensations and so when we have sensations we come to be aware of those objects as possessing those qualities. But what is suggestion supposed to be?

Suggestion is a pseudo-linguistic notion, for Reid. Signs suggest conceptions of that which they signify. The word "pigs", for instance, leads those who are familiar with the word to think of certain pinkish barnyard animals. However, we don't come to think of such creatures on encountering the word "pigs" by somehow scrutinizing the word and thereby locating, in the world, some object that has some peculiar fitness to the word. After all, the word "pigs" is utterly arbitrary. While there are probably reasons why it came to signify what it signifies, there is no similarity between pigs and the word "pigs": pigs have four legs, for instance, not four letters.

Reid draws a distinction between natural and artificial signs. Artificial signs signify what they signify as a result of some sort of compact or tacit agreement between people: "pigs" signify pigs, according to Reid, only because people have agreed to use a particular sound and a particular configuration of letters to signify pigs. Natural signs, on the other hand, signify what they signify for other reasons entirely. For instance, blushing signifies embarassment only because of the fact that blushing and embarassment are customarily found together. The connection between them, just like the connection between the word

"pigs" and pigs, is utterly arbitrary: were it the case that, when embarassed, people stamped their left feet, then the stamping of the left foot would signify embarassment. (In fact, the distinction between natural and artificial signs has a long history. It can be found in, at least, Locke, Hobbes, Gassendi and the Port Royal Logic.)

We discover that blushing is a sign of embarassment through experience in ourselves and others of the co-occurrence of the two states: it is because of our acquaintance with human nature and with the conjunction of blushing and embarassment that we think of embarassment when we encounter blushing. However, some natural signs lead us to think of what they signify without any experience whatsoever. Reid describes this category of natural signs in unhesitatingly mystical terms. He says that there is a category of natural signs

> which, though we never before had any notion or conception of the things signified, do suggest it, or conjure it up, as it were, by a natural kind of magic, and at once give us a conception, and create a belief of it. (*Inquiry*, ch. 5, section 3, p. 60)

Reid has an example in mind of a natural sign which works "magically" in this way: the sensation of hardness. This tactile sensation leads us immediately to conceive of that which caused it as being hard, as having a certain resistive construction. (Reid assumes, perhaps wrongly, that the quality of hardness is a non-relational quality.) But we are aware of this quality, in the object which caused the sensation, automatically, "as it were, by a natural kind of magic". We cannot hope to understand why it is that we think of this special kind of construction after having the right kind of tactile sensation, but must "conclude, that this connection is the effect of our constitution, and ought to be considered as an original principle of human nature" (*Inquiry*, ch. 5, section 3, p. 61). In fact, this is the defining feature of the kind of natural signs of which the tactile sensation of hardness is an instance: these are signs that lead us to conceive of what they signify simply because we are built in such a way as to have such conceptions on encountering such signs; such a tendency is an inescapable feature of our constitution.

When does one's conception of an object as having a particular quality amount to a perception, a conception accompanied by a conviction of its accuracy? The answer is: when one comes to have that conception because one has encountered a natural sign which leads one to the conception, and that natural sign leads one to the conception merely because of one's constitution. Conviction in the accuracy of a conception is bestowed on the conception, Reid thinks, just when the relevant conception comes about because of our nature or constitution. When we conceive of an object in a particular way merely because it is in our nature to conceive of the object that way, then the conception is non-optional, unavoidable, and is thus one that we cannot help but trust; the conception of an object which one has when one encounters a natural sign which signifies merely because of one's constition is given with one's consititution; we can no more reject it than we can give up our own humanity. Perceptions, then, are dictates of common sense: to be aware of an object in perception is to have a belief which you cannot give up given your constitution.

So, for Reid, in the standard case, a quality of an object impinges on our bodies causing a sensation that has no resemblance whatsoever to the quality. This sensation, in turn, leads us to conceive of the object as

having the quality -- and thus to be directly aware of the object as possessing the quality -- merely because we are wired in such a way as to have such a conception after having the sensation; that is what it is for the sensation to "suggest" the conception of the quality. And, further, since the conception comes to be had as a result of our natures as human beings, we cannot help but trust it, and thus we are convinced of its accuracy and can be said to be perceiving the object. However, there are non-standard cases, for there are sensations that do bear a resemblance to -- or, at least, are the rational result of-the qualities which cause them. In particular, certain aspects of visual sensation are like this.

Reid is very impressed by results in geometric optics and holds that while there is no similarity between sensations of color and the quality in objects which cause those sensations, there is a non-arbitrary connection between visual sensations of shape and size and the qualities of objects which cause those sensations. One could rationally determine the shape and size of an object given nothing but a particular visual sensation -- even understood just as a particular impression on the retina -- and the laws of geometric optics, together with a few other pieces of information (such as the distance from oneself to the object). Or, conversely, even a blind person could construct the features of the retinal impression of the shape and size of an object when equipped with information about the actual size and shape of the object, the location of the observer, and the laws of geometrical optics. (This point is controversial. Keith Lehrer presents an alternative interpretation under which Reid holds that not even visual sensations resemble their causes. See Lehrer, *Thomas Reid*, 1989.) But, visual sensations of shape and size are natural signs not of the actual, but rather of the apparent shape and size of objects: when we encounter a visual sensation, we are immediately aware (that is, aware because of our natures) of the object as having a particular *apparent* shape and size (and a particular color). Since the actual shape and size are deducible from the apparent shape and size, together with some further pieces of information, we often conceive of the actual shape and size immediately after conceiving of the apparent shape and size. In fact, this movement of the mind from the conception -- that is, *perception* -- of apparent shape and size to the conception of actual shape and size is so quick, and so hard to notice, Reid thinks, that it is much like, although not in fact, perception. It is not perception, strictly speaking, since it doesn't come to pass merely because of our natures -- and therefore the route through which we come to have the conception doesn't necessarily deliver to us a conviction in the conception's accuracy -- but, rather, in some cases, the conception of actual size and shape comes about through a process of reasoning. He calls such conceptions, in keeping with Berkeley's terminology, "acquired perception".

Our acquired perceptions needn't be, although they sometimes are, acquired through *reasoning* from those rare sensations -- namely, visual sensations -- that bear a rational relationship to certain qualities of objects -- namely the real size and shape of objects. We sometimes acquire a perception of an object as having a certain quality simply by correlating data from more than one sense. So, for instance, the real size and shape of objects are immediately suggested by our tactile sensations; such sensations are natural signs of those sizes and shapes and signify only because of our constitutions. However, since we often encounter certain visual sensations -- which are natural signs only of the apparent size and shape of objects -- together with tactile sensations, we come to infer that a body that is merely seen would give rise to a certain tactile sensation were it touched, a tactile sensation that is itself a natural sign of the real size and shape of the object. Thus we come to conceive of the object as possessing a particular actual size or shape merely on seeing it despite the fact that our visual sensations are not natural signs of actual size or

shape. Since such deliverances of conceptions do not come only from our nature, they do not, in general, bring with them a conviction of their accuracy. Even if we are convinced of their accuracy, such a conviction is not guaranteed by the history of their occurrence, as is the case in direct perception, but comes from some other source.

In summary, then, on Reid's view our minds come to be connected to the world in something like the way that we come to grasp objects through a language designed for the purpose. However, when we come to be aware of objects through our senses, we do so by utilizing something like a language embedded in our constitutions: our sensations function like a language that nature has constructed, and that nature has constructed us to understand, for the purpose of signifying real objects. So while it is in a sense only a metaphor to say that, for Reid, we know about the world because the world speaks to us, it is a metaphor that illuminates the facts as he sees them.

Responding to External World Skepticism

We are now in a position to understand the force of Reid's most important response to any argument purporting to show that the external world either might not exist, or might not be anything like the way we take it to be. In one canonical statement of his position, Reid says,

> The sceptic asks me, Why do you believe the existence of the external object which you perceive? This belief, sir, is none of my manufacture; it came from the mint of Nature; it bears her image and superscription; and, if it is not right, the fault is not mine: I even took it upon trust, and without suspicion. Reason, says the sceptic, is the only judge of truth, and you ought to throw off every opinion and every belief that is not grounded on reason. Why, sir, should I believe the faculty of reason more than that of perception? -- they came both out of the same shop, and were made by the same artist; and if he puts one piece of false ware into my hands, what should hinder him from putting another? (*Inquiry*, ch. 6, section 20, pp. 168-169)

The mistake that the skeptic makes, according to Reid, is to deny the truth of something that is demanded by our constitutions. To perceive an object as possessing a particular property is to have a conception of the object which was, itself, delivered by one's nature. What makes us convinced of the accuracy of the conceptions of objects involved in perception is that they arise from our constitutions. But, asks Reid here, why do we find skeptical arguments so compelling? Why do we accept that skeptical conclusions follows from, for instance, Descartes's hypothesis of the evil demon? Ultimately, we think that such arguments lead to their conclusions because we accept certain logical principles -- such as the law of non-contradiction, or modus ponens -- which appear to us to be self-evident. But to say that such principles are self-evident is just to say that we cannot help but accept them; it is to say only that we are compelled to believe them. But the irresistibility of a belief is a very good indicator, Reid thinks, that we hold that belief merely because of the way we are built, merely because of our constitution. But then the skeptic has merely placed the skeptical conclusion on the same footing as the common sense belief about the external world: both rest on something that we are compelled to believe by our constitutions. However, in

order to overthrow common sense, the skeptic must place the skeptical conclusion, rather, on a *firmer* footing than the common sense conclusion. Thus, the skeptic gives us no reason whatsoever to reject common sense beliefs about the external world.

Reid, therefore, takes himself to have defended common sense through construction of an epistemological model that serves as an alternative to the Lockean view and, he thinks, thereby manages to avoid denial of our conception of ourselves as creatures capable of knowing about a non-mental world directly through our senses, a denial which he takes the work of Berkeley and Hume to show to be the inevitable result of acceptance of the Lockean picture.

Scottish Philosophy in the Eighteenth Century

Philosophy was at the core of the eighteenth century movement known as the Scottish Enlightenment. The movement included major figures, such as Francis Hutcheson, David Hume, Adam Smith, Thomas Reid and Adam Ferguson, and also many others who produced notable works, such as George Turnbull, George Campbell, James Beattie, Alexander Gerard, Henry Home (Lord Kames) and Dugald Stewart. I discuss some of the leading ideas of these thinkers, though paying less attention than I otherwise would to Hume, Smith and Reid, who have separate Encyclopedia entries. Amongst the topics covered in this entry are aesthetics (particularly Hutcheson's), Moral philosophy (particularly Hutcheson's and Smith's), Turnbull's providential naturalism, Kames's doctrines on divine goodness and human freedom, Campbell's criticism of the Humean account of miracles, the philosophy of rhetoric, Ferguson's criticism of the idea of a state of nature, and finally the concept of conjectural history, a concept especially associated with Dugald Stewart.

Major figures

The major figures in Scottish eighteenth century philosophy were Francis Hutcheson, David Hume, Adam Smith, Thomas Reid and Adam Ferguson. Others who produced notable works included George Turnbull, George Campbell, James Beattie, Alexander Gerard, Henry Home (Lord Kames) and Dugald Stewart.

Hutcheson on aesthetics

The first of the major philosophers was Francis Hutcheson (1694-1746). His reputation rests chiefly on his earlier writings, especially *An Inquiry into the Original of our Ideas of Beauty and Virtue* (London 1725), *Reflections upon Laughter and Remarks on the Fable of the Bees* (both in the Dublin Journal 1725-6), and *Essay on the Nature and Conduct of the Passions with Illustrations on the Moral Sense* (London 1728). His magnum opus, *A System of Moral Philosophy*, was published posthumously in Glasgow in 1755; a modern critical edition is awaited. During his period as a student at Glasgow University (c.1711-17) Hutcheson studied moral philosophy and jurisprudence under Gershom Carmichael, and in 1730 he took up the moral philosophy chair left vacant on Carmichael's death. Hutcheson is known principally for his ideas on moral philosophy and aesthetics. First moral philosophy.

Hutcheson reacted against both the psychological egoism of Thomas Hobbes and the rationalism of Samuel Clarke and William Wollaston. As regards Hobbes, Hutcheson thought his doctrine was both wrong and dangerous; wrong because by the frame of our nature we have compassionate, generous and benevolent affections which owe nothing at all to calculations of self-interest, and dangerous because people may be discouraged from the morally worthy exercise of cultivating generous affections in themselves on the grounds that the exercise of such affections is really an exercise in dissimulation or pretence. As against Hobbes Hutcheson held that a morally good act is one motivated by benevolence, a desire for the happiness of others. Indeed the wider the scope of the act the better, morally speaking, the act is; Hutcheson was the first to speak of ‘the greatest happiness for the greatest numbers’.

He believed that moral knowledge is gained via our moral sense. A sense, as the term is deployed by Hutcheson, is every determination of our minds to receive ideas independently of our will, and to have perceptions of pleasure and pain. In accordance with this definition, the five external senses determine us to receive ideas which please or pain us, and the will does not intervene -- we open our eyes and by natural necessity see whatever it is that we see. But Hutcheson thought that there were far more senses than the five external ones. Three in particular play a role in our moral life. The public sense is that by which we are pleased with the happiness of others, and are uneasy at their misery. The moral sense is that by which we perceive virtue or vice in ourselves or others, and derive pleasure, or pain, from the perception. And the sense of honour is that which makes the approbation, or gratitude of others, for any good actions we have done, the necessary occasion of pleasure. In each of these cases the will is not involved. We see a person acting with the intention of bringing happiness to someone else, and by the frame of our nature pleasure wells up in us.

Hutcheson emphasises both the complexity of the relations between our natural affections and also the need, in the name of morality, to exercise careful management of the relations between the affections. We

must especially be careful not to let any of our affections get too ‘passionate’, for a passionate affection might become an effective obstacle to other affections that should be given priority. Above all the selfish affections must not be allowed to over-rule ‘calm universal benevolence’.

Hutcheson's opposition to Hobbesian egoism is matched by his opposition to ethical rationalism, an opposition which emerges in the *Illustrations upon the Moral Sense,* where he demonstrates that his account of the affections and the moral sense makes sense of the moral facts whereas the doctrines of Clarke and Wollaston totally fail to do so. Hutcheson's main thesis against ethical rationalism is that all exciting reasons presuppose instincts and affections, while justifying reasons presuppose a moral sense. An exciting reason is a motive which actually prompts a person to act; a justifying reason is one which grounds moral approval of the act. Hutcheson demonstrates that reason, unlike affection, cannot furnish an exciting motive, and that there can be no exciting reason previous to affection. Reason does of course play a role in our moral life, but only as helping to guide us to an end antecedently determined by affection, in particular the affection of universal benevolence. On this basis, an act can be called ‘reasonable’, but this is not a point on the side of the rationalists, since they hold that reason by itself can motivate, and in this case it is affection, not reason that motivates, that is, that gets us doing something rather than nothing.

If we add to this the fact, as Hutcheson sees it, that it has never been demonstrated that reason is a fit faculty to determine what the ends are that we are obliged to seek, we shall see that Hutcheson's criticism of rationalism is that it can account for neither moral motivation nor moral judgment. On the other hand our natural affections, in particular benevolence, account fully for our moral motivation and our faculty of moral sense accounts fully for our ability to make an assessment of actions whether our own or others'.

Certain features of Hutcheson's moral philosophy appear in his aesthetic theory also. Indeed the two fields are inextricably related, as witness Hutcheson's reference to the ‘moral sense of beauty’. Two features especially work hard. He contends that we sense the beauty, sublimity or grandeur of a sight or of a sound. The sense of the thing's beauty, so to say, wells up unbidden. And associated with that sense, and perhaps even part of it -- Hutcheson does not give us a clear account of the matter -- is a pleasure that we take in the thing. We *enjoy* beautiful things and that enjoyment is not merely incidental to our sensing their beauty.

A question arises here regarding the features of a thing that cause us to see it as beautiful and to take pleasure in it. Hutcheson suggests that a beautiful thing displays unity (or uniformity) amidst variety. If a work has too much uniformity it is simply boring. If it has too much variety it is a jumble. An object, whether visual or audible, requires therefore to occupy the intermediate position if it is to give rise to a sense of beauty in the object. But if Hutcheson is right about the basis of aesthetic judgment how does disagreement arise? Hutcheson's reply is that our aesthetic response is affected in part by the associations that the thing arouses in our mind. If an object that we had found beautiful comes to be associated in our mind with something disagreeable this will affect our aesthetic response; we might even find the thing ugly. Hutcheson gives an example of wines to which men acquire an aversion after they have taken them in an emetic preparation. On this matter his position may seem extreme, for he holds that if two people have the same visual experience and if the thing experienced carries the same identical associations for

the two people, then they will have the same aesthetic response to the visible object. The position is however difficult to disprove, since if two people do in fact disagree about the aesthetic merit of an object, Hutcheson can say that the object produces different associations in the two spectators.

Hutcheson, Hume and Turnbull

Hutcheson influenced most of the Scottish philosophers who succeeded him, perhaps all of them, whether because he helped to set their agenda or because they appropriated, in a form suitable to their needs, certain of his doctrines. In the field of aesthetics for example, where Hutcheson led, many, including Hume, Reid, and Archibald Alison, followed. But influences can be hard to pin down and there is much dispute in particular concerning his influence on David Hume (1711-76). It is widely held that Hume's moral philosophy is essentially Hutchesonian, and that Hume took a stage further Hutcheson's projects of internalisation and of grounding our experience of the world on sentiment or feeling. For Hume agreed with Hutcheson that moral and aesthetic qualities are really sentiments existing in our minds, but he also argued that the necessary connection between any pair of events E1 and E2 which are related as cause to effect is also in our minds, for it is nothing more than a determination of the mind, due to custom or habit, to have a belief (a kind of feeling) that an event of kind E2 will occur next when we experience an event of kind E1. Furthermore Hume argues that what we think of as the ‘external’ world is almost entirely a product of our own imaginative activity. As against these reasons for thinking Hume indebted to Hutcheson there are the awkward facts that Hutcheson greatly disapproved of the draft of *Treatise* Book III that he saw in 1739 and that Hutcheson did his best to prevent Hume being appointed to the moral philosophy chair at Edinburgh University in 1744-5. In addition many of their contemporaries, such as Adam Smith and Thomas Reid, held that Hume's moral philosophy was significantly different from Hutcheson's. (See James Moore, ‘Hutcheson and Hume’.)

But if there is ample room for doubt over whether major areas of Hume's philosophy are developments of, or are even compatible with, Hutcheson's thought, the same cannot be said of George Turnbull (1689-1749), regent at Marischal College, Aberdeen (1721-7), and teacher of Thomas Reid. In view of the fact that the subtitle of Hume's *Treatise of Human Nature* is ‘An attempt to introduce the experimental method of reasoning into moral subjects’, it should be noted that Turnbull's *Principles of Moral Philosophy*, published in 1740 (the year of publication of Bk. III of the *Treatise*) but based on lectures given in Aberdeen in the mid-1720s, contains a defence of the claim that natural and moral philosophy are very similar types of enquiry. When Turnbull tells us that all enquiries into fact, reality, or any part of nature must be set about, and carried on in the same way, he is bearing in mind the fact , as he sees it to be one, that there are moral facts and a moral reality, and that our moral nature is part of nature and therefore to be investigated by the methods appropriate to the investigation of the natural world. As the natural philosopher relies on experience of the external world, so the moral philosopher relies on his experience of the internal world. It is, in Turnbull's judgment, the failure to do this that led to the moral scepticism (as Turnbull thought it to be) of Hobbes and Mandeville, whose reduction of morality to self-love flies in the face of experience and is a shock to common sense.

The experience in question is of the reality of the public affection in our nature, the immediate object of

which is the good of others, and the reality of the moral sense by which we are determined to approve such affections. This moral sense, of whose workings we are all aware, is the faculty by which, without the mediation of rational activity, we approve of virtuous acts and disapprove of vicious ones; and the approval and disapproval rise up in us without any regard for self-love or self-interest. In a very Hutchesonian way Turnbull invites us to consider the difference we feel when faced with two acts which are the same except for the fact that one of them is performed from love of another and the other is performed from self-interest. These facts about our nature have to be accommodated within moral philosophy just as the fact that heavy bodies tend to fall has to be accommodated within natural philosophy.

Turnbull is committed to a form of reliabilism according to which the faculties that we have by the frame or constitution of our nature are trustworthy. It is not simply that we are so constructed that we cannot but accept their deliverances; it is that we are also entitled to accept them. Turnbull, a deeply committed Christian, believed that the author of our nature would not have so constituted us as to accept the deliverances of our nature if our nature could not be relied upon to deliver up truth. We are in the hands of providence, and live directed towards the truth for that reason. This doctrine has been termed ‘providential naturalism’, and bears a marked resemblance to the language and also to the substance of Reid's position.

Kames on aesthetics and religion

Henry Home, Lord Kames, likewise taught a version of providential naturalism. In his *Essays on the Principles of Morality and Natural Religion* he has a good deal to say about the senses external and internal, treating them as enabling us, by the original frame of our nature, to gain access, without the use of reasoning processes, to the realities in the corresponding domains, including the moral domain. Kames's moral sense has as much to do with aesthetics as with morality; or rather, for Kames, no less than for Hutcheson, virtue is a kind of beauty, moral beauty, as vice is moral deformity. Beauty itself is ascribed to anything that gives pleasure. And as there are degrees of pleasure and pain, so also there are degrees of beauty and ugliness. In the lowest rank are things considered without regard to an end or a designing agent. The possibility of greater pleasure, and of the ascription of greater beauty, arises when an object is considered with respect to the object's end. A house, considered in itself, might be beautiful, but how much more beautiful is it judged to be if it seen to be well designed for human occupancy.

Approbation, as applied to works of art, is our pleasure at them when we consider them to be well fitted or suited to an end. The approbation is greater if the end for which the object is well suited also gives pleasure. A ship may give pleasure because it is so shapely, and also give pleasure because it is well suited to trade, and also give pleasure because trade also is a fine thing. If these further thing are taken into account the beauty of the ship is enhanced. Kames argues that these kinds of pleasure can also be taken in human actions, and that human acts can cause pleasure additionally by the special fact about them that they proceed from intention, deliberation and choice. In the case of, for example, an act of generosity towards a worthy person, the act is intentionally well suited, or fitted, to an end whose beauty is recognised by the agent. The fact that observation of acts displaying generosity, and other virtues, gives

us pleasure is due to the original constitution of our nature. The pleasure arises unbidden, and no exercise of will or reason is required, any more than we require to use our reason to see the beauty of a landscape or a work of art.

Kames wrote extensively on revealed and natural theology. As regards the latter, he often has Hume in his sights, particularly Hume's *Dialogues Concerning Natural Religion* (1779), with whose contents Kames was familiar decades before the work's publication. Hume held that in an inference from effect to cause no more should be assigned to the cause than is sufficient to explain the effect. In particular, if we argue from the existence of the natural world to the existence of God we should ascribe to God only such attributes as are requisite for the explanation of the world. And since the world is imperfect, why not say that we are not constrained by the facts in the natural order to ascribe perfection to God? Kames, on the other hand, holds that there are principles implanted in our nature that permit us to draw conclusions that reason alone does not sanction. If something is a tendency of our nature then we have to rely on it as a source of truth. Invoking just such a tendency Kames affirms that though we see both good and evil around us we do not conclude that the cause of the world must also be a mixture of good and evil: ‘it is a tendency of our nature to reject a mixed character of benevolence and malevolence, unless where it is necessarily pressed home upon us by an equality of opposite effects; and in every subject that cannot be reached by the reasoning faculty, we justly rely on the tendency of our nature.’ (*Essays* p.353) In any case Kames sees a world which is predominantly good even though it has ‘a few cross instances’. But the few cross instances might not look so cross, or even at all cross, if we had a fuller perspective, and Kames anticipates the time when that perspective will be granted us.

This latter position did not raise the hackles of the zealots among the Presbyterian clergy in Scotland, but Kames's position on free will caused a furore and he had to defend himself from attempts to expel him from the Kirk. Kames, accepting the concept of history, natural and human, as the gradual realisation of a divine plan, believed in universal necessity. The laws ordained by God ‘produce a regular train of causes and effects in the moral as well as material world, bringing about those events which are comprehended in the original plan, and admitting the possibility of none other.’ (*Essays* p.192) On the other hand, if we are to fulfill our role in the grand scheme we must see ourselves as able to initiate things, that is, to be the free cause of their occurrence. God has therefore, according to Kames, concealed from us the necessity of our acts and he is therefore a deceitful God. Kames sought to explain how this divine deceit enables us to live as morally accountable beings, but this latter part of his philosophy did nothing to placate those in the Kirk for whom the affirmation of a deceitful God was a sacrilege. Kames, however, could not see any difference between the deception by which we believe ourselves to be free when in fact we are necessitated and the deception by which we believe secondary qualities, such as colours and sounds, to be in the external world and able to get along without us, when in fact they depend for their existence upon the exercise of our own sensory powers.

Campbell on miracles

Kames did not dedicate an entire book to an attack on Hume on religion, but George Campbell (1719-96) did. This interesting man, a student at Marischal College, Aberdeen, of which in 1759 he became

Principal, was a founder-member of the Aberdeen Philosophical Society, the ‘Wise Cub’, which also included Thomas Reid, John Gregory, David Skene, Alexander Gerard, James Beattie and James Dunbar. It is probable that many of Campbell's writings began life as papers to the Club. In 1763 he published *A Dissertation on Miracles* which was intended as a demolition of Hume's essay ‘On miracles’, Chapter Ten in *An Enquiry Concerning Human Understanding*. Miracles were commonly discussed in eighteenth century Scotland. On the one hand the Kirk required people to accept miracle claims on the basis either of eyewitness reports or of reports of such reports, and on the other hand the spirit of Enlightenment required that claims based on the authority of others be put before the tribunal of reason. Hume focuses especially on the credibility of testimony, and argues that the credence we place in testimony is based entirely on experience, the experience of the occasions when testimony has turned out to be true as against those experiences where it has not. Likewise it is on the basis of experience that we judge whether a reported event occurred. If the reported event is improbable we ask how probable it is that the eyewitness is speaking truly. We have to balance the probability that the eyewitness is speaking truly against the improbability of the occurrence of the event. Hume held that the improbability of a miracle is always so great that no testimony could tell effectively in its favour. The wise man, proportioning his belief to the evidence, would believe that the testimony in favour of the miracle is false.

Campbell's opening move against this argument is to reject Hume's premiss that we believe testimony solely on the basis of experience. For, according to Campbell, there is in all of us a natural tendency to believe other people. This is not a learned response based on repeated experience but an innate disposition. In practice this principle of credulity is gradually finessed in the light of experience. Once testimony is placed before us it becomes the default position, something that is true unless or until proved false, not false unless or until proved true. The credence we give to testimony is much like the credence we give to memory. It is the default position as regards beliefs about the past, even though in the light of experience we might withhold belief from some of its deliverances

Because our tendency to accept testimony is innate, it is harder to overturn than Hume believes it to be. Campbell considers the case of a ferry that has safely made a crossing two thousand times. I, who have seen these safe crossings, meet a stranger who tells me solemnly that he has just seen the boat sink taking with it all on board. The likelihood of my believing this testimony is greater than would be implied by Hume's formula for determining the balance of probabilities. Reid, a close friend of Campbell's, likewise gave massive emphasis to the role of testimony, stressing both the innate nature of the credence we give to testimony and also the very great proportion of our knowledge of the world that we gain, not through perception or reason, but through the testimony of others. Reid's comparison of the credence we naturally give to the testimony of others and the credence we naturally give to the deliverances of our senses, is one of the central features of his *Inquiry into the Human Mind* (1764).

Campbell and the rhetorical tradition

A number of eighteenth century Scots, including James Burnett (Lord Monboddo), Adam Smith, Thomas Reid, Hugh Blair and James Dunbar, made significant contributions in the field of language and rhetoric. George Campbell's *The Philosophy of Rhetoric* (London 1776) is a large-scale essay in which he takes a

roughly Aristotelian position on the relation between logic and rhetoric, since he holds that convincing an audience, which is the province of rhetoric or eloquence, is a particular application of the logician's art. The central insight from which Campbell is working is that the orator seeks to persuade people, and in general the best way to persuade is to produce perspicuous arguments. Good orators have to be good logicians. Their grammar also must be sound. This double requirement of orators leads Campbell to make a sharp distinction between logic and grammar, on the grounds that though both have rules, the rules of logic are universal and those of grammar particular. Though there are many natural languages there is but one set of rules of logic, and on the other hand different languages have different rules of grammar. It is against a background of discussion by prominent writers on language such as Locke and James (‘Hermes’) Harris that Campbell takes his stand with the claim that there cannot be such a thing as a universal grammar. His argument is that there cannot be a universal grammar unless there is a universal language, and there is no such thing as a universal language, just many particular languages. There are, he grants, collections of rules that some have presented under the heading ‘universal grammar’. But, protests, Campbell, ‘such collections convey the knowledge of no tongue whatever’. His position stands in interesting relation to Reid's frequent appeals to universals of language in support of the claim that given beliefs are held by all humankind.

Common sense

Campbell was a leading member of the school of common sense philosophy. For him common sense is an original source of knowledge common to humankind, by which we are assured of a number of truths that cannot be evinced by reason and ‘it is equally impossible, without a full conviction of them, to advance a single step in the acquisition of knowledge’. (*Philosophy of Rhetoric*, vol.1, p.114) His account is much in line with that of his colleague James Beattie: ‘that power of the mind which perceives truth, or commands belief, not by progressive argumentation, but by an instantaneous, instinctive, and irresistible impulse; derived neither from education nor from habit, but from nature; acting independently on our will, whenever its object is presented, according to an established law, and therefore properly called Sense; and acting in a similar manner upon all, or at least upon a great majority of mankind, and therefore properly called *Common Sense*.’ (*An Essay on the Nature and Immutability of Truth*, 40) We are plainly in the same territory as Reid's account: ‘there are principles common to [philosophers and the vulgar] which need no proof, and which do not admit of direct proof’, and these common principles ‘are the foundation of all reasoning and science’. (*Essays on the Intellectual Powers*, ed. Hamilton, vol.1, 230A-B)

These philosophers do however disagree about substantive matters. In particular, Reid lists as the first principle of common sense: ‘The operations of our mind are attended with consciousness; and this consciousness is the evidence, the only evidence, which we have or can have of their existence.’ (*Essays on the Intellectual Powers*, 231B) Campbell on the other hand lists three sorts of intuitive evidence. The first concerns our unmediated insight into the truth of mathematical axioms and the third concerns common sense principles. The second concerns the deliverances of consciousness, consciousness being the faculty through which we learn directly of the occurrence of mental acts -- thinking, remembering, being in pain, and so on. What is listed as a principle of common sense by Reid is, therefore, according to Campbell, to be contrasted with such principles. Aside from this, however, it is clear that Campbell is

philosophically very close to Reid, even if Reid is unquestionably the greater philosopher.

Smith on moral sentiments

Reid and Hume both owed an immense debt to Hutcheson. So also did Adam Smith (1723-90) who, unlike the others, studied under Hutcheson at Glasgow University. In 1751 Smith was appointed to the chair of logic and rhetoric at Glasgow and the following year transferred to the chair of moral philosophy that Hutcheson had occupied. Smith's *An Inquiry into the Nature and Causes of the Wealth of Nations* appeared in 1776. *Essays on Philosophical Subjects* appeared postumously in 1795. He also published an essay on the first formation of languages, and student notes of his lectures on rhetoric and belles lettres, and on jurisprudence have survived. But much his most important work in philosophy is the *Theory of Moral Sentiments* which appeared in 1759 and of which six authorised editions appeared during Smith's lifetime.

The concepts of sympathy and spectatorship, central to the doctrine of *TMS*, had already been put to work by Hutcheson and Hume, but Smith's account is distinct. As spectator of an agent's suffering we form in our imagination a copy of such ‘impression of our own senses’ as we have experienced when we have been in a situation of the kind the agent is in: ‘we enter as it were into his body, and become in some measure the same person with the agent.’ (*Theory of Moral Sentiments*, p.9) Smith gives two spectacular examples of cases where the spectator has a sympathetic feeling that does not correspond to the agent's. The first concerns the agent who has lost his reason. He is happy, unaware of his tragic situation. The spectator imagines how he himself would feel if reduced to this same situation. In this imaginative experiment, in which the spectator is operating on the edge of a contradiction, the spectator's idea of the agent's situation plays a large role while his idea of the agent's actual feelings has a role only in that the agent's happiness is itself evidence of his tragedy. The second of Smith's examples is the spectator's sympathy for the dead, deprived of sunshine, conversation and company. Again Smith emphasises the agent's situation, and asks how the spectator would feel if in the agent's situation, deprived of everything that matters to people.

Smith relates sympathy to approval. For a spectator to approve of an agent's feelings is for him to observe that he sympathises with the agent. This account is used as the basis of the analysis of propriety. For a spectator to judge that an agent's act is proper or appropriate is for him to approve of the agent's act. The agent's act lacks propriety, in the judgment of the spectator, if the spectator does not sympathise with the agent's performance.

Propriety and impropriety are based on a bilateral relation, between spectator and agent. Smith attends also to a trilateral relation, between a spectator, an agent who acts on someone, and the person who is acted on, the ‘recipient’ of the act. There are several kinds of response that the recipient may make to the agent's act, and Smith focuses on two, gratitude and resentment. If the spectator judges the recipient's gratitude proper or appropriate then he approves of the agent's act and judges it meritorious, or worthy of reward. If he judges the recipient's resentment proper or appropriate then he disapproves of the agent's act and judges it demeritorious, or worthy of punishment. Judgments of merit or demerit concerning a

person's act are therefore made on the basis of an antecedent judgment concerning the propriety or impropriety of another person's reaction to that act. Sympathy underlies all these judgments, for in the cases just mentioned the spectator sympathises with the recipient's gratitude and with his resentment. He has direct sympathy with the affections and motives of the agent and indirect sympathy with the recipient's gratitude; or in judging the agent's behaviour improper the spectator has indirect sympathy with the agent's resentment. (*Theory of Moral Sentiments*, p.74)

We have supposed, in each of these cases, that the recipient really does have the feeling in question, whether of gratitude or resentment. However, in Smith's account the spectator's belief about what the recipient actually feels about the agent is not important for the spectator's judgment concerning the merit and demerit of the agent. The recipient may, for whatever reason, resent an act that was kindly intentioned and in all other ways admirable, and the spectator, knowing the situation better than the recipient does, puts himself imaginatively in the shoes of the recipient while taking with him into this spectatorial role information about the agent's behaviour that the recipient lacks. The spectator judges that were he himself in the recipient's situation he would be grateful for the agent's act; and on that basis, and independently of the recipient's actual reaction, he approves of the agent's act and judges it meritorious. Here the spectator considers himself as a better (because better informed) spectator of the agent's act than the recipient is.

As regards judgments of merit and demerit, Smith sets up a model of three people, but the three differ in respect of the weight that has to be given to their work, for the recipient does almost nothing. He is acted on by the agent, but apart from that he is no more than a place holder for the spectator who will imaginatively occupy his shoes and make a judgment concerning merit or demerit on the basis solely of his conception of how he would respond to the agent if he were in the place of the recipient. He does not judge on the basis of the actual reaction of the recipient, who might approve of the agent's act or disapprove or have no feelings about it one way or the other.

Up to this point we have attended to the spectator's moral judgment of the acts of others. What of his judgment of his own acts? In judging the other the spectator has the advantage of disinterest, but he may lack requisite information and much of the work of creative imagination goes into his rectifying the lack. In judging himself he has, or may be presumed to have, the requisite information but he has the problem of overcoming the tendency to a distorted judgment caused by self-love or self-interest. He must therefore factor out of his judgment those features that are due to self-love. He does this by setting up, by an act of creative imagination, a spectator, an *other* who, *qua* spectator, is at a distance from him.The point about the distance is that it creates the possibility of disinterest or impartiality, but it is still necessary to ask how disinterest or impartiality is achieved if it is the agent himself who imagines the spectator into existence.

Let us move to an answer by wondering who or what it is that is imagined into existence? Is it the voice of society, representing established social attitudes? At times in the first edition of *The Theory of Moral Sentiments* Smith comes close to saying that it is. In the second edition Smith is clear that this is not the role of the impartial spectator for the latter can, and occasionally does, speak against established social attitudes. Nor can the judgment of the impartial spectator be reduced to the judgment of society, even where those two judgments coincide. Nevertheless the impartial spectator exists because of real live

spectators. Were it not for our discovery that while we are judging other people, those same people are judging us, we would not form the idea of a spectator judging us impartially.

The impartial spectator is a product of the imagination, and its mode of existence is therefore intentional -- it has what medieval philosophers termed *esse intentionale* as against *esse naturale*. In one sense therefore it should be thought of not as a real spectator who has the merit of being impartial, but as an ideal spectator in the sense of one that exists as an idea. In another sense the impartial spectator is real, for it is no other than the agent who is imagining it into existence.

Smith's account of justice is built upon his account of the spectator's sympathetic response to the recipient of an agent's act. If a spectator sympathises with a recipient's resentment at the agent's act then he judges the act demeritorious and the agent worthy of punishment. In the latter case the moral quality attributed to the act is injustice. An act of injustice ‘does a real and positive hurt to some particular persons, from motives which are naturally disapproved of’. (*Theory of Moral Sentiments* p.79) Since a failure to act justly has a tendency to result in injury, while a failure to act charitably or generously does not, a distinction is drawn by Smith, in line with Humean thinking, between justice and the other social virtues, on the basis that it is so much more important to prevent injury than promote positive good that the proper response to injustice is punishment, whereas we do not feel it appropriate to punish someone who does not act charitably or gratefully. In a word, we have a stricter obligation to justice than to the other virtues.

Though there are important points of contact between Smith's account of justice and Hume's, the differences are considerable, chief of them being the fact that Hume grounds our approval of justice on our recognition of its utility, and Smith does not. We do sometimes take it into account in coming to a judgment, but more often than not it is something of a quite different nature that wells up in us: ‘All men, even the most stupid and unthinking, abhor fraud, perfidy, and injustice, and delight to see them punished. But few men have reflected upon the necessity of justice to the existence of society, how obvious soever that necessity may appear to be.’ (*Theory of Moral Sentiments*, p.89) There are a few cases where utility is plainly involved in our judgment, but they are few, and they are in a distinct psychological class. Smith instances the sentinel who fell asleep while on watch and was executed because such carelessness might endanger the whole army. Smith's comment is: ‘When the preservation of an individual is inconsistent with the safety of a multitude, nothing can be more just than that the many should be preferred to the one. Yet this punishment, how necessary soever, always appears to be excessively severe. The natural atrocity of the crime seems to be so little, and the punishment so great, that it is with great difficulty that our heart can reconcile itself to it.’ (*Theory of Moral Sentiments*, p.90) And our reaction in this kind of case is to be contrasted with our reaction to the punishment of ‘an ungrateful murderer or parricide’, where we applaud the punishment with ardour and would be enraged and disappointed if the murderer escaped punishment. These very different reactions demonstrate that our approval of punishment in the one case and in the other are founded on very different principles.

Blair's Christian stoicism

Smith devotes considerable space to the Stoic virtue of self-command. Another eighteenth century

Scottish thinker who devotes considerable space to it is Hugh Blair (1718-1800), minister of the High Kirk of St Giles in Edinburgh and first professor of rhetoric and belles lettres at Edinburgh University. Blair's sermons bear ample witness to his interest in Stoic virtue. For example, in the sermon 'On our imperfect knowledge of a future state' he wonders why we have been left in the dark about our future state. Blair replies that to see clearly into our future would have disastrous consequences. We would be so spellbound by the sight that we would neglect the arts and labours which support social order and promote the happiness of society. We are, believes Blair, in 'the childhood of existence', being educated for immortality. The education is of such a nature as to enable us to develop virtues such as self-control and self-denial. These are Stoic virtues, and Blair's sermons are full of the need to be Stoical. In his sermon 'Of the proper estimate of human life' he says: 'if we cannot control fortune, [let us] study at least to control ourselves.' Only through exercise of self- control is a virtuous life possible, and only through virtue can we attain happiness. He adds that the search for worldly pleasure is bound to end in disappointment and that that is just as well. For it is through the failure of the search that we come to a realisation both of the essential vanity of the life we have been living and also of the need to turn to God and to virtue. For many, the fact of suffering is the strongest argument there is against the existence of God. Blair on the contrary holds that our suffering provides us with a context within which we can discover that our true nature is best realised by the adoption of a life-plan whose overarching principle is religious.

Ferguson and the social state

One of Blair's colleagues at Edinburgh University was Adam Ferguson (1723-1816). He succeeded David Hume as librarian of the Advocates' Library in Edinburgh and then held in succession two chairs at Edinburgh University, that of natural philosophy (1759-64) and of pneumatics and moral philosophy (1764-85). His most influential work is *An Essay on the History of Civil Society* (1767). Ferguson attended to one of the main concepts of the Enlightenment, that of human progress, and expressed doubts about whether over the centuries the proportion of human happiness to unhappiness had increased. He believed that each person accommodates himself to the conditions in his own society and the fact that we cannot imagine that we would be contented if we lived in an earlier society does not imply that people in earlier societies were not, more or less, as happy in their own society as we are in ours. As against our unscientific conjectures about how we would have felt in a society profoundly unlike the only one we have ever lived in, Ferguson commends the use of historical records. He talks disparagingly about boundless regions of ignorance in our conjectures about other societies, and among those he has in mind who speak ignorantly about earlier conditions of humanity are Hobbes, Rousseau and Hume in their discussions of the state of nature and the origins of society.

Hobbes and Rousseau in particular had a good deal to say about the pre-social condition of humankind. Ferguson argues, against their theories, that there are no records whatever of a pre-social human condition; and since on the available evidence humankind has always lived in society he concludes that living in society comes naturally to us. Hence the state of nature is a social state and is not antecedent to it.

Dugald Stewart on history and philosophy

One colleague of Blair and Ferguson at Edinburgh University was Dugald Stewart (1753-1828), who was a student first at Edinburgh, and then at Glasgow where his moral philosophy professor was Thomas Reid. Stewart succeeded his father in the chair of mathematics at Edinburgh, and then in 1785 became professor of pneumatic and moral philosophy at Edinburgh when Ferguson resigned the chair. Stewart shared with Ferguson an interest in the kind of historical (or pseudo-historical) writings to be found in Hobbes' *Leviathan* and Rousseau's *Contrat Social*. In his *Account of the Life and Writings of Adam Smith LL.D.* Dugald Stewart says of one of Smith's works, the *Dissertation on the Origin of Languages*, that ‘it deserves our attention less, on account of the opinions it contains, than as a specimen of a particular sort of inquiry, which, so far as I know, is entirely of modern origin’. (Smith, *Essays on Philosophical Subjects*, p.292) Stewart then spells out the ‘particular sort of inquiry’ that he has in mind. He notes the lack of direct evidence for the origin of language, of the arts and the sciences, of political union, and so on, and affirms: ‘In this want of direct evidence, we are under a necessity of supplying the place of fact by conjecture; and when we are unable to ascertain how men have actually conducted themselves upon particular occasions, of considering in what manner they are likely to have proceeded, from the principles of their nature, and the circumstances of their external situation.’ (*Essays on Philosophical Subjects* p.293)

For Stewart such enquiries are of practical importance, for by them ‘a check is given to that indolent philosophy, which refers to a miracle, whatever appearances, both in the natural and moral worlds, it is unable to explain’. (*Essays on Philosophical Subjects*, p.293) Stewart uses the term ‘conjectural history’ for the sort of history exemplified by Smith's account of the origin of language. Conjectural history works against the illegitimate encroachment of religion into the lives of people who are too quick to reach for God as the solution to a problem when extrapolation from scientifically established principles of human nature would provide a solution satisfying to the intellect. Knowing what we do about human nature, about our intellect and will, our emotions and fundamental beliefs, we ask how people would have behaved in given circumstances. Love and hate, anger and jealousy, joy and fear, do not change much through the generations. Much the same things, speaking generally, have much the same effect first on the emotions and then on behaviour. Dugald Stewart formulates the principle underlying conjectural history: it has ‘long been received as an incontrovertible logical maxim that the capacities of the human mind have been in all ages the same, and that the diversity of phenomena exhibited by our species is the result merely of the different circumstances in which men are placed’. (Stewart, *Collected Works*, ed. William Hamilton vol.1, p.69)

As regards the credentials of Stewart's ‘incontrovertible logical maxim’, if the claim that human nature is invariant is an empirical claim, it must be based on observation of our contemporaries and on evidence of people's lives in other places and at other times. Such evidence needs however to be handled with care. The further back we go the more meagre it is, and so the more we need to conjecture to supplement the few general facts available to us. Indeed we can go back so far that we have no facts beyond the generalities that we have worked out in the light of our experience. But to rely on conjecture in order to support the very principle that forms the first premiss in any exercise in conjectural history is to come

suspiciously close to arguing in a circle. The incontrovertible logical maxim of Dugald Stewart should probably be accorded at most the status of a well-supported empirical generalisation.

Conjectural history is certainly not pure guesswork. We argue on the basis of observed uniformities, and the more experience we have of given uniformities the greater credence we will give to reports that speak of the occurrence of the uniformities, whether they concern dead matter or living people and their institutions. In a famous passage Hume writes: ‘Whether we consider mankind according to the difference of sexes, ages, governments, conditions, or methods of education; the same uniformity and regular operation of natural principles are discernible. Like causes still produce like effects; in the same manner as in the mutual action of the elements and powers of nature.’ (*Treatise* p.401)

For Hume the chief point about the similarity between ourselves and our ancestors is that histories greatly contribute to the scientific account of human nature by massively extending our otherwise very limited observational data base. Hume writes: ‘Mankind are so much the same, in all times and places, that history informs us of nothing new or strange in this particular. Its chief use is only to discover the constant and universal principles of human nature, by showing men in all varieties of circumstances and situations, and furnishing us with materials from which we may form our observations and become acquainted with the regular springs of human action and behaviour. These records of wars, intrigues, factions, and revolutions, are so many collections of experiments, by which the politician or moral philosopher fixes the principles of his science, in the same manner as the physician or natural philosopher becomes acquainted with the nature of plants, minerals, and other external objects, by the experiments which he forms concerning them.’ (*Enquiry Concerning Human Understanding* 83-4) On this account of history, it is perhaps the single most important resource for the philosopher seeking to construct a scientific account of human nature. Among the historians produced by eighteenth century Scotland were Turnbull, Hume, Smith and Ferguson. In light of Hume's observation it is not surprising that so much history was written by men prominent for their philosophical writings on human nature.

The Biological Notion of Self and Non-self

Fundamental to biology are (1) defining the characteristics of identity which distinguish individual organisms from those of similar kind, and (2) describing the mechanisms that defend organisms from their predators. Immunology is the science devoted to these problems. A progeny of late 19th-century pathology and microbiology, immunology did not attain a formal theoretical construction until after World War II, when “the self” was introduced to provide a ready and convenient metaphor for deciphering immune reactivity. In the original formulation, normally, host constituents are ignored by the immune system, while “the other”—pathogens, foreign substances, altered host elements—are processed and destroyed. By the late 1970s, “the self” became the foundation of immune theorizing, and immunology dubbed itself the science of “self/non-self discrimination.” But this dominant model has recently been challenged, for the self is polymorphous and ill-defined. Contemporary transplantation biology and autoimmunity have demonstrated phenomena that fail to allow strict adherence to such a dichotomy of self/non-self, and as new models are emerging, “the self” has been left exposed as a metaphor, whose grounding—philosophically and scientifically—is unsteady and thus increasingly elusive as the putative nexus of immunology's doctrines.

Introduction

At an important nexus of pathology, clinical medicine, and basic biology, immunology has served

several research agendas and thus defies a single, unifying experimental framework. Rather it is (and has been) characterized by multiple, even competing thought-styles (Crist and Tauber 1997), each requiring a different methodological apparatus to order its experimental program. But underlying each branch of immunology, the concept of an identified and protected "self," a theoretical construction and fecund metaphor, has served as the central theme which integrates this diverse discipline. Indeed, the fate of "the self" in immunology offers a historical understanding of how the science has evolved.

Immunology during the first half of the twentieth century was pre-occupied with the more focused chemical questions of immune specificity, and the broader biological questions concerning immune identity remained unformulated. But after World War II, transplantation and autoimmunity became increasingly relevant both to basic immunologists and clinicians. These later concerns required a theoretical apparatus that explicitly addressed the question of biological identity and individuality. It was at this juncture that Sir Frank Macfarlane Burnet introduced the "self" into the immunological lexicon (Burnet and Fenner 1949), and upon that metaphor erected a theory of immunological tolerance that still dominates the field.

"Tolerance" refers to the immune system's "silence" to potential targets of destruction, thus allowing host constituents and some foreign elements an adopted co-equal status within the organism. Tolerance and autoimmunity are two sides of the proverbial coin: In one instance, the immune system is seen to ignore the host, and even foreign components, while in the other modality, the immune system attacks what is regarded by the outside observer as "self." These findings challenged the notion of a "one-directional" schema of immune reactivity, for tolerance was shown to be more than a passive silence of immune function, but required a more complex balance of responses. By the 1990s, immunologists increasingly appreciated that an immune self, representing a fortress from which attacking lymphocytes might sally forth to destroy invaders, offered a naive depiction of what was, in fact, a dynamic equilibrium in which "attacked" and "tolerated" were not easily predicated.

The simple model of immunity as committed to discerning those mechanisms by which the "self" discriminates host elements from the foreign requires revision. No longer is the identity of the host organism given or assumed, and, indeed, immune selfhood embraces diverse definitions. The designation of "self" and the "other" ignores that such neat divisions or boundaries were adopted, or at best, were drawn with a certainty that remained problematic. In fact, early discrepancies accompanying the full embrace of a self/non-self discriminatory mode to explain immune function remain vexing. So, while in Burnet's original formulation, the host organism, perceiving an invasion by microbial pathogens, mounts a defensive response, contemporary immunology has broadened this agenda to include surveillance of the body for malignant, effete, damaged, or dead host constituents (altered "normal" cells), as well as auto-immune processes directed against undamaged elements—some of which may be part of ordinary physiological economy, while others are pathological. The challenges to define a basis for immune identity, within the coupled ambiguities of autoimmunity and tolerance, has consequently generated debate about selfhood as an organizing concept for the discipline.

So when immunology is summarily defined as the science of self/non-self discrimination, and Burnet's theory by which selfhood is currently understood, "with only slight modification…has passed from the

status of theory to that of paradigm" (Golub and Green 1991, p. 15) and "no longer a theory but a fact" (Klein 1990, p. 335), a vast body of experimental data and explanation is ignored. Despite such dogma, the immune self, an implicit entity in the late 19th century (Tauber and Chernyak 1991; Mazumdar 1995), has became a hotly contested one today (Langman 2000), and offers a rich philosophical topic, both in terms of its epistemological standing, as well as its metaphysical foundations (Tauber 1994; 1999).

This article will outline, in a historical analysis, the two principle theories governing immunology's research program—the theory of immune identity, and a more recent one that challenges the very notion of selfhood. (Critics of this reading [Cohn 1998a; 1998b; Howes 1998] have been answered elsewhere [Tauber 1998b; 1999; 2000]). In those theoretical constructions are reflected the prevailing attempts to define the concept of organism. Note, while the immune self is rooted historically in the problematics of biological individuality (Loeb 1945; Buss 1987), its philosophical attention is distinct from those concerns (Wilson 1999) and subsumed to the broader questions of reductionism.

Historical Antecedents

The first medical use of the term "immunity" (originally a legal designation conferring exemption and distinction) appears in 1775, when Van Sweiten, a Dutch physician, used "immunitas" to describe the effects induced by an early attempt at variolization (Moulin 1991, p. 24). But the concept was not developed until the mid-19th century, when Claude Bernard set the theoretical stage for the autonomous organism (E. Cohen 2001). In contradistinction to an animal in humoral balance with a pervasive environment, Bernard postulated the primacy of the organism's essential independence. Physiology became the mode of inquiry for medical experimentation, one that instantiated a reductive strategy based on positivist principles. Later, biochemistry and genetics pursued this methodological and theoretical approach, thereby providing medicine with its modern experimental basis.

Bernard furnished biology with a new concept of the organism, one which would have wider ramifications than the establishment of a scientific method. Obviously, interchange with the environment was a necessary requirement for life, but Bernard emphasized how boundaries provided the crucial metabolic limits required for normal physiological function. With his concept of the *milieu interieur*, the body was envisioned as a demarcated, inter-dependent yet autonomous entity ("corporeal atomism" [E. Cohen 2001, p. 190]), thereby establishing the theoretical grounding that became the *sine qua non* for the development of the models for infectious diseases, genetics, neurosciences, and immunology in all of its various guises. He thus introduced a revolutionary approach to the study of the organism, and immunology became one of its defining sciences, indeed, immunity was alien to the older humoral view.

> Given the inclusive and fluid metaphoric system underlying pre-modern medicine, to speak of "immunity" with respect to embodied states would not only be improper but nonsensical. If disease signified a relation among elemental qualities and humors that were materially constitutive of both the living organism and its life context, then "exemption from" on the model of juridico-political immunity would be a non sequitur at best. (E. Cohen 2001, p. 183)

By radically changing the inside/outside topology so that the organism's interior becomes the determining context of function, Bernard effectively isolated the organism from its environment, and joined a complex cultural movement of redefining the body more generally.

Bernard's notion of the body as independent of the environment complemented Malthusian economics, liberal political philosophy, and Comtian sociology. From these and other disparate sources, the autonomous body as a political, social, economic and medical entity was redefined in the 19th century (Foucault 1973; Agamben 1998), and Bernard played a central role in providing a theoretical biological foundation for its critical use in various discourses. Notwithstanding that “independence” is a political term, and neither fairly represents the dialectical relationships of the organism and its environment (Levins and Lewontin 1985), nor the evolutionary peculiarities of individuality itself (Buss 1987), the formulation has served as the touchstone for various cultural constructions of identity. Indeed, culture critics have seized on immunology as paradigmatic for the modern notions of identity, where boundaries are contested and the body becomes the localized site of battle between self and other (Haraway 1989, Martin 1994). The warfare metaphors—“attack,” “defense,” “invaders”—so prevalent in immunology's lexicon, dramatically illustrate this construction, both in terms of the self/other dichotomy, as well as the privileged regard of individuality over community.

Origins of the Immune Self

Immunology's history is generally regarded as intimately tied to those discoveries leading to the elucidation of the bacterial etiology of infectious diseases, which draws together twin disciplines—microbiology, the study of the offenders, and immunology, the examination of host defense. Thus, in this pathological context, immunology began as the study of how a host animal reacts to pathogenic injury and defends itself against the deleterious effects from such microbial insult. This is the typical historical account of immunology as a clinical science, a tool of medicine, and as such it focused almost exclusively on the role of immunity as a defender of the infected. The paradigmatic host is the patient, an infected “self,” which is the critical element for the power of this view. The clinical orientation, which *assumes* a given entity—the self—is obviously a dominant organizing perspective, but another perspective turns this assumption into a question or a problem: Rather than the science that seeks to discern the basis of self/non-self discrimination, immunology may also be regarded as more fundamentally concerned with the *establishment* of organismal identity.

This latter point of view was offered by Elie Metchnikoff, who came to the nascent field of immunology from an unexpected theoretical and methodological perspective—an embryologist, who sought to discover genealogical relationships in the context of Darwinism (Tauber and Chernyak 1991; Gourko, Williamson, and Tauber 2000). Intrigued with the problem of how divergent cell lineages were integrated into a coherent, functioning organism, Metchnikoff was thus preoccupied with the problems of development as process, which he regarded as analogous to Darwinian inter-species struggle: Cell lineages were inherently in conflict to establish their own hegemony, but unlike nature writ large he hypothesized that a regulatory system was required to impose order, or what he called “harmony” on the

disharmonious elements of the animal. He found such an agent in the phagocyte, which retained its ancient phylogenetic eating function, to devour effete, dead, or injured cells that violated the phagocyte's sense of organismal identity. When pathogenic microbes were discovered in the 1870s, Metchnikoff soon applied the phagocyte the new role of defending the organism against invaders. Indeed, on this view, the phagocyte became an exemplar combatant of Darwinian struggle, now occurring within the organism.

In Metchnikoff's theory, immunity was a particular case of physiological inflammation, a normal process of animal economy. But there was a more subtle message: 1) immunity was an active process with the phagocyte's response seemingly mounted with a sense of independent arbitration, and 2) organismal identity was a problem bequeathed from a Darwinian perspective that placed all life in an evolutionary context. In short, Metchnikoff combined a Darwinian sensibility to a Bernardian conceptualization of autonomy.

Metchnikoff's overall representation constituted the phagocyte as an *agent* (Crist and Tauber 2001), an actor that is the cause of its own action—as a matter of endogenously generated and directed behaviors. The portrayal of the phagocyte as autonomous is largely derivative from the linked features of its capacity to sense its environment and move freely within it, and the various degrees of unpredictability and meaningfulness that characterize this behavior. The play of these features assemble an entity that is irreducibly the center of its own actions, one seen as analogous to the more complex organism with multiple functions: sensibility, locomotion, engulfment, ingestion, digestion, and excretion. Indeed, the phagocyte, as an agent, becomes a metaphorical “self,” a primordial microcosmic expression of what later immunologists would extend into an epistemology of biological identity. But while placing the identity function at the core of immunology's concerns, Metchnikoff failed to provide the necessary pre-conditions for those who would seek to demonstrate those reactions that conferred protection of such an *entity*. Much of the subsequent history of immunology may be traced to the attempts of establishing a definition of organismal identity and providing an experimental basis that would describe identity-making functions. These were scientific aspirations 19th-century biology could not fulfill.

Twentieth Century Constructions of the Immune Self

The first half of 20th-century immunology was devoted to establishing the chemical basis of immunity, leaving the parameters of selfhood tacit and assumed (Silverstein 1989). This chemical perspective dominated immunology until shortly after World War II, when transplantation and autoimmunity became increasingly relevant both to basic immunologists and clinicians. It was at this juncture that Sir Frank Macfarlane Burnet formally introduced the “self” into the immunological lexicon, and upon that metaphor erected a theory of immunological tolerance that was to henceforth dominate the field (Burnet and Fenner 1949; Tauber 1994). From this perspective, the foreign is destroyed by immune cells and their products, whereas the normal constituents of the animal are ignored. In other words, the host organism was a given identity within the Bernardian construct, one with implicit boundaries as defined by immune reactivity. What was “attacked” was “other;” that which was regarded by immune silence

became “the self.”

As currently understood, "self" and "nonself" may be discerned by either arm of the immune system. The more phylogenetically ancient phagocyte and its associated recognition proteins (together comprising the components of 'innate immunity') rely on at least three strategies to distinguish the host from "other" (Medzhitov and Janeway, 2002): 1) Recognizing "microbial nonself" depends on the ability of the host to identify conserved products of microbial metabolism that are unique to pathogens and are not produced by the host animal. These invariant structures are referred to as pathogen-associated molecular patterns, and their recognition plays a crucial role in host defense against bacteria. 2) Identifying "missing self" relies on the detection of "markers of normal self" which are dedicated gene products and metabolic products unique to the host. Missing such markers may initiate immune destruction, whereas recognizing such normal self-markers requires that immune reactivity is coupled to inhibitory pathways of immune activation. (Interestingly, certain microbes have assumed such markers by horizontal gene transfer to encode self-markers and thus avoid detection.) 3) Markers of "altered self" may be induced by infection and cellular transformation, so when such "neo-antigens" arise they become targets for immune destruction. This mechanism is the principle "house cleaning" function of phagocytes that ingest apoptotic (dying) and necrotic (dead) cells.

Historically, the innate system has not been the focus of immunology, and, correspondingly, the mechanisms of how the innate immune system distinguishes self and nonself have only recently been discerned. Immunologists have, instead, been preoccupied with lymphocyte biology, whose so-called mechanisms of "acquired immunity" are characterized by the ability to 1) mount an increasingly robust immune reaction once appropriate lymphocytes "learn" of pathogen insult, and 2) "remember" such insult so that upon repeated invasion, the lymphocyte-antibody response is both quickened and augmented. This was the immunology that intrigued Burnet, who was intent on explaining how immune reactivity develops in three stages - recognition, amplification, and memory - and more fundamentally, how self and nonself were discerned by this system. He invoked "tolerance" to explain how auto-destructive immune reactivity was controlled, or more specifically, he proposed a hypothesis that might explain how the immune system ignores host constituents. He thereby provided immunology with a theory of the self: Tolerance, the negative image of the self (or that which is absent in the space of immune recognition), became the central motif of understanding immune reactivity.

Unlike Metchnikoff, Burnet sought a firm definition of the immune self. Burnet's theory proposed that the animal, during prenatal development, exercised a purging function of self-reactive lymphocytes (the cells responsible for synthesizing reactive antibodies and mediating so-called cellular reactions) so that all antigens (substances that initiate immune responses) encountered during this period would attain a neutrality status. Thus lymphocytes with reactivity against host constituents are putatively destroyed during development, and only those “tolerant” lymphocytes that are non-reactive are left to engage the antigens of the foreign universe. Accordingly, potentially deleterious substances would select lymphocytes with high affinity for them, and through clonal amplification a population of lymphocytes differentiates and expands to combat the offending agents. The hypothesis (first presented in 1949 and later developed into the “clonal selection theory” (CST [Burnet 1959]) contained two key challenges which dominated contemporary immunology: 1) How was tolerance induced and auto-immunity

controlled? and 2) What was the mechanism that accounted for antibody and lymphocyte diversity? The latter issue was solved by molecular biologists by the mid-1980s (Podolsky and Tauber 1997); the former question, involving systems analysis, apparently requires a comprehensive model of the immune system as a whole and while theories of immune tolerance abound, the issue remains unresolved.

Aside from incomplete accounts of tolerance, there were early discrepancies arising from a continuum of auto-immune reactions, ranging from normal physiological and inflammatory processes to uncontrolled disease initiated by an immune reaction gone awry.

> During this century, the evolution of concepts on autoimmunity could be summarized by "never, sometimes, always." Thus from the early "horror autotoxicus" [Ehrlich] to the 1960s, immune autoreactivity was simply not considered…. With the first identification of autoreactive antibodies in patients and the subsequent conceptual association with autoaggressive immune behaviors, the "sometimes" phase was entered, necessarily equated with disease. By this time, immunology had laid its foundation on the clonal selection theory, which forbids autoreactive clones in normal individuals. Immunologists thereafter devoted 30 years discovering ways by which autoreactive lymphocyte clones can be deleted and why they fail to be deleted in autoimmune patients…. In the 1970s at least three sets of observations and ideas began to alter this course of events and to herald the "always" period. (Coutinho and Kazatchkine 1994, pp. 1-2)

Bountiful evidence in recent years has shown that autoimmunity is also a normal finding, and in these newer views, such functions are regarded as integrated within a more complex normal physiology (Schwartz and Cohen 2000; Horn et al 2001). Thus, immune reactivity, rather than functioning only in an "other-directed" mode is in fact bidirectional. This position contrasts with the "one-way" definition of selfhood, where there is a genetic self, whose constitutive agents see the foreign, and immune reactivity arises from this polarization with attack directed only against non-self (Tauber 1998a). Not unexpectedly, in this turn inwards, the immune self becomes increasingly difficult to define, unable to accommodate these new appraisals easily. There are at least half a dozen different conceptions of what constitutes the immune self (Matzinger 1994, p.993): 1) everything encoded by the genome; 2) everything under the skin including/excluding immune "privileged" sites; 3) the set of peptides complexed with T-lymphocyte antigen-presenting complexes of which various sub-sets vie for inclusion; 4) cell surface and soluble molecules of B-lymphocytes; 5) a set of bodily proteins that exist above a certain concentration; 6) the immune network itself, variously conceived (detailed below). While these versions may be situated along a continuum between a severe genetic reductionism and complex organismal constructions (Tauber 1998; 1999), each shares an unsettled relationship to Burnet's original dichotomous model of self and other (Langman 2000).

The Deconstruction of the Immune Self

Well before the current debate about the immune self, Niels Jerne attempted to dispel the many ad hoc caveats and paradoxes encumbering it by deconstructing the self concept altogether. He went beyond the

current notion of the immune network composed of lymphocyte subsets, secreting immuno-stimulatory and inhibitory substances (essentially a simple mechanical model with interlaced, first order feedback loops) to propose a novel conception of immune regulation (Jerne 1974). His network theory was, from its very inception, a complex amalgam of fitting the pieces of the regulation puzzle in place, with an overriding desire of understanding the immune system as a cognitive enterprise, one that spawned different formulations (e.g., Varela et al 1988; Atlan and Cohen 1989; Stewart 1994a). In introducing this metaphoric construction of the immune system as analogous to the nervous system as early as 1960, Jerne set the stage for understanding newer immune metaphors—recognition, memory, learning—which built on that parallel with human cognition.

Jerne's idiotypic network theory hypothesis proposed that antibodies formed a highly complex interwoven system, where the various specificities “referred” to each other (Jerne 1974). Under the general rubric of “cognition,” he conceived of the immune system as self-regulating, where antibody not only recognizes foreign antigen, but is capable of recognizing self constituents as antigens (the so-called idiotopes). There was no essential difference between the “recognized” and the “recognizer,” since any given antibody might serve either, or both, functions. In other words, immune regulation was based on the reactivity of antibody (and later lymphocytes) with its own repertoire forming a set of self-reactive, self-reflective, self-defining immune activities. Strong experimental support notwithstanding (Horn et al 2001), the relative importance of Jerne's network compared to other systems models remains contested, not the least for it radical reformulation of immune identity.

According to Jerne's model, the “self” and “other” dichotomy collapses, for the system is complete unto itself. Consisting of interlocking recognizing units, each component reacts with certain other constituents to form a complex network. When the system is perturbed by the introduction of a substance that is “recognized” (i.e., it reacts with a members of the system), this disturbance initiates the immune response. Thus foreignness per se does not exist in this formulation. In short, the system “knows” only itself. In Burnet's simplified world of self/non-self discrimination, the immune system learned host/foreign distinctions, generated an army of reactive antibody and lymphocytes, and acted accordingly when “antigen” was encountered. But Jerne coupled the simple antibody-antigen interactions to the far more complex and non-discriminatory functions of the immune system that built upon self-recognition. On his view, “autoimmunity,” instead of an aberrancy, became the organizational rule to explain immune function. Strikingly, there is no explicit mechanism for self/non-self discrimination, and this apparent lacuna served as the nexus of critiques (reviewed in Podolsky and Tauber 1997; Tauber 1999; 2000). But for Jerne, the need to define the “self” as distinct from the “other” receded from his primary theoretical concerns, and this posture was to have important repercussions.

When the immune system is regarded as essentially self-reactive and interconnected, the “meaning” of immunogenicity, that is reactivity, must be sought in some larger framework. Antigenicity then is only a question of degree, where “self” evokes one kind of response, and the “foreign” another, based not on its intrinsic foreignness, but rather because the immune system sees that foreign antigen in the context of invasion or degeneracy. There is no foreignness per se, because if a substance was truly foreign, it would not be recognized, i.e., there would be no image by which the immune system might engage it. So in the Jernian network, “foreign” is defined as perturbation of the system above a certain threshold. Only as

observers do we designate “self” and “non-self.” From the immune system's perspective, it only “knows” itself (Varela et al 1988). In this scheme, the immune system both disqualifies and abdicates any responsibility for discriminating “self” and “other.” Indeed, for Jerne, if one “needed” a self, it was the immune system itself. Most importantly, the singular defensive purpose of immunity was widened to include an array of physiological functions, each of them now regarded as fully integrated within the immune system itself (Matzinger 1994; Anderson and Matzinger 2000a; 2000b). If eventually successful, this move heralds a decisive shift in immunology's theoretical foundations, one more attuned to the diversity of immune functions which contribute to evolutionary fitness (I. Cohen 1992; 1994; Stewart 1994a). While host defense is a critical function, it is hardly the only one of interest. Indeed, the immune system might be regarded as primarily fulfilling an altogether different role if its phylogeny is carefully examined. On this basis, John Stewart has provocatively suggested that the immune system became defensive only after its primordial neuroendocrine communicative capabilities (Rabin, 1999; Ader, Felton, and Cohen 2001) were usurped for ‘immunity’ (Stewart 1994b).

In this spirit, Irun Cohen, and other contemporary theorists, refer to an “immune dialogue,” where the immune system continuously exchanges molecular signals with its interlocutor, the body (I. Cohen 1992; 1994). This “contextualist sensibility” highlights attention to complex systems that function in a self-organizing, dialectical interchange within itself (however its boundaries are drawn) *and* with its “outside” world (Levins and Lewontin 1985). No longer content with only defining the elements of the system and the local interactions of those components, biologists have increasingly come to appreciate that such systems are highly integrated within larger wholes and require analysis of how adjustments are made in relation to these other systems. This means, simply, that immune reactivity is determined by context (I. Cohen 1994; Podolsky and Tauber 1997; Grossman and Paul 2000), where agent and object play upon each other. In other words, as applied to the problem of self/non-self discrimination, from this ecological perspective, there can be no circumscribed, self-defined entity that is designated the Self, but rather there is an organism that is under constant challenge to respond along a continuum of behaviors, and it adapts and changes accordingly. In the case of the immune system, reactivity may vary from a full fledged immune response to mild irritation to quiescence.

Powerful molecular support for this contextual (or in another sense, ecological) orientation has been gathered. Consider the dominant model concerning lymphocyte activation, where it is generally appreciated that specific recognition of antigen by a lymphocyte receptor is not sufficient for activation, and that additional signals determine whether a cellular response or cell inactivation follows. In short, an antigen is neither self nor non-self except as it attains its “meaning” within a broader construct. Orthodox immune theory encompasses this idea in the so-called “two-signal model,” which does not require any of Jerne's hypotheses to fulfill its agenda. But there are more radical readings of the “contextualist” setting by which antigens are sensed, and debate concerning what constitutes the milieu of “meaning” of antigenicity and ensuing reaction have spawned certain provocative, and potentially important models of immune regulation (reviewed in Podolsky and Tauber 1997; Tauber 2000).

But Why Does the Immune Self Linger?

If we look at the “big picture,” as a chapter of biology, immunology is, on the one hand, adjusting to the twin demands of increasing molecular elucidation, and, on the other hand, an “ecological” sensibility. In both contexts, the “self” has slipped into an archaic formulation: From the molecularists' perspective, atomic delineations have outstripped explanations of immune regulation so that no molecular “signature” of selfhood suffices to explain the complex interactions of immunocytes, their regulatory products, and the targets of their actions. Reactivity has become the functional definition of immune identity. But when non-reactivity occurs, this may be because of active or implicit tolerance, which in turn is determined by many factors beyond Burnet's original formulation. Indeed, a new metaphor, “danger,” has been introduced to account for the integration of the immune system into the body as a whole, so that immune reactivity is regarded as determined not by a police function arbitrating self and non-self, but rather as a response to repair damage and defend against further deleterious agents of any kind—microbial, chemical, mechanical, etc. (Matzinger 1994).

When perceived as an attack on the centrality of self/non-self discrimination, much controversy has ensued (e.g., Langman 2000). While some detractors have generously called for a pluralistic approach (Vance 2000), and others have regarded the crisis over the self as overblown (e.g., Silverstein and Rose 2000), most would agree, at the very least, that immune selfhood is increasingly a polymorphous and ill-defined construct. Contemporary transplantation biology and autoimmunity have demonstrated phenomena that fail to allow faithful adherence to a strict dichotomy of self/non-self discrimination (Horn et al, 2001), and as new models are emerging, the immune self has been left exposed as a metaphor, whose grounding is unsteady and thus increasingly elusive as the putative nexus of immunology's doctrines. Quite simply, the immune system, now regarded as fully integrated with all the systems of the organism, no longer is seen as exclusively serving a separate “policing” function, one that protects *a* Self. Instead of searching for criteria of “self” and “other,” immune responses are increasingly studied as arising within a complex context which determines reactivity or dormancy. Self/non-self discrimination recedes as a governing principle when immunity is appreciated as both “outer-directed” against the deleterious, and “inner-directed” in an on-going communicative system of internal homeostasis. From this dual perspective, immune function falls on a continuum of reactivity, where the character of the immune “object” is determined by the context in which it appears, not its character as “foreign” per se.

Central to the context question, immunology must successfully integrate two, hitherto conceptually separate systems of inflammation. Virtually all attention regarding immune identity has been paid to the lymphocyte and its product, antibody. But there is an older phylogenetic system of immunity, the so-called “innate system” (as opposed to the “acquired” immunity of lymphocyte/antibody reactivity), which employs an ancient protein attack complex—complement (named originally as complementary to antibody)—and lectin proteins that together serve as opsonizing (coating) recognition proteins for phagocytes. This innate system is, in fact, the first line of defense against invading pathogens, and while it lacks the exquisite specificity of the lymphocyte system, the phagocyte with its attendant co-factors readily recognizes bacteria, some viruses, fungi, and protozoans, and also responds to non-specific damage to body tissues. The interesting issue for this discussion is that the innate system of immunity lacks the ability to distinguish self from non-self in the terms defined for lymphocyte biology, yet a second (or perhaps third) signal is required from these non-distinguishing antigen-presenting phagocytes

to activate lymphocytes. And there lies the rub. How are the two systems integrated to account for identity discrimination? The “danger” theorists maintain that these second signals must arise from such non-specifying sources so that the “self” concept essentially deconstructs, while the protectors of the self concept argue that the immune system simply needs to broaden its scope to integrate such “non-discriminatory” signals into a more discriminating system. In either case, a new theoretical consensus seems to be emerging as the “self” is either bypassed or expanded beyond its original formulation. (For review of contending theories see Anderson and Matzinger 2000b)

These developments continue a trajectory of two major theoretical developments: Originally, Metchnikoff regarded immunology as effecting dual functions: first, establishing organismal identity, and then protecting its integrity. His immunochemical contemporaries and their direct heirs followed the second agenda to the exclusion of the first. The primacy of the identity issue was re-introduced by Burnet, and his program defined immunology for the latter half of the 20th century. The second theoretical advance was made by Jerne, who moved past the identity issue altogether. No longer in service to a “self,” on his view the immune system functioned within a greater whole as a cognitive faculty, perceiving only what it might know—*itself*. Jerne thus introduced, perhaps ironically, a revision of the self metaphor, not its final elimination. For him, patterns, context, and interlocution become organizing principles, so that the self, assuming a Jernian perspective, is eclipsed by another catch-all metaphor, *cognition*, a direct descendent of the self concept, which itself readily lends to the scientific dictionary a host of meanings borrowed from other human experience (Tauber 1994; 1997; 1999). Without pursuing the ramifications of the cognitive approach to immunity, it is still evident that this turn in the language—“perception,” “memory,” “learning”—are in service to a more elusive “knowing entity.” Thus hidden within new formulations, the self still resides, reflecting a deep struggle over the character of biology, one that has its roots in Bernard's original understanding of autonomy, and now linked to our own more complex ecological views of agency and determinism.

On balance, notwithstanding the weakness of the metaphor, “self” maintains important uses despite its indistinct borders. Arguably, its elusive character is crucial to its utility and evocative power. But there is a deeper concern with the self's philosophical underpinnings, so that beyond the scientific rationale, the history of the concept of self suggests that the metaphor has specific uses not readily applied to the investigation of immune phenomena. Charles Taylor's description of “the punctual self” clarifies this issue (1989):

> John Locke attempted to construct “the self” as an autonomous legal unit to fulfill certain seventeenth-century liberal political goals. To do so he extrapolated from a philosophical invention. The “punctual” self was part of the early modern scientific conceit that regarded the knowing subject as totally divorced from the world in order to attain objectivity. The self itself also became a subject of scrutiny, so that ordinary experience might be seen from afar, objectified, and thereby controlled. He thereby reified the mind to an extraordinary degree, adopting a kind of atomism. This construction of the thinking subject supported a radical disengagement of oneself with a view toward remaking the world: “the real self is ‘extensionless;’ it is nowhere but in the power to fix things as objects” (Taylor 1989, p. 172). This power reposes in consciousness, a theme traced to Hume and later to William

James (Tauber 1994, pp. 207-15) and the phenomenologists (ibid., pp. 215-29).

Taylor argues that the self, as an object (or entity) must fulfill certain criteria: it must have objective status, standing independent of any description or interpretation, and be capturable in explicit description. Most importantly, an object can and must be understood without reference to its surroundings or contingent circumstances (Taylor 1989, pp. 34-5). The self of Locke and David Hume cannot fulfill these criteria. Taylor makes the critical point that “the self” is the answer to the question, “Who am I?”, which requires answers totally dependent on cultural or moral contexts, frameworks, or orientation—human categories of personal and social action, of value. Epistemological criteria are obviously operative, but the question of personal identity is a *moral* issue, not an epistemological one. *The self, then, is a moral description or category, one that fulfills criteria of human identification.*

Thus the “punctual” or “detached” self arose from two tributaries: the agent of a moral philosophy in post-Reformation England and the scientific actor who would scrutinize the world, and himself, apart from any constitutive concerns: The self's “only constitutive property is self-awareness. This is the self Hume set out to find and, predictably, failed to find” (Taylor 1989, p. 50). This identity over time is a construction that simply fails to fulfill the essential criteria of an entity given above. Most importantly, defining personal identity, the “Who am I?” question, can only be answered in the context of social and moral concerns. Context-determined, the self simply cannot be reduced to some single psychological construction of continuity, not only because self-consciousness cannot be captured or defined, but more fundamentally, as Hume himself realized, this was only a psychological conceit, a vague awareness of an identity function held together by psychological reflection. It was a useful invention, but it had no basis that could be defined by any analytical criteria.

The problematic status of “the self” in ascribing human agency perhaps should have alerted immunologists to the limits of its application to their science. Just as humans are loosely understood as selves, so too might scientists refer to immune identity in a similarly vulgar sense. There has been, to be sure, metaphorical utility in the term, but scientists seek to move from metaphor to more concrete and precise definitions. If theory is based on phenomena that indeed may be described more objectively, then those terms of discussion are adopted, because the scientific lexicon seeks more precise reference to natural entities and their relationships. And if metaphors become distorting to the evidence, they are abandoned. On the view presented here, immunology's cooption of the “self” was, from the very beginning, restricted by the metaphor's vague meanings, and immunology must—and, indeed, is—now moving beyond its original models to embrace new theories and novel metaphors to build its evolving theoretical edifice. In its wake, the science leaves us to ponder the significance of its failure to define the self and the cultural implications of the attempt (Haraway 1989; Martin 1994).

Death

Attempts to understand death and its ramifications have generated much controversy. In what follows we will examine six areas of debate. *First*, what constitutes a person's death? It is clear enough that people die when their lives end, but less clear what constitutes the ending of a person's life.

A *second* controversy is whether one or more of several arguments defeats the *harm thesis*, the claim that death harms the individual who dies. (Often, discussions of the harm thesis ask whether post-mortem events, as well as death, can harm the individual who dies.) These arguments are as follows: (1) The *no-self theory* rejects the very idea of a self; this is a challenge to the harm thesis, since, unless there are selves, there is nothing that death can harm. (2) According to the *comparative good objection*, saying that death is harmful would make sense only if saying that the dead are worse off than the living made sense, which it does not, because an individual who has died is nonexistent and hence does not have a level of well-being. (3) The *symmetry argument* claims that it is irrational to think death is bad for us, because we do not think the nonexistence that preceded our births is bad for us, and when we compare this period of nonexistence to death, we see the two are mirror images, alike in all respects. (4) What might be called the *timing puzzle* is an attempt to impale the harm thesis on the horns of a dilemma. If death, or some post-mortem event, harms us, it does so before we die, or afterwards. The first option seems absurd, so the harm must occur while we are dead. But a person can be harmed only if caused to be in some sort of objectionable condition, and since the dead do not exist, they are in no condition at all. Either way, the harm thesis is false.

A *third* controversy concerns attempts to show that even if the dead cannot be harmed, the harm thesis is correct, since death, and some post-mortem events, harm the living. That is, there is something in the way death affects an individual who is not yet dead that constitutes harm. Admittedly, the idea that death or a post-mortem event harms the living may appear mysterious, but only if we operate with two overly narrow conceptions. First, we may think, mistakenly, that unless one thing *A*, has a causal impact on another *B*, *A* cannot affect *B* at all. This overlooks the possibility that *A* might affect *B* by influencing what is true of *B*. This is the way people who care about how they are thought of can be affected for the worse by posthumous events that destroy their reputations: these events have no causal impact on them, but they make it true of them that their desire always to be thought well of will be thwarted. Death, also, can affect us, by making it true of us that many of our desires will be thwarted. A second overly narrow conception we might have concerns harm. Everyone acknowledges that an event is harmful if it causes the presence of a bad condition of some sort, such as a wound. But there is another kind of harm: an event is sometimes harmful because it causes the absence of a good condition of some sort. When our teacher is killed, we lose knowledge we would otherwise have gained. Some theorists argue that all harms reduce to the first sort (so that, if the loss of a teacher is harmful, that is because it leaves us in a bad -- in effect

‘wounded’ -- condition), and reject the harm thesis on the grounds that death and posthumous events cannot cause wound-type harms. Other theorists counter that both kinds of harm exist, and death can harm us in the second way, by precluding our achieving all sorts of goods, yet leaving no ‘wounds’.

Assuming that the harm thesis is correct, a *fourth* controversy arises, concerning the specific nature of the harm death and various post-mortem events do, and whether such harms constitute misfortune. Presumably, these events harm us by putting certain goods out of our reach, but we are not always harmed by states of affairs that block our access to goods. My not having a magic lamp blocks me from getting three wishes, but it would be silly to say that I am harmed by my lack of a lamp. As an approximation, we might say that an event or state of affairs harms me if it ensures that I will lack some good that, otherwise, I would have had, but this criterion is open to objections.

A *fifth* controversy concerns whether all deaths are misfortunes or only some. Of particular interest here is a dispute between Thomas Nagel, who says that death is always an evil, since continued life always makes good things accessible, and Bernard Williams, who argues that, while premature death is a misfortune, it is a good thing that we are not immortal, since we cannot continue to be who we are now and remain meaningfully attached to life forever.

A *final* controversy concerns whether or not the harmfulness of death can be reduced. It may be that, by adjusting our conception of the self, or the good life, and by altering our attitudes, we can reduce or eliminate the harm death can do to us. Indeed, the adaptation of our views and attitudes might be a way to reduce or eliminate the harmfulness of anything that might happen to us, as certain ancient theorists, such as Gautama and perhaps Epicurus suggested. But there is a case to be made that such efforts will backfire if taken to extremes.

---

1. What is Death?

The term ‘death’ is ambiguous. Undergoing a disease that undermines the ability to live is one thing, the ending of life is a second, and the condition of having life over is a third. The first of these is a process,

the second an event, while the third is a state or condition. ‘Death’ can refer to any or all of the three, and it is particularly easy to run the last two together. To avoid confusion, it helps to use the term *death* (or *dying*) for the event of life's ending, the term *being dead* for the state in which life has ended, and neither for the process of physiological decline that (unless halted) undermines life and leads to death.

‘Death’ is also unclear in at least two ways. First, the concept of life is not entirely clear, and to the extent that we are puzzled about what life entails, we will be puzzled about what is entailed by the ending of life, that is, death (Feldman 1992). Second, it seems somewhat indeterminate whether a temporary absence of life suffices for death, or whether death entails a permanent loss of life. For practical purposes, whenever a creature loses life, or becomes nonexistent, the condition is permanent; so ‘death’, as commonly used, need not be sensitive to the distinction between temporary nonexistence and permanent nonexistence. But in thought experiments we can imagine the temporary loss of life and existence. Suppose, for example, that I were frozen and later revived, as is sometimes done to simple organisms: it is tempting to say that I cease to be alive, and cease to exist, while frozen in a state of suspended animation. Or imagine a futuristic device that reduces me to disconnected atoms which it stores and later reassembles just as they were before. Many of us will say that I would survive—my life would continue—after the reassembly, but it is quite clear that I would not exist during intervals when my atoms are stacked in storage. In these cases, our linguistic intuitions give no definitive verdict concerning the applicability of ‘death’. On the one hand, it seems appropriate to say that I die when my body is completely frozen or my atoms are disconnected, since the term ‘death’ seems applicable when a creature's life ceases. On the other hand it seems correct to deny that I die, since the cessation of my existence is only temporary given that my life is eventually restored, and ‘death’ seems applicable only when a creature is made permanently nonexistent. Nonetheless, once we allow our competing intuitions to work themselves out, we are likely to conclude that permanent nonexistence more fully captures what we mean by ‘death’; hence in what follows we may as well assume that death entails permanent nonexistence.

According to some religious traditions, people need not permanently cease to exist when their bodies break down. There are perhaps two main competing ideas about how an afterlife is possible. First, our physical demise could be merely temporary, since God might resurrect our bodies (restoring our mental life in doing so). Second, we might avoid even temporary nonexistence, assuming we are immaterial (nonphysical) souls who survive the demise of the body. Proponents of the first idea of the afterlife sometimes apply ‘death’ to the breakdown of bodies, and proponents of the second sometimes apply it to the soul’s departure from the body, but both groups presumably will also acknowledge that ‘death’ would apply to our permanent nonexistence (even though they would deny that such death is inevitable).

1.1 Transition v. Ending

Does our existence come to a final end when our bodies break down, or is there some sort of transition to an afterlife? As evidence for the latter, one might cite anecdotes by gravely ill people, who sometimes report out-of-body experiences, whereby they seem to be souls traveling outside of their bodies. But these data can be accommodated by the hypothesis that death is our complete annihilation, together with the claim that out-of-body experiences are misleading. In support of this alternative, we might cite the fact that these experiences can be produced pharmacologically (Blackmore 1993), in people who are perfectly

healthy. Unless one supposes that souls are knocked loose by drugs, only to wander back once the drugs wear off, such experiments suggest that out-of-body experiences are illusory, even when triggered in the brains of dying people. Moreover, scientists have never been able to detect souls, and many of the people who claim this ability have been proven frauds. Aside from such empirical considerations, there are further arguments for an afterlife in the philosophical and religious literature. However, most philosophers are skeptical about these arguments, and we must leave these aside. Hereinafter we will adopt the conservative assumption that death is annihilation, or permanent nonexistence.

1.2 Death and Identity

Even if immaterial souls do not exist, there is good reason not to identify the deaths of people with the deaths of their bodies. For you can survive the demise of parts of your body, and your body can survive while you do not. *You* die if and only if your identity is destroyed. Hence we can clarify what it is for a person to die only if we clarify what is essential to a person's identity (Green and Winkler 1980). This is a complicated matter, which we must leave largely unexamined. But a few points are in order.

First, theorists such as Derek Parfit (1984), building on the work of John Locke (1689), have made a strong case for the view that psychological attributes such as memories and character traits, which change gradually over time, are central to our identities (see the essays in Perry 1975). Two separate but related ideas of identity vie for our acceptance: *identity as connectedness* requires that one's psychological profile not change significantly over time if one is to remain the same person, while *identity as continuity* allows changes in one's profile so long as these are gradual. According to the first idea, we can gradually lose our identities; identity is a matter of degree, since we retain our psychological attributes in varying degrees. By the second idea, identity is all or nothing; we either remain the same person or we do not; either there is not more than a gradual change in our psychological profiles or there is. Hence if we think of identity as connectedness, we will conclude that death, too, can come in degrees, and becomes complete when our psychological profiles are greatly altered or destroyed. Thinking of identity as continuity will lead us to say that death is all or nothing -- that people live through gradual, but not sudden and drastic, psychological changes.

Second, it is important to distinguish between the concept of death and a criterion for death. The concept of death says what death *is*: the cessation of personal survival. A criterion for death, by contrast, lays out a condition by which a person's death may be determined. The traditional criterion for death says that you will be dead when your heart and lungs cease to function (not that death *is* cessation of respiration and cardiac functioning). A more recent criterion is brain death -- meaning the death of the entire brain -- since the brain is the seat of our psychological features. The brain death criterion is more accurate since, with modern technology, respiration and blood circulation can be maintained artificially even when the brain is dead. As things stand, authorities in the legal and medical context frequently rely on the brain death criterion (President's Commission, 1981). For example, tissues are not to be harvested from organ donors unless the entire brain is dead. But there is good reason to consider a person dead even if certain parts of the brain are still alive. Personality is most closely associated with the higher brain (the cerebral cortex). Unsurprisingly, then, there is increasing support for a *higher* brain criterion for death, according to which death occurs when the higher brain is no longer alive.

2. How is Death Not Harmful?

Typically, those who value life accept a view that might be called *the harm thesis:* annihilation is, at least sometimes, bad for those who die, and in this sense something that 'harms' them. It is important to know what to make of this thesis, since our response itself can be harmful. This might happen as follows: suppose that we love life, and reason that since it is good, more would be better. Our thoughts then turn to death, and we decide it is bad: the better life is, we think, the better more life would be, and the worse death is. At this point, we are in danger of condemning the human condition, which embraces life and death, on the grounds that it has a tragic side, namely death. It will help some if we remind ourselves that our situation also has a good side. Indeed, our condemnation of death is here based on the assumption that more life would be good. But such consolations are not for everyone. (They are unavailable if we crave immortality on the basis of demanding standards by which the only worthwhile projects are endless in duration, for then we will condemn the condition of mere mortals as tragic through and through, and may, as Unamuno (1913) points out, end up suicidal, fearing that the only life available is not worth having.) And a favorable assessment of life may be a limited consolation, since it leaves open the possibility that, viewing the human condition as a whole, the bad cancels much of the good. In any case it is grim enough to conclude that, given the harm thesis, the human condition has a tragic side. It is no wonder that theorists over the millennia have sought to defeat the harm thesis. Let us examine their efforts.

2.1 The No-self Challenge

The first challenge to the harm thesis confronts us if we object to death on the grounds that it takes away our existence. According to Gautama (563-483 B.C.), it is a mistake to say that death ends our existence. If he is correct, our objection is moot. But why does Gautama deny that death causes our nonexistence? It is not because there is an afterlife. Instead, his thought is that there is no self and never was. The notion of a self is defective, so it makes no sense to ask whether selves are annihilated, and those who fear annihilation are confused. The no-self view, in turn, Gautama rests on skepticism about the notion of souls or substances, thought of as changeless substrata underlying changing attributes.

This first challenge to the harm thesis is far from conclusive, however, since the notion of personal identity is not tied inextricably to any particular conception of substance. As John Locke pointed out, a criterion of identity based on psychological continuity floats free of any particular conception of the underlying material basis for our psychological attributes. Presumably, our psychological attributes, and hence our identities, depend on the brain, yet survive its material transformation.

2.2 The Comparative Good Objection

Consider a second challenge to the harm thesis. The claim that we are harmed by death seems to imply that we are worse off dead than alive. But being worse off dead seems to require that we have some level of well-being *while* dead which compares badly to our level of well-being while alive. However, the dead

do not have a level of well-being since they do not exist. Apparently we are in a muddle when we claim to be harmed by death.

This objection fails, since being worse off dead than alive need not imply that we have some level of well-being while dead. Perhaps when I say I am worse off dead than alive, I compare alternative ways my life might go, noting that some alternatives would be better than others, and judge that an endless life is the best fate of all for me. Perhaps I assess events in terms of their bearing on which alternative I end up with, as follows: when an event determines that the way my life shall go is inferior to the alternative ways it might have gone, it harms me. Relying on this approach, I conclude that any event, such as death, that ends my life is bad for me in the sense that it brings about one of the inferior alternatives. What I am saying, then, is that endless life is better for me than the briefer alternatives, not that my state while living endlessly is better than my state while nonexistent. Death affects me, not by placing me in some condition or another during some mysterious form of existence, but rather by limiting the duration of my life.

2.3 The Symmetry Argument

A third challenge to the harm thesis is an attempt to show that the state death puts us in, nonexistence, is not bad. According to the *symmetry argument*, posed by Lucretius, a follower of Epicurus, we can prove this to ourselves by thinking about our state before we were born:

> Look back at time … before our birth. In this way Nature holds before our eyes the mirror of our future after death. Is this so grim, so gloomy? (Lucretius 1951)

The idea is clear to a point: it is irrational to object to death, since we do not object to pre-natal nonexistence (the state of nonexistence that preceded our births), and the two are alike in all relevant respects, so that any objection to the one would apply to the other. However, Lucretius' argument admits of more than one interpretation, depending on whether it is supposed to address the event of death or the state of death (or both).

On the first interpretation, the death *event* is not bad, since the only thing we could hold against it is the fact that it is followed by our nonexistence, yet the latter is not objectionable, even to us, as is shown by the fact that we do not object to our nonexistence before birth. So understood, the symmetry argument is weak. Our complaint about death need not be that the state of nonexistence is ghastly. Instead, our complaint might be that death brings life, which is a good thing, to an end, and, all things being equal, what ends good things is bad. Notice that the mirror image of death is birth (or, more precisely, becoming existent), and the two affect us in very different ways: birth makes life possible; it starts a good thing going. Death makes life impossible; it brings a good thing to a close.

Perhaps Lucretius only meant to argue that the death *state* is not bad, since the only thing we could hold against the death state is that it is nonexistence, which is not really objectionable, as witness our attitude about pre-natal nonexistence. So interpreted, there is a kernel of truth in Lucretius' argument. Truly, our pre-natal nonexistence does not concern us much. But that is because pre-natal nonexistence is followed

by existence. Nor would we worry overly about post-natal nonexistence if it, too, were followed by existence. If we could move in and out of existence, say with the help of futuristic machines that could dismantle us, then rebuild us, molecule by molecule, after a period of nonexistence, we would not be overly upset about the intervening gaps, and, rather like hibernating bears, we might enjoy taking occasional breaks from life while the world gets more interesting. But undergoing temporary nonexistence is not the same as undergoing permanent nonexistence. Unlike the former, the latter entails *death* in the fullest sense. What is upsetting is the death that precedes post-natal nonexistence -- or, what comes to the same thing, the permanence of post-natal nonexistence -- not nonexistence per se.

There is another way to use considerations of symmetry to argue against the harm thesis: we want to die later, or not at all, because it is a way of extending life, but this attitude is irrational, Lucretius might say, since we do not want to be born earlier (we do not want to have always existed), which is also a way to extend life. As this argument suggests, we are more concerned about the indefinite *continuation* of our lives than about their indefinite *extension*. (Be careful when you rub the magic lamp: if you wish that your life be extended, the genie might make you older!) A life can be extended by adding to its future *or* to its past. Some of us might welcome the prospect of having lived a life stretching indefinitely into the past, given fortuitous circumstances. But we would prefer a life stretching indefinitely into the future.

Is it irrational to want future life more than past life? No; it is not surprising to find ourselves with no desire to extend life into the past, since the structure of the world permits life extension only into the future, and that is good enough. But what if life extension were possible in either direction? Would we still be indifferent about a lengthier past? And should our attitude about future life match our attitude about past life?

There should be a match if our interests and attitudes are limited in certain ways. If quantity of life is the only concern, a preference for future life is irrational. Similarly, the preference is irrational if our only concern is to maximize how much pleasure we experience over the course of our lives without regard to its temporal distribution. But our attitude is not that of the life- or pleasure-gourmand.

According to Parfit, we have a far-reaching bias extending to goods in general: we prefer that any good things, not just pleasures, be in our future, and that bad things, if they happen at all, be in our past. He argues that if we take this extensive bias for granted, we can explain why it is rational to deplore death more than we do our not having always existed: the former, not the latter, deprives us of good things in the future (he need not say that it is because it is in the past that we worry about the life-limiting event at the beginning of our lives less than the life-limiting event at the end). This preference for future goods is unfortunate, however, according to Parfit. If cultivated, the temporal insensitivity of the life- or pleasure-gourmand could lower our sensitivity to death: towards the end of life, we would find it unsettling that our supply of pleasures cannot be increased in the future, but we would be comforted by the pleasures we have accumulated.

Whether or not we have the extensive bias described by Parfit, it is true that the accumulation of life and pleasure, and the passive contemplation thereof, are not our only interests. We also have active, forward-looking goals and concerns. Engaging in such pursuits has its own value; for many of us, these pursuits,

and not passive interests, are central to our identities. However, we cannot make and pursue plans for our past. We must project our plans (our self-realization) into the future, which explains our forward bias. It is not irrational to prefer that our lives be extended into the future rather than the past, if for no other reason than this: only the former makes forward-looking pursuits possible. It is not irrational to prefer not to be at the end of our lives, unable to shape them further, and limited to reminiscing about days gone by.

Nevertheless, it does not follow that we should be *indifferent* about the extent of our pasts. Being in the grip of forward-looking pursuits is important, but these take time, and their historical development, which underlies our self-realization, is important, too. We have passive interests as well, which would prompt us to extend our pasts if the opportunity presented itself. If fated to die tomorrow, most of us would prefer to have a thousand years of glory behind us rather than fifty years of glory.

2.4 The Timing Puzzle: Death Cannot Affect Us

Another challenge arises when we look for the specific time during which we undergo the harm that death supposedly brings upon us. As Epicurus (341-270) says in his *Letter to Menoeceus*, there does not appear to be such a time:

> Death …, the most awful of evils, is nothing to us, seeing that, when we are, death is not come, and, when death is come, we are not.

His thought is that if death is bad for us, there must be a time when we are made worse off. Given that death follows immediately upon life, the harm must be incurred either while we are alive, or afterwards. Presumably it is not incurred while we are alive, since that implies that we undergo the harm before the death responsible for it occurs. But the alternative is to say that the harm is incurred after we are gone. Yet it is odd to say that nonexistent people can be harmed, for wouldn't that mean people have some sort of ghostly existence after their lives end, and that the condition of these ghosts can be worsened?

Epicurus focuses on death, but if his argument is good, it applies more generally, to include all events that follow death. Let us call something a *mortem event* if it takes place when we die or afterwards, so that death and every event that follows is a mortem event. Epicurus's position is that no mortem event can harm us.

Epicurus's argument can be interpreted in more than one way. The intent might be to show that no mortem event can *affect* us *at all*. This claim, together with the following *impact thesis*, implies that mortem events are harmless:

> An event harms us only if it somehow affects us at some time (the event may affect us well after it occurs).

Let us see if it is possible to show that mortem events do not affect us. Then we can try out a weaker thesis: that no mortem event can affect us *in a way that matters*. This weaker claim is easier to defend; in

all likelihood, it is what Epicurus had in mind, but the stronger claim is worth exploring.

To defend the view that mortem events do not affect us, we need to make some assumptions about when an event can affect us. To this end, let us adopt the *causal account of responsibility*:

a. An event (or state of affairs) can affect some subject (person or thing) *S* only by causally affecting *S* (the *causal impact only* thesis).
b. A subject *S* cannot be causally affected by an event while *S* is nonexistent (the *exist while affected* thesis).
c. A subject cannot be causally affected by an event before the event occurs (the *ban on backwards causation*).

From this account, it follows that a *post*-mortem event, such as the burning of one's corpse, cannot affect us after we are dead, since, by (a), to be affected is to be affected causally, but, by (b), nonexistent people cannot be causally affected by any event. It also follows that a post-mortem event cannot affect us while we are alive, given the ban on backwards causation. We might call this the *inertness of posthumous events* argument:

1. An event can affect us only by causally affecting us (the causal impact only thesis).
2. We cannot be causally affected by an event while we are nonexistent (the exist while affected thesis).
3. The dead do not exist.
4. So no posthumous event can affect us while we are dead.
5. We cannot be causally affected by an event before the event occurs (the ban on backwards causation).
6. So no posthumous event can affect us while we are alive.
7. So no posthumous event can affect us.

So far so good: no post-mortem event can affect us. However, there may still be a *mortem* event that can affect us: death. Of course, the thesis that we must exist to be affected rules out the possibility that death affects us *after* it occurs (after we are nonexistent). But it does not rule out the possibility that death affects us exactly *when* it occurs. Or does it?

Well, it does if death occurs only after we are nonexistent, as do post-mortem events. And some theorists have maintained that the event of death occurs on the nonexistence side of the boundary between our existence and nonexistence. For example, Feinberg (1984, p. 172) adopts this view in the following passage:

> Death is defined simply as the first moment of the subject's nonexistence, so it is not something that ever coexists with the dying person for the time required for it to have a directly harmful effect on him.

However, the idea that we die only after we are nonexistent is unacceptable, for the event of death is a transition from a state of life to a state of death, and it is absurd to say that the transition takes place only after we are gone. It is also absurd to say the transition is completed while we are still alive. Hence defining death as the first moment of our nonexistence, as Feinberg does, is no better than defining it as the last moment of our existence.

But is it reasonable to say that we are alive at least part of the time during which we undergo the transition from life to death? Yes, since death takes time, and we are fully alive when the transition of death begins, partially alive as it progresses, and not at all alive when it ends. We exist while it is under way, and are affected by it in a straightforward way: it makes us less and less alive, until finally we cease to be.

However, conceivably a death might be instantaneous, in the following way: we simply move from being wholly alive to being wholly dead, and no time passes between the two. Can *that* kind of transition affect us? Actually, it is hard to say, since this picture is puzzling in certain ways. For example, if we suppose that no time passes in between our existing and our not existing, it seems to follow that everything that happens occurs either while we exist or while we do not exist (or during a period of time combining the two). We are never in between, never in any condition in between (whether existence, nonexistence, or some mysterious state that is neither), and no events happen in between. So if death is an event, when does it occur? If death is both an event and a transition across the boundary between being wholly alive and wholly dead, don't we have to imagine it overlapping with the sequences of events on both sides of this boundary? But suppose that, in spite of such puzzles, we can make it clear that the causal effects of an instantaneous death occur entirely on the far side of the boundary between existence and nonexistence. Then according to the causal account of responsibility, instant death does not causally affect us when it occurs or at any time thereafter.

Let's review. Granting them some leeway, especially the assumption that only what has a causal impact on us affects us, Epicurians can show that no mortem event other than death can affect us, and that if death can affect us, it can do so only precisely at the time it occurs. But they lack a convincing argument against the possibility that death and some of its effects overlap in time; and hence they cannot prove that mortem events are harmless.

2.5 The Timing Puzzle Again: Death's Impact Is Harmless

Instead of trying to show that no mortem event can affect us at all, Epicureans can try to show that no mortem event can affect us *in a way that should matter to us.* To that end, they can assume that something can affect us in a way that is positive, negative or even neutral from the standpoint of value, only if it causes (or can cause) in us the presence of some salient condition. The new strategy calls for replacing the impact thesis with the *bad impact thesis*:

> An event harms us only if it is responsible for a bad condition's coming to be present in us at some time (the event and the condition's presence in us need not be simultaneous).

Some terminology will be helpful. If an event *E* is responsible for our being in a bad state, let us say that *E* is the *indirect* harm, while the bad state that *E* precipitates is the *direct* harm. Thus *E* indirectly harms us when it occurs, but directly harms us only when the bad state is brought about.

Proponents of the new thesis are committed to the old, but not vice versa. Something cannot affect us in a bad way unless it somehow affects us, but not all ways of affecting us involve the presence in us of some salient condition. Death affects us when it annihilates us, but it is not responsible for any condition's presence in us. For no condition can be present *in* us if there is no *us.* A condition cannot be present in us unless we exist. We can be directly harmed only if we exist--this claim is often called the *existence condition.* Yet we need not exist in order to be indirectly harmed: an event may indirectly harm us long before it has any direct impact on us; indirect harm may come even before we exist, as when someone times a bomb to go off 150 years later, killing everyone around.

Given the bad impact thesis, Epicureans can show that no mortem event can harm us by showing that no mortem event is responsible for any condition's presence in us. We might call this the *absent conditions argument*:

1. Death is responsible for our nonexistence and for the absence of conditions in us at the time it occurs and thereafter, but not for the presence of any conditions in us at any time.
2. Direct harms reduce to the presence of salient conditions in us, not in their absence (the bad impact thesis)
3. So death cannot harm us.

The point can be extended to post-mortem events: given the ban on reverse causation, and the thesis that we are unaffected while not existing, nothing that happens after we die can be responsible for any condition's being present in us at any time, so posthumous events are harmless.

Different Epicureans offer different accounts of the salient condition genuine harm reduces to. However, they seem to agree that direct harm is a kind of experience, and they offer versions of the *experience requirement*, which says that an event can harm us only if we experience it (or only if we can experience it, or only if we (can) experience it as bad). According to Epicurus's own view, the only things that are bad for an individual are things that cause that individual to suffer (this claim is the *painfulness criterion for harm*). Armed with this criterion, he offers the *argument from painlessness*:

1. The immediate result of death is the nonexistence of the self.
2. So dying is painless.
3. Nothing harms me unless it makes me suffer (the painfulness criterion for harm).
4. So dying cannot harm me.

The same goes for post-mortem events: I cannot suffer posthumously, so nothing that happens after I die harms me.

Epicurus goes on to warn against three confusions that might blind us to the force of his view. First, it is easy to confuse death with the dying process leading up to it, such as progressive cancer, and to hold our complaints about the one against the other. But Epicurus admits that the latter can be painful and hence bad for us. Is he then trying to remove our concern about death only to leave in place our concern about the dying process? That would be odd, just as it would be odd to remove objections to the state of death, while leaving intact our objections to the event of death (but see Rosenbaum 1986). The stated goal of Epicureanism is *ataraxia*, or tranquility of mind; this goal is thought to be attainable because, for the enlightened, nothing in life is harmful. From this perspective, it would not be useful to show that being dead is of no concern, while leaving us terrified at the prospect of death, or the dying process. Of the three -- death, being dead, and the dying process -- Epicurus admits only that the dying process can be bad, and even *it* is not *especially* bad. But this last Epicurus rests on the dubious claim that serious afflictions are not very painful:

> Continuous pain does not last long in the flesh; on the contrary, pain, if extreme, is present a very short time…. Illnesses of long duration even permit of an excess of pleasure over pain in the flesh (*Principal Doctrines*, Doctrine 4)

A second confused response results if we fail to distinguish pain caused by anticipating death with pain caused by death itself, and hold the former against the latter. *Anticipating* death upsets us and is, to that extent, a bad thing. However, our (present) anticipatory fear is not caused by our (future) death, since future events are powerless to affect the past. Moreover, fear is irrational unless its object is genuinely evil in some way, which death is not.

The third confusion arises if we do not distinguish what is bad for us from what is bad for others. At most, the fact that your family grieves your death supports the claim that your demise harms *them*, not that it harms you. (Too, your distress at anticipating your family's grief over your death is not grounds for you to regard your death as a bad thing: the suffering your death brings them cannot affect you, and your anticipatory grief is irrational.) Furthermore, their grief should be mitigated by the fact that your death is not bad for *you*. Their grief is entirely self-centered, exactly like the self-pity a gardener might feel at the loss of a familiar plot of land or pleasant flower.

(Would it be morally wrong to kill you, given Epicurus's painfulness criterion? Perhaps, but the moral case against killing is weak, given the fact that killing you harms you in no way, and, as a true Epicurean, you do not mind. But won't killing you displease others? Perhaps, but this reservation will not block the killing of pariahs -- or the complete annihilation of humanity.)

In sum, the Epicurean position comes to this: While one mortem event alone -- death -- can causally affect us (by annihilating us), no mortem event can harm us, since it can never cause in us the presence of any condition, and hence it can never cause in us a condition, such as the experience of pain, that qualifies as direct harm.

3. How Is Death Harmful?

Epicureans must be granted this much: all other things being equal, painless things, in being less frightening, are not as bad as painful things. If the immediate result of death is our nonexistence, and death happens too quickly to be experienced (which is far from obvious), then at least we can say that death and post-mortem events are painless, which makes them less frightening. However, even if we fear mortem events less, or not at all, since they are not experienced, should we conclude that they are not harmful? Let us see if the Epicureans' case holds up. As we shall see, even if we cannot be directly harmed while we are dead, it is possible to defend the harm thesis. We can start by looking for counterexamples to the bad impact thesis.

3.1 Harms that Wound Versus Harms that Deprive

One set of examples centers on the fact that most of us regret the severing of our interpersonal relationships and the thwarting of our aspirations. However, it is possible for these to be destroyed without our noticing. Suppose (Nozick 1971) that by means of an elaborate lie, an enemy convinces someone you love to hate you but to feign love so as to keep tabs on you for the rest of your life. Then you lose the love of your partner yet forever retain the appearance of love. Your loss produces no troubling experiences in you, but it is bad for you nonetheless. Or suppose (Nagel 1979) you are struck by an illness that instantly destroys your faculties and reduces you to the state of a contented infant. Here again is a tragic loss that is not accompanied by troubling experiences. A related case: it is bad to be raped after secretly being drugged into sleep, even though we cannot experience being raped while asleep. A second set of examples exploits the fact that we can experience, and suffer from, nothing that happens after we die, yet many post-mortem events are regrettable. For example, it is terrible to have your will set aside. And there are other examples. Suppose you found out that, starting in two weeks, your family and friends (or everyone in the world, for that matter) were to suffer horribly. But then you learn you are to die in one week, so their fate can have no causal impact on you. If you adopt the Epicurean's bad impact thesis, the fate of your loved ones, under such circumstances, is not cause for concern, and if you could do something now to prevent their suffering, it would be unimportant for you to do so. Most of us would be appalled by the Epicurean's indifference about all of these matters.

Epicureans are committed to denying that any of these examples involve genuine harm, given their view that (direct) harm consists in the *presence* of some condition that is bad for us, such as wounds or pain. Their view, which we might call the *present bad view of harm* or the *wound model of harm*, is that events are harmless -- unable to make us worse off -- unless they leave us in a condition analogous to being wounded. Our examples suggest that this is an overly narrow conception of harm. They suggest that the direct harmfulness of some events may consist in the *absence* of a salient *good*, such as the love of your partner, or the completion of your life's work, or the flourishing of your children. In fact, the salient good might be pleasure itself, so even hedonists can agree that the direct harmfulness of an event might consist in the absence of a good. Epicurus's own hedonist account is negative, in the sense that it restricts harm to the presence of pain; but nothing stops a hedonist from adopting a positive account, according to which an event may harm us by depriving us of pleasure. The idea that direct harms can consist in the absence of some salient good (but might also consist in the presence of a relevant bad condition) we might term the *absent good view of harm*, or the *deprivation account of harm*.

But if the absence of a salient good can constitute a harm, then death can be harmful, for there are two ways in which death can be responsible for harmfully absent goods. First, it destroys goods, such as good conditions present in us when we die (these are *destruction harms*). Second, it precludes our retaining goods or acquiring goods (*preclusion harms*). So the harm thesis is true after all.

However, proponents of the harm thesis still have work to do, for so far nothing they have said tells us *when* we incur the harms associated with absent goods. Now, it seems possible to pin down the time we incur the harms associated with death. Perhaps destruction harms and the death responsible for them occur simultaneously. And perhaps all preclusion harms associated with death can be treated similarly. However, the harm done by post-mortem events resists this treatment: it seems unfortunate if the executor of your will ignores your directives, but when are you made worse off? If we say you are harmed at the time your will is ignored, rather than before, we have to say that you can be made worse off after you are gone. It is as if, before and after you die, you persist in a harm-free condition until your evil relatives toss out your will, at which point you are placed in a state of being harmed, made all the more mysterious by the fact that you are long gone. That seems mistaken. But what are the alternatives? Perhaps, as Thomas Nagel suggests (1979), it is an indeterminate matter when some things, such as the violations of wills, or death, make us worse off, although they do so all the same.

Apparently, the absent good view of harm allows us to explain the harmfulness of death, but leaves us with questions about when posthumous events harm us. Should the air of mystery surrounding post-mortem harms prompt us to deny that they exist? That is one alternative open to the proponents of the harm thesis: They can give up on post-mortem harms and defend the harm thesis on the grounds that death is responsible for temporally locatable deprivation harms. They will have rejected only one of the three main pillars supporting the Epicureans' case against the harm thesis, namely the present bad view of harm. The remaining two pillars are the causal account of responsibility, and the assumption that the dead are in no sense real.

There are other alternatives. Each involves rejecting not just the present bad view of harm, but also one additional pillar of the Epicureans' argument. An option we shall call the *harmed dead view* rejects the assumption that the dead are not real. A further option, which we shall call the *noncausal harm view*, rejects the causal account of responsibility.

3.2 The Harmed Dead View

Suppose that in some sense people are real even after death annihilates them. This assumption may allow us to revive the possibility that post-mortem events can harm us *while* we are dead. But are annihilated people real in any sense? Perhaps; Silverstein (1980) argues that we can say that they exist in a timeless sense of existence, and Palle Yourgrau suggests that we speak of the dead, as well as the unborn, as objects, where an object has a kind of reality even if it does not exist. Doing so, Yourgrau thinks, allows us to say that “the deprivation of nonexistence endured by the unborn is as great as that suffered by the dead… ” (Yourgrau 1987, p. 149).

However, even if we can show that the dead are real in some sense, we will not be in a position to claim that the dead can be harmed unless we abandon the present bad view of harm. Absences are the only candidates for harm to people while they are nonexistent, for even if the dead are in some sense real, it is difficult to imagine a condition whose presence in them constitutes a state of harm. Being deprived of existence, as the unborn are, is itself at worst a harmful absence, and hence, by the bad impact thesis, no harm at all. We must also reject the experience requirement, which says that an event can harm us only if we experience it, for obviously the dead feel no pain. And if well-being is marked out in terms of the presence of some salient condition, it is difficult to see that the mode of reality possessed by the dead permit them to have a level of well-being. Hence if being harmed requires having a level of well-being, the dead cannot be harmed.

But if we do admit that goods deprivations can constitute harm, there is no further need to decide whether the dead can be harmed. As we shall see, we can defend the harm thesis on the basis of the deprivation account of harm together with other assumptions that hold even if the dead cannot be harmed.

3.3 The Noncausal Harm View

Undeniably, an air of mystery surrounds the idea that people who are annihilated come to be in a state of harm while dead. It would be desirable to pin down when post-mortem events harm us without assuming anything about the ontological status of the dead. Fortunately, there is a way. But we will have to reject one tenet of the causal account of responsibility, namely, the causal impact only thesis. Given the ban on backwards causation, the causal impact only thesis forces us to dismiss the idea that harm can occur *before* the event that precipitates it takes place. Yet, as George Pitcher (1984) says, this is precisely the idea we need in order to understand the harmfulness of a post-mortem event such as our will's being ignored. It is while you have a will, and the desires it expresses, that you are harmed. Pitcher's idea is that causation is not the only route via which things affect and thus harm others. The proposition, ‘You have a will which will be ignored’ is true now, even though it is true, in part, because of events that will occur after you and your desires cease to exist. These distant events harm you only *indirectly*. What *directly* harms you is *your having desires or interests that will be thwarted*, or *your having the potential to attain a certain good that will go unrealized*, which becomes true of you when you develop the desires or potential, and ceases to be true of you when they are gone. Perhaps (as the ban on backwards causation and the exist while affected thesis imply) we cannot be causally affected by events that will happen well after we are gone, yet we can be affected by these events in a straightforward non-causal way, because they help determine what is true of us now. It is not the dead who are harmed, but rather the living.

The idea of *non-causal* harm can be applied to death as well as post-mortem events. The verdict about death is that death can harm us *indirectly*, by being partly responsible for our having desires that will be thwarted, or potential that will go unrealized, in which case we are harmed *directly*, during such time as we have desires or potential that death prevents our attaining. Does this verdict force us to reassess our earlier suggestion that death directly harms us when it occurs? Not necessarily. For death (unlike posthumous events) might directly harm us twice: when it occurs and obliterates us, and when, because of death, it is true of us that we will not realize our potential.

There is another way to extend Pitcher's idea. We might object to the *state* of death because of its non-causal impact on us, since coming to be dead makes it true of us that we have desires that will be ignored. But instead of saying that being dead is objectionable, it seems better to say something else, once we notice that the state of death is simply the state of nonexistence initiated by the event of death. Perhaps being dead is powerless to harm us since any harm that might be associated with it is entailed in, and brought about by, death itself, which is responsible for limiting the duration of our lives, and all that that entails.

In sum, if we reject the present bad view of harm in favor of the absent good view, we can say that death is responsible for destruction harms and indirect preclusion harms at the moment it occurs, and for direct preclusion harms while we have the potential to acquire salient goods. We can also say that post-mortem events are responsible for direct and indirect preclusion harms.

4. What Is a Misfortune?

As we have seen, proponents of the harm thesis are committed to condemning a thing as bad when it deprives us of goods. Stated in this rough way, the *good-deprivation criterion* has considerable plausibility. Nonetheless, it requires development, and those who wish to refine it further will face three issues: First, should we adopt a subjectivist or an objectivist account of the good? Second, which of those goods an event or state of affairs precludes contributes to the harmfulness of that event? Third, how is harm related to misfortune?

4.1 Objective Versus Subjective

In clarifying what is good for a person, should our account be objectivist or subjectivist or some sort of mixture of the two? Nagel's well-known version of the good-deprivation criterion is objectivist. By contrast, subjectivists might say that things are good for us to the extent that they satisfy relevant desires (which desires these are must then be specified). Such theorists are likely to accept the *thwarted desire criterion* for misfortune, according to which something is bad for us insofar as it prevents us from satisfying relevant desires. To *satisfy* a desire here means to attain its object, not to gain pleasure from attaining its object, and to *thwart* a desire here means to block the attainment of its object, not to produce a feeling of frustration by such blocking. Bernard Williams is among those who defend this criterion. It was prefigured in the views of ancient Indian theorists -- for example, in Gautama's view that the cause of suffering is thwarted desire.

4.2 Harmfully Precluded Goods

The second question facing proponents of the good-deprivation view is: Which of those goods an event or state of affairs precludes (which of those desires an event thwarts) contributes to the harmfulness of that event? Not all of the goods an event puts out of reach would be attained or even accessible if the event did not occur. Losing my arms precludes my becoming a baseball star; yet, it would be odd to hold my failure

to attain stardom against my injury since I would not have attained stardom uninjured. So apparently the relevant goods are limited to those we would have enjoyed had the event not occurred. And this is Nagel's strategy (refined by McMahan 1988 and Feldman 1991): he wants to measure the harmfulness of mortality in terms of goods immortality brings us. The position is that an event or state of affairs *E* is harmful to me if and only if I would be worse off if *E* held than I would be had *E* not held, and that the degree of harmfulness of *E* is measured in terms of how much worse off I would be if *E* held than I would be had *E* not held. Given this counterfactual criterion for harm, a good *G* is relevant to whether an event or state of affairs *E* is harmful to me if and only if:

1. If *E* held I would lack *G*, and
2. If *E* had not held, I would have had *G*.

Accordingly, the loss of my arms is harmful, since I am worse off without them, which means that there is a good, such as my capacity to use tools, that meets (1) and (2). But my becoming a baseball star is not relevant to the harmfulness of the loss of arms, since it is disqualified by (2): even if I kept my arms, I would not become a baseball star.

Unfortunately, there is a problem with the counterfactual criterion. It works well when we evaluate *losses*, such as the loss of my arms. But it often fails when we evaluate *lacks*. Consider, for example, *my lack of genius*: does it harm me? It does preclude my enjoying goods great intelligence would make possible, such as the ability to discover profound truths about the universe. So it meets (1). It meets (2) as well: if I failed to lack genius -- that is, if I were a genius -- I would enjoy the goods genius brings. However, it is peculiar to say that I am harmed by my lack of genius. Why is this?

4.3 Misfortune Versus Harm

The explanation we need involves clarifying the relationship between harm and misfortune. Let us begin with some observations: it is no misfortune for me not to enjoy the goods genius would bring me, and it is no *misfortune* to be deprived of goods when their absence is not a misfortune for me. Also, lacking genius is not in itself a misfortune, and yet genius is a great good. Similar points can be made about extraordinary beauty or God-like powers of various sorts: while these are great gifts, lacking them is no misfortune. (This is not to deny that beauty could come to be important to a person who makes it the focus of life, so that losing it would be a misfortune, even if never having it would not have been.) So it need not be a misfortune to lack great goods. And it is false that, the greater the good, the greater the misfortune we suffer in being denied it.

Nagel may be making a similar point when he writes, “the question is whether we can regard as a misfortune any limitation, like mortality, that is normal to the species” (Fischer 1993, p. 68). It is not clear what Nagel is saying, because limitations that are typical to a species might be ruled out as misfortunes on the grounds that lacking them is not really humanly good. Following Aristotle, we could define what is humanly good in terms of what enables an exemplary yet actual human being to live as well as possible. Lacking the limitations of the exemplary human being, we might add, is not humanly good, and having

them is not a misfortune. Great beauty, Aristotle would say, is humanly good, but superhuman strength, of which even the best of us is incapable, is not. However, this is not the view we have defended. Our point is that a feature could be a genuine good for a human being, yet lacking it might be no misfortune.

How can lacking a great good fail to be a misfortune? Because some goods are less important for us than others, and it is a misfortune to be deprived of a good if and only if it is important for us to have it. But when is it important for us to have a good? The answer lies in the fact that it is one thing for a life to be (merely) good, and quite another for it to be the best (physically? conceptually?) possible life; some qualities are requisite for a merely good life, or a life that meets the minimal conditions for happiness, while others are essential to the optimal life, or one that provides for a degree of happiness that cannot be exceeded. Failing to have (something essential to) a good life (or minimal happiness) is a misfortune, yet failing to have (what makes for) the best possible life (or maximal happiness) surely is not. So it is plausible to say that the goods it is important to have, and whose absence constitutes a misfortune, are *essential goods*: items essential to a (merely) good life, or a life of (mere) happiness. (Of course, given the flexibility of the term 'misfortune,' some hedging is in order. Perhaps things need not go so far as to deprive us of an essential good to be a misfortune; perhaps it is enough that they significantly impair our chances of attaining the essentials.)

The explanation of why it is awkward to speak of harm when certain good possibilities, such as enjoying God-like powers, are not actualized, is that we tend to use the term 'harm' to refer to misfortune, and often it is *not* a misfortune for us when good possibilities fail to be actualized (since the failure does not bear on our having essential goods). The awkwardness is exacerbated, however, because we also want to use the term 'harm' to refer to things that are bad for us, and 'bad' covers a lot of territory: When, on the whole, something makes us worse off in any way or to any degree, no matter how trivial, it is common to call it a bad thing; we also say, of a good state of affairs that does not actually hold, that its failure to hold is a bad thing, since we would be better off if it did. Our use of the terms 'bad', 'harm,' and 'misfortune' thus makes it difficult for us to express the fact that the nonactualization of a good possibility might be no *misfortune*, even though it is *harmful* since *bad*, and *bad* only in the sense that we would be better off if the possibility were actual.

We have a choice to make. We may apply the terms 'harm' and 'bad' to any overall worsening of our condition, or to any failure to make our overall condition better. If we do, however, we cannot say that all harms are misfortunes.

5. When Is Death a Misfortune?

What is the upshot for death? Clearly some deaths deprive people of essential goods, and are therefore misfortunes. But are all deaths misfortunes?

5.1 Premature Death Is a Misfortune

By applying the thwarted desire criterion, we can reinforce the conclusion that death is not always a

misfortune. Perhaps it is not bad to die at an advanced enough age, for people who live long enough may be ground down by life until they give up many of their goals. Also, they will have attained many of their aspirations. If already satisfied, or given up, a desire cannot be thwarted, even by death, so as we lose our motivation for living, death ceases to be objectionable to us. Perhaps death is bad for us only if premature in the sense that it comes when we are still in the grip of desires that propel us forward in life, and only if satisfying our desires is a real prospect.

We are left to wonder whether death would ever cease to be objectionable were we *not* ravaged by bad health and other setbacks. Williams argues that it would be bad to live forever, even under the best of circumstances. His view is based on an assumption about the relationship between our identities and the desires that motivate us to live.

Consider a woman who wants to die. She might still take the view that if she is to live on, then she should be well fed and clothed. She wants food and clothing on condition she remain alive. In this sense her desires are *conditional*, and do not give her reason to live. Contrast a father who is committed to rearing a beloved daughter: he desires unconditionally that the child do well, and his desire gives him reason to live, because he can rear his child only if he survives. In this sense, his desire is categorical, or unconditional. Williams thinks that categorical desires are essential to identity, and give meaning to life. Through categorical desires, we are attached to projects or relationships that are definitive of the self; faced with their destruction, we would feel our lives are meaningless, and that in an important sense we cannot survive as the persons we once were.

The bearing on death, according to Williams, is, first, that people have good reason to condemn a death that is premature in the sense that it thwarts their categorical desires. Second, mortality is good, since people who live long enough eventually will lose the categorical desires with which they identify. Life will lose its novelty, and oppressive boredom will set in. To avoid ennui, superseniors would have to replace their fundamental desires, again and again. But this is to abandon their identities; it is tantamount to death.

As Williams says, lives of unimaginative routine will eventually grow stale if extended long enough. Of course, this is not supposed to comfort ordinary mortals, most of whom will die long before routine undermines the joy in living. However, as several theorists, including Nagel (1986, p. 224, n. 3) Glover (1977, p. 57), and Fischer (1993, p. 11) have suggested, it is not obvious that life must become dull. Williams may have overlooked how rich and complex life can be, especially for superseniors who pursue multiple open-ended projects in the company of other superseniors. His response to this kind of criticism is that even rich and open-ended projects eventually will become routine (say after a few billion years), so our pursuits must be replaced periodically if we are to remain interested in life. But to phase in wholly new projects is to lose our identity.

Williams's response faces objections. First, we might avoid boredom by adding to our pursuits, and varying the way we approach them, without abandoning certain core interests that define us. Second, Williams is working with a view of identity that may be too narrow. Many of us would welcome a possibility that he downplays: gradually transforming our interests and projects over time. Transformation

is not death. It is distinct from, and preferable to, annihilation. Transformation would be death only if identity were wholly a matter of connectedness. However, we also think of identity as continuity: If we could live endlessly, the stages of our lives would display reduced connectedness, yet they would be continuous, which is a property that is important in the kind of survival most of us prize. Even after drinking at the fountain of eternal youth, we would tend to focus on relatively short stretches of our indefinitely extensive lives, and over these periods we would prize connectedness, since we are animated by specific projects and relationships that can be developed only if there are strong interconnections among the temporal stages of our lives. However, sometimes we would turn our attention to relatively long stretches of life, and then, prizing continuity, we would phase in new and worthwhile undertakings that build upon, and do not wholly replace, the old.

6. Can Death's Harmfulness be Reduced?

We have been asking after the objectively correct answer to the question, Is it bad to die? Instead of treating the value of death as a fact to be discovered, some argue that death *need* not be a misfortune, if we prepare ourselves suitably. Assuming that identity is malleable, we might identify with something durable, such as a family line or the community or the natural order, so that ‘we’ survive, and need not be harmed by, the demise of the individual (of course, the demise of the family or community or natural order would still harm us). Or, like Gautama, we might altogether abandon the notion of the self, in an attempt to convince ourselves that there is no one to die. Another approach does not specifically involve adjusting the boundaries of the self. Ancient philosophers in both the East and West noticed that if we adopt the right conception of the good life, and the right desires, we prevent death from harming us. We can even become invulnerable in an important sense: nothing that happens to us will be able to diminish the goodness of our lives; nothing will be a misfortune for us, including death. Let us see how this idea can be developed.

For invulnerability, what is needed is a view given which the things that affect the goodness of our lives are entirely in our control. To arrive at such a view, we equate goodness with our happiness (or well-being), then construe happiness negatively and in such a way that it demands nothing that is out of our control.

6.1 Two Negative Accounts of Happiness

Epicurus's brand of hedonism is quite suitable in this regard, and it is likely that its proponents consider negative, or pain avoiding, hedonism more attractive than the alternatives, including positive, or pleasure seeking hedonism, due to the superior way it facilitates the goal of invulnerability. Epicurus characterizes happiness as (a) subjective, (b) agent-relative, and (c) largely negative, in that it is understood in terms of what is absent (pain), rather than what is present. These three features help shield our happiness from aspects of the world that are not in our control and that can deprive us of any positive form of happiness, such as death and the suffering of others.

Rather than reducing it to the absence of suffering, we might instead equate happiness with the (again

negative) condition of lacking thwarted desires (contrast the positive condition of having satisfied desires). These two ways of construing happiness are distinct yet closely related: Distinct since not all pain is due to thwarted desire (mashing one's thumb hurts no matter what we want), and not all desire thwartings are painful or even noticed (recall the example of the ignored will). But they are closely related since, as Gautama (and much later Epicurus) noted, the chief cause of suffering is thwarted desire: usually, we suffer from an event only when we wanted it not to happen.

6.2 Becoming Invulnerable Through Desire Adaptation

To convince ourselves that death cannot harm us, either of two strategies will serve (Luper 1987, 1996). First, we could adopt Epicurus's negative hedonism, and adjust our attitudes accordingly. Second, we could adopt the no-thwarted desires view of happiness, then *thanatize* our desires, in this sense: abandon all desires that death might thwart . Epicurus does not distinguish between the two approaches, yet they differ. Negative hedonism does encourage us to pare back our desires, but only so as to avoid the painful experiences associated with their being frustrated or to avoid other painful consequences of having them. In particular, it allows us to retain a desire so long as we cannot experience the events by which it might be thwarted, and so long as retaining it is not painful for other reasons. It does not prompt us to drop a desire simply because death might thwart it, since death thwarts desires in ways we cannot experience. Suffering is caused neither by death nor by the thwarting of any desires for which death is responsible. Thanatizing, by contrast, eliminates desires death might thwart. However, it allows us to retain some desires that are discouraged by negative hedonism. Consider, for example, my desire that the moon orbit the earth after I am dead: whether this desire is satisfied is not affected by my being alive or by anything I might do while alive. In this sense it is *independent*. Thanatizing leaves independent desires in place, yet some of them are discouraged by negative hedonism. The moon's (not) orbiting the earth after I am dead can have no causal impact on me, and hence must be a matter of indifference to me if I am a negative hedonist.

Negative hedonism and thanatizing insulate us from the view that death is harmful to us. However, both strategies leave us vulnerable to harm of other sorts. Both leave us free to make all sorts of plans, only to suffer our plans' failure. To properly assess whether it is advisable to adjust our attitudes so as to fend off the harm of death, it is useful to examine the more general project of developing invulnerability to all harms whatsoever. How might this more extensive adjustment go?

It is accomplished in two steps. First, we equate goodness with happiness, and adopt the no-thwarted desires view of happiness. Second, we eschew all except those desires we can surely satisfy. We might pursue the (autarchist) strategy of allowing ourselves only desires that we can satisfy by our own power. We might limit ourselves to the (conformist) attitude that whatever happens (or whatever happens by necessity) is what we want to happen. More extreme yet, we might adopt the (nihilist) approach of wanting nothing at all. Autarchy, conformism and nihilism stop any event from impairing our happiness. Along the way, they insulate us from the threat of death, by eliminating the desire not to die, as well as any desire whose satisfaction requires our being alive.

Unfortunately, all the strategies we have canvassed have a drawback: they leave us with an impoverished conception of happiness, of what matters. After applying these strategies, our happiness is little more than the absence of unhappiness. For example, Epicurean negative hedonists must say that nothing that happens after they die matters; in particular, they will be indifferent to the suffering of their children -- so long as it will occur after they (the parents) are dead. They are incapable of true love and friendship since these commit us to the judgment that the well-being of another matters for its own sake, while the negative hedonist thinks only one thing matters for its own sake: pain avoidance. (Admittedly, Epicurus claims that friendship is good, but he cannot have it both ways: negative hedonism rules out loving relationships of all sorts.) Arguably, similar remarks apply to people who thanatize their desires (but see Rosenbaum 1989). A thanatized parent cannot sustain real concern for the well-being of her children through independent desires, since such desires leave her indifferent to her children while there is anything that she can do to help her children. At best they can take the attitude, *let my children do well so long as I cannot possibly do anything about them*, which is so bizarre as to be psychologically impossible, and which falls far short of genuine concern, not to say love, since the latter guarantees the attitude, *let my children do well even if I cannot possibly help them*. Autarchics, conformists and nihilists are even more callous: they shrug off the suffering of their children (and everyone else) no matter when it occurs.

Moreover, in avoiding all desires that would leave them vulnerable to death, thanatics, autarchics, conformists and nihilists must give up the view that life is worth living, as well as the projects and concerns that constitute grounds for thinking that life is good, assuming that, in rational beings, the judgment that life is worthwhile prompts the desire to live, which could be thwarted at any time. Any reason to (want to) live is an excellent reason to want not to die; to avoid the latter, we must avoid the former.

However, the core idea of adapting our desires and requirements for happiness is useful, if not taken to an extreme. For what deprives us of happiness is a misfortune. Hence it is imprudent to let our happiness hinge on demands we cannot possibly meet, and better to reshape our most fundamental ideals so that they are manageable. In particular, it is prudent to take the view that we can be happy, or content, with a normal lifespan, which falls far short of immortality. $$This is not to say we should be indifferent about goals we shall never achieve, however. Most of us would be glad to live endlessly under favorable circumstances. But our attitude here should be that attaining immortality moves us well beyond mere happiness, and that being limited to a normal lifespan is not a misfortune.

Omnipotence

Omnipotence is maximal power. Maximal greatness (or perfection) includes omnipotence. According to traditional Western theism, God is maximally great (or perfect), and therefore is omnipotent. Omnipotence seems puzzling, even paradoxical, to many philosophers. They wonder, for example, whether God can create a spherical cube, or make a stone so massive that he cannot move it. Is there a consistent analysis of omnipotence? What are the implications of such an analysis for the nature of God?

1. Introductory Preliminaries

Philosophical reflection upon the notion of omnipotence raises many puzzling questions about whether or not a consistent notion of omnipotence places limitations on the power of an omnipotent agent. Could an omnipotent agent create a stone so massive that that agent could not move it? Paradoxically, it appears that however this question is answered, an omnipotent agent turns out not to be all-powerful. Could such an agent have the power to create or overturn necessary truths of logic and mathematics? Could an agent of this kind bring about or alter the past? Is the notion of an omnipotent agent other than God an intelligible one? Could *two* omnipotent agents coexist? If there are states of affairs that an omnipotent agent is powerless to bring about, then how is the notion of omnipotence intelligibly to be defined? Moreover, an obstacle to traditional Western theism arises if it is impossible for God to be morally perfect and omnipotent. If an omnipotent God is powerless to do evil, then how can he be omnipotent? Rational theology seeks an analysis of the concept of omnipotence that resolves the puzzles and apparent paradoxes that surround this concept. If the notion of omnipotence were found to be unintelligible, or incompatible with moral perfection, then traditional Western theism would be false.

According to some philosophers, omnipotence should be understood in terms of the power to *perform certain tasks*, for instance, to kill oneself, to make 2+2=4, or to make oneself non-omniscient. However, in recent philosophical discussion, the approach has more often been to analyze omnipotence in terms of the power to *bring about certain possible states of affairs* (understood as propositional entities which either obtain or fail to obtain).[1] This approach appears to have been more successful.

One sense of 'omnipotence' is, literally, that of having the power to bring about *any* state of affairs whatsoever, including necessary and impossible states of affairs. Descartes seems to have had such a notion.[2] Yet, Aquinas and Maimonides held the view that this sense of 'omnipotence' is incoherent. Their view can be defended as follows. It is *not* possible for an agent to bring about an *impossible* state of affairs (e.g., *that there is a shapeless cube*), since if it were, it would be possible for an impossible state of affairs to obtain, which is a contradiction.[3] Nor is it possible for an agent to bring about a *necessary* state of affairs (e.g., *that all cubes are shaped*). It is possible for an agent, *a*, to bring about a necessary state of affairs, *s*, only if possibly, (1) *a* brings about *s*, and (2) if *a* had not acted, then *s* would have failed to obtain. Because a necessary state of affairs obtains whether or not anyone acts, (2) is false. As a consequence, it is impossible for an agent to bring about either a necessary or an impossible state of affairs. Obviously, an agent's having the *power* to bring about a state of affairs entails that, *possibly*, the agent brings about that state of affairs. Thus, the first sense of 'omnipotence' is incoherent. Henceforth, it will be assumed that it is not possible for an agent to have the power to bring about *any* state of affairs whatsoever.

A second sense of 'omnipotence' is that of *maximal power*, meaning just that no being could exceed the overall power of an omnipotent being. It does not follow that a maximally powerful being can bring about *any* state of affairs, since, as we have seen, bringing about some such states of affairs is impossible. Nor does it follow that a being with maximal power can bring about whatever any *other* agent can bring about. If *a* can bring about *s*, and *b* cannot, it does not follow that *b* is *not overall* more powerful than *a*, since it could be that *b* can bring about more states of affairs than *a* can, rather than the other way around. This *comparative* sense of 'omnipotence' as maximal power appears to be the only sense that has a chance to be intelligible.

Power should be distinguished from *ability*. Power is ability plus opportunity: a being having maximal ability who is prevented by circumstances from exercising those abilities would not be omnipotent. Nothing could prevent an omnipotent agent from exercising its powers, if it were to endeavor to do so.

In light of the foregoing, could there be two coexistent omnipotent agents, Dick and Jane? If this were even possible, then *possibly*, at some time, *t*, Dick, while retaining his omnipotence, attempts to move a feather, and at *t*, Jane, while retaining her omnipotence, attempts to keep that feather motionless. Intuitively, in this case, neither Dick nor Jane would affect the feather as to its motion or rest. Thus, in this case, at *t*, Dick would be powerless to move the feather, and at *t*, Jane would be powerless to keep the feather motionless! But it is absurd to suppose that an omnipotent agent could lack the power to move a feather or the power to keep it motionless. Therefore, neither Dick nor Jane is omnipotent. Since the idea that there could be two omnipotent beings who are *necessarily* always in perfect agreement is highly

questionable, it seems impossible that there be two coexistent omnipotent agents.

Could an agent be accidentally omnipotent? At first glance, this appears possible, but there is the following argument for the opposite view. On the assumption that God exists, he has necessary existence, is not temporally limited, and is essentially omnipotent. But there could not be two coexistent omnipotent agents. Thus, on the assumption that God exists, an accidentally omnipotent being is impossible.

This argument against the possibility of accidental omnipotence presupposes traditional Western theism. However, traditional Western theism is highly controversial, and *neutrality* about whether God exists has some advantages. If one is neutral about whether God exists, then omnipotence should *not* be assumed to be attributable *only* to the God of traditional Western theism or *only* to an essentially omnipotent being.

2. The Scope of Omnipotence

The intelligibility of the notion of omnipotence has been challenged by the so-called paradox or riddle of the stone. Can an omnipotent agent, Jane, bring it about that there is a stone of some mass, *m*, which Jane cannot move? If the answer is ‘yes’, then there is a state of affairs that Jane cannot bring about, namely, (S1) *that a stone of mass m moves*. On the other hand, if the answer is ‘no’, then there is another state of affairs that Jane cannot bring about, namely, (S2) *that there is a stone of mass m which Jane cannot move*. Thus, it seems that whether or not Jane can make the stone in question, there is some possible state of affairs that an omnipotent agent cannot bring about. And this appears to be paradoxical.

A first resolution of the paradox comes into play when Jane is an *essentially* omnipotent agent. In that case, the state of affairs of Jane’s being non-omnipotent is impossible. Therefore, Jane cannot bring it about that she is not omnipotent. Since, necessarily, an omnipotent agent can move any stone, no matter how massive, (S2) is impossible. But, as we have seen, an omnipotent agent is not required to be able to bring about an impossible state of affairs.

If, on the other hand, Jane is an *accidentally* omnipotent agent, both (S1) and (S2) *are* possible, and it *is* possible for some omnipotent agent to bring it about that (S1) obtains at one time, *and* that (S2) obtains at a different time. Thus, there is a second solution to the paradox. In this case, Jane’s being non-omnipotent is a possible state of affairs; thus, we may assume that it *is* possible for Jane to bring it about that she is non-omnipotent. So, Jane can create and move a stone, *s*, of mass, *m*, while omnipotent, and *subsequently* bring it about that she is not omnipotent and powerless to move *s*. As a consequence, Jane can bring about both (S1) and (S2), but only if they obtain at different times.[4]

It might now be conjectured that omnipotence can be analyzed simply as the power to bring it about that any *contingent* state of affairs obtains. However, the following list of contingent states of affairs shows that there can be contingent states of affairs that an omnipotent agent is powerless to bring about, and hence that this simple analysis is inadequate:

a. that a raindrop fell;
b. that a raindrop falls at *t* (where *t* is a past time);
c. that Parmenides lectures for the first time;
d. that the Amazon River floods an odd number of times less than four;
e. that a snowflake falls and no omnipotent agent ever exists; and
f. that Plato freely decides to write a dialogue.

Note that (a) is a past state of affairs. Presumably, it is not possible for an efficient cause to occur *later* than its effect. However, an agent's bringing about a state of affairs is a kind of efficient causation. Therefore, it is not possible for an agent to bring about anything that is in the *past*. In other words, it is impossible for *any* agent to have power over what is past. Hence, no agent, not even an omnipotent one, can bring it about that (a) obtains. Likewise, despite the fact that (b) can be brought about *prior* to *t*, the impossibility of an agent's having power over what is past implies that *after t* even an omnipotent agent cannot bring it about that (b) obtains. In the case of (c), prior to Parmenides's first lecture, an omnipotent agent can bring about (c). But once Parmenides has lectured, even an omnipotent agent cannot bring it about that (c) obtains. As for (d), prior to the Amazon's third flooding, an omnipotent agent can bring it about that (d) obtains, while after the Amazon's third flooding, even an omnipotent agent cannot bring it about that (d) obtains. (e) introduces a special difficulty. Although it is obvious that (e) could *not* be brought about by an omnipotent agent, it can be argued plausibly that it *is* possible for a non-omnipotent agent to bring about (e) by causing a snowflake to fall, *provided that* no omnipotent agent ever exists.[5] But, as we argued earlier, a maximally powerful being need not have the power to bring about every state of affairs that any other being could. Lastly, while if the libertarian theory of free will is correct, an omnipotent agent (who is, of course, *other than Plato*) cannot bring about (f), apparently a non-omnipotent agent, namely, Plato, can bring it about that (f) obtains.

Consequently, a satisfactory analysis of omnipotence ought not to require that an omnipotent agent have the power to bring about (a), (b), (c), (d), (e), or (f), if it is assumed, *arguendo*, in the case of (f), that libertarianism is true.

Because of the wide disparity among contingent states of affairs, (a)-(f), one might despair of finding an analysis of omnipotence that both deals satisfactorily with all of these states of affairs and implies that an omnipotent being has, intuitively speaking, sufficient power. Is such pessimism warranted, or is omnipotence analyzable?

There are at least two approaches to analyzing omnipotence that hold out some hope of success. The first utilizes the notion of an *unrestrictedly repeatable state of affairs*, and the second utilizes the notion of *two worlds sharing their histories up to a time*. Although these approaches to analyzing omnipotence differ in important ways, they are in broad agreement on the leading idea that maximal power has logical and temporal limitiations, including the limitation that an omnipotent agent cannot bring about, i.e., cause, another agent's free decision in the libertarian sense. In the following two sections, some recent instances of these approaches are set forth and compared.

3. Omnipotence and Unrestricted Repeatability

One attempt to analyze omnipotence in terms of unrestricted repeatability is the account of Hoffman and Rosenkrantz. According to their approach, by identifying certain features of (a)-(f), we can find a feature that none of them possesses, and in terms of which an analysis of omnipotence can be stated.[6] To begin, unless it is possible for *some* agent to bring about a given state of affairs, an omnipotent agent ought not to be required to be able to bring about that state of affairs. But (a) is not possibly brought about by any agent.

Next, while (b) and (c) are possibly brought about by some agent, they are not *repeatable*: it is not possible for either one of them to obtain, subsequently fail to obtain, and then obtain again. Note that if, because (a) is not possibly brought about by someone, an omnipotent agent is not required to be able to bring about (a), then for the same reason, that agent is also not required to be able to bring about impossible or necessary states of affairs. Moreover, if, because (b) and (c) are not repeatable, an omnipotent agent is not required to bring about (b) or (c), then for the same reason, that agent is also not required to be able to bring about impossible or necessary states of affairs. These reasons for not requiring an omnipotent agent to have the power to bring about impossible or necessary states of affairs cohere with our earlier independent arguments for these restrictions.

Third, while (d) *is* repeatable, it is *not unrestrictedly* repeatable, that is, it cannot obtain, then fail to obtain, then obtain again, and so on, eternally.

Fourth, while (e) *is* unrestrictedly repeatable, it is a *complex* state of affairs, namely, a *conjunctive* state of affairs whose second conjunct is *not* repeatable. These examples suggest a hypothesis about repeatability and its relation to power, namely, that an omnipotent agent should *not* be required to have the power to bring about *either* a state of affairs that is not unrestrictedly repeatable, *or* a conjunctive state of affairs one of whose conjuncts is not unrestrictedly repeatable.

Lastly, although (f) *is* unrestrictedly repeatable, (f) is another type of complex state of affairs. In particular, it is identifiable with or analyzable as a conjunctive state of affairs. This state of affairs has three conjuncts, the second of which is not possibly brought about by anyone. The conjunctive state of affairs in question can be informally expressed as follows: Plato decides to write a dialogue; and there is no *antecedent* sufficient causal condition of Plato’s deciding to write a dialogue; and there is no concurrent sufficient causal condition of Plato’s deciding to write a dialogue. Because it is impossible for an agent to have power over what is *past*, the second conjunct of this state of affairs is not possibly brought about by anyone. Thus, an omnipotent agent ought not to be required to have the power to bring about a state of affairs that is identifiable with or analyzable as a conjunctive state of affairs one of whose conjuncts is not possibly brought about by anyone.

According to the account of Hoffman and Rosenkrantz, incoporating these ideas, omnipotence can be analyzed in terms of the following three definitions.

($D1$) The period of time t is a sufficient interval for $s =_{df} s$ is a state of affairs such that: it is possible that s obtains at a time-period which has the duration of t.

For example, any period of time with a duration of 7 seconds is a sufficient interval for the state of affairs *that a ball rolls for 7 seconds*.

($D2$) A state of affairs, s, is unrestrictedly repeatable $=_{df} s$ is possibly such that: $\forall n \exists t_1 \exists t_2 \exists t_3 \ldots \exists t_n [(t_1 < t_2 < t_3 < \ldots < t_n$ are periods of time which are sufficient intervals for s & s obtains at t_1 & s doesn't obtain at t_2 & s obtains at t_3 & … & s obtains at t_n) if and only if n is odd].[7]

For instance, the state of affairs *that a ball rolls for 7 seconds* is unrestrictedly repeatable.

($D3$) x is omnipotent at $t =_{df} \forall s$(if it is possible for some agent to bring about s then at t x has it within his power to bring about s).

In *D3*, x ranges over agents, and s over states of affairs that satisfy the following condition:

(C) (i) s is unrestrictedly repeatable, and of the form 'in n minutes, p', & (p is a complex state of affairs $\rightarrow$ (each of the parts of p is unrestrictedly repeatable & possibly brought about by someone)), or (ii) s is of the form 'q forever after', where q is a state of affairs which satisfies (i).[8]

In applying *D3* to states of affairs like (e) and (f) it should be observed that a *conjunct* of a conjunctive state of affairs is a *part* of such a complex state of affairs.[9]

As intended, *D3* does not require an omnipotent agent to have the power to bring about either impossible or necessary states of affairs, or states of affairs such as (a)-(f). Furthermore, *D3* does not unduly limit the power of an omnipotent agent, since an agent's bringing about a state of affairs can always be "cashed out" in terms of that agent's bringing about an unrestrictedly repeatable state of affairs that it is possible for some agent to bring about. That is, necessarily, for any state of affairs, s, if an agent, a, brings about s, then either s is an unrestrictedly repeatable state of affairs which it is possible for some agent to bring about, or else a brings about s *by* bringing about q, where q is an unrestrictedly repeatable state of affairs which it is possible for some agent to bring about. For instance, an omnipotent agent can bring about the state of affairs, *that in one hour*, *Parmenides lectures for the first time*, by bringing about the state of affairs, *that in one hour*, *Parmenides lectures*, when this lecture is Parmenides's first. And although the former state of affairs is a nonrepeatable one that *D3* does *not* require an omnipotent agent to be able to bring about, the latter state of affairs *is* an unrestrictedly repeatable state of affairs that *D3* *does* require an omnipotent agent to be able to bring about.

4. Omnipotence and the Shared Histories Approach

The alternative approach to analyzing omnipotence in terms of two worlds sharing their histories up to a time is exemplified by the accounts of Flint and Freddoso, and Wierenga. As we shall see, although these two accounts are similar, they differ in certain significant respects.

Flint and Freddoso's account of what it is for an agent *S* at a time *t* to be omnipotent in a possible world *W* is formulated as follows.

> *S* is omnipotent at *t* in *W* if and only if for any state of affairs *p* and world-type-for-*S Ls* such that *p* is not a member of *Ls*, if there is a world *W** such that
>
> 1. *Ls* is true in both *W* and *W**, and
> 2. *W** shares the same history with *W* at *t*, and
> 3. at *t* in *W** someone actualizes *p*, then *S* has the power at *t* in *W* to actualize *p*.[10]

The notion of a world-type-for-*S Ls* is to be understood in the following way. A *world-type* is "a set which is such that for any *counterfactual of freedom*, i.e., any proposition which can be expressed by a sentence of the form 'If individual essence *P* were instantiated in circumstances *C* at time *t* and its instantiation were left free with respect to action *A*, the instantiation of *P* would freely do *A*' -- either that counterfactual or its negation is a member of the set."[11] It may also be stipulated "that for any two members of the set, the conjunction of those two members is a member of the set as well."[12] Moreover, "a world-type is *true* just in case every proposition which is a member of it is true."[13] In addition, it is presupposed that "for any free agent *x*, there will be a set of all and only those true counterfactuals of freedom (or true negations of such counterfactuals) over whose truth-value *x* has no control."[14] A set of this kind is referred to as *the world-type-for-x*. Finally, '*Lx*' designates the true-world-type-for-*x*.

The notion of actualization employed in this account of omnipotence calls for some explanation. If an agent, *S*, brings about a state of affairs, *p*, then *S* actualizes *p*. However, this account presupposes that an agent may [*weakly*] actualize another agent's making a *free* decision without *bringing about* or *causing* that decision. In particular, it is assumed that an agent may weakly actualize a decision that is free in the libertarian sense by bringing about the antecedent of a true "counterfactual of freedom."

The basic idea of this account of omnipotence is that an agent is omnipotent just when he can actualize any state of affairs that it is possible for someone to actualize, except for certain "counterfactuals of freedom", their consequents, and certain states of affairs that are "accidentally impossible" because of the past.

With respect to so-called counterfactuals of freedom, this account presupposes that some of them, for

example,

> If Jessica were offered the grant, then she would freely decide to accept it,

are *true*. Some philosophers hold the contrary view that a subjunctive conditional of this kind is *necessarily false*. Why do these philosophers reject the claim that some "counterfactuals of freedom" are true? Presumably, what distinguishes a subjunctive conditional from a corresponding material conditional is that only the former expresses a strong or necessary connection of some sort between the conditions specified by the antecedent and the consequent. Seemingly, the only kinds of strong or necessary connections available in this case are relations [broadly speaking] of either *causation* or *entailment*. Consequently, it appears that the subjunctive conditional under discussion is necessarily false, since if Jessica *freely* decides to accept the grant [in the relevant libertarian sense], then her making that decision is neither *caused* nor *entailed* by her being offered the grant. If the foregoing line of reasoning is correct, then the notion of a true "counterfactual of freedom" is incoherent. Since Flint and Freddoso's account of omnipotence presupposes that there are such "counterfactuals of freedom," it can be argued that this account is incoherent.

Moreover, it can be argued that a state of affairs discussed earlier provides a counter-example to Flint and Freddoso's account of omnipotence, namely:

> (e) A snowflake falls and no omnipotent agent ever exists.

A non-omnipotent agent can bring about or actualize (e) by bringing it about that a snowflake falls when in fact no omnipotent agent ever exists. But, it is clear that an omnipotent agent cannot bring about or actualize (e). For although an omnipotent agent can bring it about that a snowflake falls, surely, an omnipotent agent cannot bring it about that *no omnipotent ever exists*, nor would this conjunct of (e) obtain if there were an omnipotent agent. Moreover, we may assume that there are possible worlds, *W* and *W**, such that *W* and *W** share the same history up to a time *t*, no omnipotent agent ever exists in *W**, and a contingently omnipotent agent, Oscar, is omnipotent for the first time at *t* in *W*. We may also assume that *W** is a world in which at *t* some non-omnipotent agent actualizes (e). On the other hand, evidently, if in *W*, Oscar is omnipotent at *t*, then at *t* Oscar cannot actualize (e). Note that since the second conjunct of (e) is not unrestrictedly repeatable, this is consistent with Hoffman and Rosenkrantz's account of omnipotence; their account does not require an omnipotent agent to be able to bring about a conjunctive state of affairs one of whose conjuncts is not unrestrictedly repeatable. On the other hand, Flint and Freddoso's account of omnipotence implies that in *W*, at *t* Oscar has the power to actualize (e). This implication holds for the following reasons. First, (e) is not a member of a world-type-for-Oscar, inasmuch as (e) is neither a "counterfactual of freedom," the negation of one, nor a conjunction of such "counterfactuals of freedom." Second, we may assume that a world-type-for-Oscar is true in both *W** and *W*, since the assumption that an agent is not omnipotent in one possible world, and is omnipotent for a time in another possible world, does not necessitate any difference in the world-type for that agent which is true in those worlds. Third, it is possible for someone at *t* to actualize (e) in a world, *W**, that has the same history up to *t* as *W*.[15] Thus, arguably, Flint and Freddoso's account of omnipotence requires that

in *W* an omnipotent agent, Oscar, at *t* has the power to actualize (e), when Oscar lacks this power. If this is right, then their account does not provide a logically necessary condition of omnipotence.[16]

A counter-example of this kind assumes that an analysis of omnipotence should allow for the possibility of an omnipotent agent other than God. Given this assumption, (e) seems to provide a counter-example to Flint and Freddoso's account of omnipotence, but not to the account of Hoffman and Rosenkrantz.

Let us now turn to Wierenga's account of omnipotence.. The basic idea of Wierenga's account of omnipotence is that an agent is omnipotent if and only if he can do anything that it is possible for him to do, given the past. According to this account, we can analyze what it is for an agent, *A*, to be omnipotent at *t* in a world *W* in terms of what it is *possible for A* to strongly actualize at *t* in worlds having the same history as *W* up to *t*.

Wierenga's account of omnipotence, like Flint and Freddoso's, relies on the intuitive idea that two possible worlds can share the same past or history up to a certain point in time, and then diverge. According to Wierenga's account, two worlds of this kind share an *initial segment*, where *S* (*W*, *t*) is an initial segment of a possible world *W* up to a time *t*.[17] Unlike Flint and Freddoso's account, Wierenga's account is not stated in terms of what an agent can actualize, but rather in terms of the narrower notion of what an agent can *strongly actualize*. An agent, *A*, strongly actualizes just those states of affairs that *A* brings about *directly* or those actions that *A* does not do *by* doing something else.[18] Of course, an agent may actualize a state of affairs *indirectly* by strongly actualizing *another* state of affairs. Wierenga's account of omnipotence is formulated as follows.

A being *x* is omnipotent in a world *W* at a time *t* =df. In *W* it is true both that (i) for every state of affairs *A*, if it is possible that both *S* (*W*, *t*) obtains and that *x* strongly actualizes *A* at *t*, then at *t x* can strongly actualize *A*, and (ii) there is some state of affairs which *x* can strongly actualize at *t*.[19]

This account of omnipotence may be vulnerable to a counter-example of the following kind. Arguably, there could be an agent, *x*, such that: *x* has a wide range of powers, *x* is essentially limited to these powers, and *x* essentially lacks a power, *P*, which an omnipotent agent ought to possess. Of course, *x* would not be omnipotent. Yet, Wierenga's account of omnipotence paradoxically implies that *x* would be omnipotent. Hence, it can be argued that Wierenga's account does not provide a logically sufficient condition for omnipotence. The assumption that there could be a non-omnipotent agent that is essentially limited in its powers can be defended as follows. An omnipotent agent has the power to overrule (or supersede) any law of nature (a mere *physical necessity*). For example, God has the power to overrule the law of gravity by bringing it about that a mountain floats in midair without any physical cause. Yet, arguably, it is possible for there to be a non-omnipotent agent who essentially lacks the power to overrule any law of nature. For example, it can be argued that there could be a physical or material agent who is *essentially* subject to certain laws of nature. Surely, such an agent would lack the power to overrule any law of nature, and so would not be omnipotent.

A similar, though weaker, sort of objection concerns McEar, a hypothetical agent who essentially has the

power to do only *one* thing, namely, scratch his ear. It may be objected that Wierenga's analysis of omnipotence falsely implies that McEar would be omnipotent. But it might be replied that an agent such as McEar is impossible. It can be cogently argued that, necessarily, if McEar has the power to scratch his ear, then he *also* has the power to move a part of his body to scratch his ear, for instance, his arm.[20] So, it appears that there could not be an agent that has the power to do only one thing. In reply to the stronger sort of objection discussed earlier, it may be suggested that, necessarily, for *any* power, if an agent lacks that power, then an omnipotent being could give that agent that power.[21] The difficulty with such a reply is that there could be a non-omnipotent agent who *essentially* lacks the power to overrule any law of nature, and hence that not even an omnipotent agent could give this non-omnipotent agent that power.

5. Omnipotence and Divine Moral Perfection

It has been argued that the traditional God has incompatible attributes, namely, necessary existence, essential omnipotence, essential omniscience, and essential moral perfection.[22] The contention has been that it is impossible for God to have the power to bring about evil, while non-omnipotent (and morally imperfect) beings may have this power. The precise form of such an argument varies depending on what precisely the relation between God and evil is assumed to be. However, generally speaking, it is argued that divine moral perfection and omnipotence are incompatible because divine omnipotence entails that God has the power to bring about evil, whereas divine moral perfection entails that God is powerless to bring about evil.

One can respond to arguments of this kind as follows. Assume that if God exists, then this is a best possible world.[23] In that case, if God exists, there could not be an evil unless it were necessary for some greater good, in which case any state of affairs containing evil incompatible with there being a maximally good world is *impossible*. But it be may be assumed that it is not possible for *any* agent to bring about an impossible state of affairs. Thus, if God exists, any moral evil, that is, any evil brought about by anyone, and any natural evil, or any evil which has an impersonal, natural cause, must be necessary for some greater good.

Suppose that God exists and that some other person, for example, Cain, brings it about that an evil, *E*, exists. There are two possibilities that need to be considered here. The first is that Cain's decisions and actions are causally determined, as are all occurrences in the created universe. Then, given our assumptions, since Cain's bringing it about that *E* exists is necessary for some good which more than compensates for *E*'s existence, it is consistent with God's moral perfection that God [remotely] brings it about that Cain brings it about that *E* exists.

The second possibility is that Cain's decision to do evil is uncaused by anything other than Cain and free in the libertarian sense. In that case, God did *not* [remotely cause Cain freely to] bring it about that *E* exists, while [let us assume] Cain *did* freely bring it about that *E* exists. If so, then it must be the case that God's creating Cain and permitting Cain freely to do what he chooses to do [in the context of the entire creation] brings about more good than his *not* creating Cain and thus *not* permitting him freely to do what

he chooses to do. It might be objected that if Cain can bring about a state of affairs that God cannot, namely, *that E exists*, then God is not omnipotent. But, as we have seen, an agent's being omnipotent does not require of that agent that it be able to bring about *every* state of affairs which *any* other agent can bring about. It *does*, of course, require that an omnipotent agent have more power than any other agent. And God, of course, *would* have more power than Cain, even though Cain could bring about something that God could not. For there are many more states of affairs that God could bring about and that Cain could not, than *vice versa*. At this point, it might further be objected that an omnipotent agent, one that was morally imperfect, who *could* bring it about that *E* exists, as well as all the other states of affairs that God could bring about, would be more powerful than God. But recall that if God exists, then he exists eternally in every possible world. Recall, too, that there cannot be more than one omnipotent agent. Thus, if God exists, then an omnipotent agent who is morally imperfect is *impossible*. Thus, this second objection is based on an assumption that is impossible, namely, that if God exists there could exist another omnipotent agent who is morally imperfect and who is therefore more powerful than God.

Of course, if God exists, then any evil state of affairs, *s*, which *is* incompatible with a maximally good world is *impossible*. And if *s* is impossible, then neither God nor any other agent has the power to bring it about that *s* obtains. God would lack the power to bring it about that *s* obtains because of his moral perfection, and any created agent would lack the power to bring it about that *s* obtains either because (i) God would not create an agent who had the power to bring it about that *s* obtains, or (ii) God would not permit any created agent to bring it about that *s* obtains. Thus, to the extent indicated, if God's attributes impose moral restrictions on the nature of the universe and on what he can bring about, then they impose parallel restrictions on what any other agents can bring about.

The foregoing line of reasoning implies that God's moral perfection and omnipotence are not incompatible.[24]

This argument about God and the possibility of evil has been disputed by theists such as Alvin Plantinga, who do not hold that God's existence implies the existence of a maximally good world, but do hold that God seeks to create as good a world as he can.[25] Theists such as Plantinga allow for there to be evil that is *unnecessary* for any greater good that outweighs it. An evil of this kind involves free decisions of non-divine agents, which God does not prevent, but which these other agents can prevent. Plantinga contends that God is not wrong to permit an evil of this kind, since God cannot bring about a vital good, the existence of free human agents, without there being such an evil. Alternatively, it might be argued that God does no wrong in this sort of case, because he does not know how to do better (knowledge of the future free actions of created agents being impossible). However, as an omnipotent God is *not* required to have power over the free decisions of non-divine agents, it follows that on these views, his omnipotence and moral perfection are compatible, roughly to the extent indicated earlier in our discussion of the view that God's existence implies a maximally good world. Of course, nothing that has been said here answers the question of how much, if any, evil is compatible with the existence of the traditional God. This question is central to the problem of evil for theism.

Stanford Encyclopedia of Philosophy
Notes to Omnipotence

Notes

1. This approach is taken in Rosenkrantz & Hoffman 1980; Flint & Freddoso 1983; and Wierenga 1989, pp. 12-35.

2. René Descartes *Meditations on First Philosophy*, Meditation 1.

3. St. Thomas Aquinas, *Summa Theologiae*, Ia, 25, 3; and Maimonides, *Guide for the Perplexed*, part I, chap. 15.

4. For a discussion of the paradox of the stone and a useful bibliography concerning this paradox, see Rosenkrantz & Hoffman 1980.

5. Such an argument is based on two premises. The first premise is a plausible version of the principle of *the diffusiveness of power* which implies that for any agent, *A*, and for any states of affairs *p* & *q*, if *A* brings about *p*, *q* obtains, and *q* is not within the power of any agent other than *A*, then *A* brings about (*p* & *q*). The second premise is that possibly [(a non-omnipotent agent brings it about that a snowflake falls) & (no omnipotent agent ever exists) & (it is not within the power of any agent to bring it about that an omnipotent agent exists at some time)]. It is plausible that this conjunction is possible provided that an accidentally omnipotent agent is possible. See Hoffman & Rosenkrantz 1988.

6. Hoffman & Rosenkrantz 2002, chap. 8.

7. In *D2*, ‘*n*’ ranges over all natural numbers, and $t_1 \ldots t_n$ are nonoverlapping. In addition, it is assumed for the purposes of *D2* that either it is possible for time to have no beginning, or it is possible for time to have no end (or both).

8. It should be noted that in (C), ‘*n*’ ranges over real numbers, and *p* is not itself equivalent to a state of affairs of the form ‘in *n* minutes, *r*’, where *n* is not equal to zero.

9. A complex state of affairs is one which is either constructible out of other states of affairs by use of the logical apparatus of first-order logic enriched with whatever modalities one chooses to employ, or else analyzable (in the sense of a philosophical analysis) into a state of affairs which is so constructible. Therefore, a *part* of a complex state of affairs, *s*, is one of those states of affairs out of which *s*, or an analysis of *s*, is constructed. The relevant notion of a *part* in this context is that of a logical part, as

opposed to a spatial part or a temporal part.

10. Flint & Freddoso 1983, p. 99.

11. Flint & Freddoso 1983, p. 96.

12. Flint & Freddoso 1983, pp. 96-97.

13. Flint & Freddoso 1983, p. 97.

14.Flint & Freddoso 1983, p. 97.

15. Note that if *W* and *W** sharing the same history up to *t* implies that *W* and *W** share the same natural laws up to *t*, then in *W* there is no sufficient causal condition for Oscar becoming omnipotent at *t*. However, the libertarianism of Flint and Freddoso presupposes that some events, i.e., all free decisions, lack a sufficient causal condition, and there seems to be no good reason to deny the possibility of events that have no sufficient causal condition, especially in the light of current understandings of quantum mechanics.

16. There are variations on (e) that may provide additional counter-examples to Flint and Freddoso's account of omnipotence. For instance, consider the following possible state of affairs:

> (e*) A snowflake falls & ~(Oscar brings about something at some time during his life).

Suppose that Oscar is a contingently existing omnipotent agent. It can be argued that although it is impossible for Oscar to bring about (e*), it is possible that a non-omnipotent agent other than Oscar brings about (e*) by bringing about *both* of its conjuncts, even when Oscar is omnipotent. Arguably, a non-omnipotent agent of this sort could accomplish this by causing a snowflake to fall and destroying Oscar before he brings about something. It can be argued that such a case provides a counter-example to Flint and Freddoso's account of omnipotence similar to the one based on (*e*).

17. Wierenga 1989, pp. 18-20.

18. Wierenga 1989, pp. 20-23.

19. Wierenga 1989, p. 25.

20. Wierenga 1989, pp. 28-29.

21. Wierenga 1989, p. 29.

22. Pike 1969. Pike argues that divine omnipotence and perfect goodness are incompatible. For a discussion of the compatibility of divine omnipotence and perfect goodness, see Hoffman 1979.

23. Whether divine moral perfection should be understood as perfect goodness, perfect virtue, or an optimal combination of goodness and virtue, depends upon whether the correct theory of morality is consequentialist, deontological, or *mixed* (that is, a mixture of core elements of consequentialist and deontological moral theories). To preserve our neutrality on this controversial question in this context, in the main text we use expressions such as ‘best possible world’ and ‘maximally good possible world’ to refer to *either* a possible world of unsurpassable goodness, a possible world governed by a being of unsurpassable virtue, or a possible world with an optimal balance of goodness and virtuous governance. For a discussion of these alternative conceptions of divine moral perfection see Hoffman & Rosenkrantz 2002, chap. 7.

24. Although from what we have said about the restrictions that any coherent account of God’s power must place on this power, a better term for God’s power than ‘omnipotence’ would be ‘maxipotence’.

25. Plantinga 1974. This work is an influential free will defense of theism against the problem of evil. A number of philosophers have argued against some of the presuppositions of Plantinga’s view, and in particular, against the acceptance of so-called counterfactuals of freedom.

Cosmology: Methodological Debates in the 1930s and 1940s

Sometimes, philosophy drives science. Cosmology between 1932-48 provides an excellent example how explicitly philosophical considerations directed the evolution of a modern science during a crucial period of its development. The following article exhibits these philosophical aspects of cosmological thinking in detail, beginning with a brief sketch of the historical development of general relativity cosmology until 1932. Following this, the historical participants in the philosophical debate are introduced, along with the basic ideas of their competing positions. Then the critical stages of the debate -- 1935-37 -- are closely explored by focussing directly upon the arguments of the participating scientists and philosophers. Finally, the concluding stage of the philosophical debate, namely, the emergence of the steady-state theory of the Universe, is presented in the context of its development from Popper's philosophy of science.

---

1. Introduction

One of the most vigorous philosophical debates of the century broke out among cosmologists during the 1930s and 1940s. At the peak of the debate, 1936-37, many of the most prominent scientists in Britain, as well as several leading philosophers of science, had gotten themselves publically involved. Their

arguments, attacks and rebuttals were chronicled in many of the leading scientific journals, including a special edition of the foremost general scientific journal, *Nature*, devoted entirely to philosophical arguments and counter-arguments.

Methodology was the central issue of the debate, although metaphysical questions also arose, particularly those concerning the actual reality of certain structures and forces imputed to the Universe by the new cosmological theories and observations. But in the end, methodology was the real goad spurring on most of the participants.

At bottom, there were just two opposing positions in the debate, each of which comprised a two-point stance. On one side were those scientists who had their roots mostly in the experimental side of natural science. To them, there was one and only one legitimate method for science. Theory construction, they believed, involved two closely-linked steps. First, one began from the *empirical observations*, that is, from measurements, manipulations, experiments, whose results were evident to the human senses; this is classic *empiricist* epistemology. Observational results would then suggest possible hypotheses to examine via further empirical testing. When enough data concerning the hypothesis had been gathered, *logical generalization* could be carried out, thereby producing a theory; this is classic *inductivist* logic.

Opposing these inductive-empiricist scientists were those whose roots were mostly in the theoretical side of natural science, most especially mathematical physics. To them, there was another, more logically sound, method to construct theories. First, *hypotheses* could be generated in any fashion, although most believed that imagining hypotheses which were based upon very general, very reasonable concepts—that the Universe's physical processes had simple mathematical descriptions, for example—was the best place to begin; this is classic *rationalist* epistemology. Once the hypothesis had been generated, strict analytical reasoning could be used to make predictions about observations; this is classic *deductivist* logic. Scientists who held this view came to be called *hypothetico-deductivists*; their views about both hypothesis generation and deductive predictions were each strongly opposed by the inductive-empiricists.

Part of the controversy may be laid to the fact that cosmology was a new science, and disputes about methodology in new sciences are not rare in the history of the sciences. What is rare about this case, however, is the vigor, sometimes even bitterness, with which the philosophical controversy was waged. Another reason for the controversy lies in the fact that cosmology is a data-poor science: observations are hard-won and rare, and they frequently must be run through elaborate theoretical manipulations and corrections in order to make sense at all. With a paucity of data results, scientists must rely upon philosophical argument to undergird their views about how the scientific work should be done.

One final feature of the debate must be noted. The participants are almost universally scientists, and not philosophers. Yet this does not much affect the level of philosophical thinking going on; these scientists knew their philosophy well, and they wielded philosophy's weapons and defenses with great skill. In the end, their debate shaped cosmology into the science we know today.

It will be useful to look briefly at the history of cosmology leading up to the debate.

2. The Lead-up to the Debate

Since about 1700 theories about the nature and structure of the Universe were derived from Newtonian theory, most especially his theory of gravitation, which was used to account for the behavior of heavenly bodies and their systems. Newton's theory hypothesized a force—gravitation—acting upon material bodies, free to move over time within the passive, inert ‘container’ of three-dimensional space. Bodies, paths, and space itself exemplified the classical geometry of Euclid. All these features changed with the publication of Einstein's General Theory of Relativity, 1915-17.

2.1 Einstein's General Theory of Relativity

Einstein's intended his theory to replace Newton's theory of gravitation completely. In Einstein's view, gravity was not a force existing independently of the spatial ‘container’; rather, gravitation arises as a curvature of the space (and time, which is necessarily connected to space in the new theory), which means that geometry and gravity and astronomical behavior are all intimately connected. For example, near the sun the geometrical structure, the curvature, of spacetime changes radically, which expresses itself as an increasing velocity of incoming orbiting bodies such as comets or satellites. One immediate, and to some, puzzling, consequence of Einstein's theory is that the geometry of the Universe is no longer taken to be Euclidean. Although there are several different candidates for the actual geometry of space, it was not known which is correct.

It was not recognized at first that the General Theory of Relativity could be applied to the Universe as a single, whole, individual object, thereby producing a new cosmological theory, one completely different from its predecessors. Although the mathematics involved are extremely difficult, two solutions, one by Einstein himself, the other by the Dutch astronomer Willem de Sitter, were produced in just a short time in 1917. Unfortunately, the universes predicted by the two solutions were extreme: Einstein's universe would be densely packed with matter, whereas de Sitter's would be essentially empty.

Obviously, the universe as observed by astronomers did not conform at all to the description provided by either solution, a fact many found troubling. Moreover, no additional solutions were forthcoming (even though both Friedmann and LeMaître had developed alternatives, they remained unknown and unnoticed). For nearly twelve years, the new cosmology appeared to be going nowhere. Then Hubble at California's Mt. Palomar made public his astonishing observations of a cosmic Doppler shift, a shift toward the red in the color of light coming from the most distant star systems.

2.2 Hubble's Expanding Universe

Most cosmologists—with the interesting exception of Hubble himself—came to the immediate conclusion that the red shift could only mean that the universe was expanding. Immediately the relativity theorists were able to interpret the expansion as a continuous change in the geometry of spacetime, which was thoroughly accounted for by the General Theory of Relativity. After over a decade of stagnation in

face of the meager choice between just two models of the cosmos, Hubble's observations spurred theorists on to the construction of a melange of new models, each vying in competition with the other.

In the end, it was the Belgian astronomer Georges LeMaître's theory of an expanding universe that came to be accepted. LeMaître's model was publically proclaimed as appropriate and generally correct during a special session of the British Association for the Advancement of Science, 31 Oct 1931. Modern scientific cosmology had been officially born; because of its birth within the context of Einstein's theory of relativity, the new cosmology became quickly and broadly known as *Relativistic Cosmology*. The model of this cosmology is most famously that of the blowing up of a balloon painted with dots to represent galaxies. Over time, the radius of the model's spherical space (the balloon) increases, thereby decreasing the curvature of the space (the balloon's skin), and increasing the distance between the dots.

Although cosmologists came from Europe and America as well as Britain, most of the work in theoretical cosmology took place in London, Cambridge and Oxford. Americans Hubble, Tolman and Robertson did their work at CalTech in Pasadena, but were frequently in England; and most of the European and British workers cycled through Pasadena at one time or another. De Sitter, from Holland, and LeMaître, from Belgium, spent important periods in England, as did various of the German workers. Thus, even though cosmology was done throughout the Western world, its major concentrating point was England; our focus in what follows will be the same.

3. Cosmology and its philosophy

Because it represented such a radical departure from previous scientific thinking about the Universe, relativistic cosmology needed to work out its philosophical underpinnings, most especially in regard to its methodology. ‘How is this new science to be conducted?’ was thus a compelling question. But method, of course, is always linked to metaphysics and epistemology. A full-blown philosophical discussion was evidently required. It came soon enough: within a span of less than a year, a vigorous debate between two philosophically opposed camps developed. The debate required nearly two decades to reach its full resolution. But, with the resolution, cosmology had philosophically certified its methodology within the context of a concensus metaphysics and epistemology. Before going into the details of the debate, however, several general points should be noted. Let us turn to the details of the origin of the debate.

3.1 Relativistic Cosmology: the majority philosophy

To begin with, the cosmological thinking of the majority of scientists—including Eddington, de Sitter, Robertson, Tolman, and their colleagues—had betrayed a relatively unexamined, and apparently uncontroversial cluster of philosophical perspectives: on the metaphysical side they held a modest sort of *explanatory realism*—if an accepted theory referred to entity *x*, then *x* was acceptable as a genuinely, physically real object; to this metaphysical stance was coupled a methodology exhibiting a classic sort of *inductive empiricism*—scientific knowledge consisted of generalizations built up from individual empirical observations. But this cluster of views did not go long unchallenged. In early July 1932, just nine months after relativistic cosmology became the concensus during the British Association meeting,

Oxford astrophysicist E. A. Milne published a short article in *Nature* which directly attacked the current philosophical tenets, proposing their replacement by a new cluster of views, one as radical as the new science it purported to undergird.

3.2 Milne's Philosophical Challenge

Milne's metaphysical views were based in positivism, most especially in *operationalism*: only those objects whose properties could be directly revealed by some observational procedure, or operation, were to be counted among the real. Thus, for Milne, reality did not contain the usual relativistic cosmology referents “curved space”, “expanding space” or even “four-dimensional spacetime”, simply because none of these entities were operationalizable. Milne held that ‘what you saw was what you got’; since “curved space” of various geometries couldn't be observed, space was just as it looked—Euclidean. In the same way, the expanding of the Universe was a genuine expanding—each galaxy was retreating from each other—not just a change in the geometry of the curvature, as it was for the relativists. Moreover, in place of relativistic cosmology's inductive empiricism, Milne opted for a *hypothetico-deductive rationalism*. Cosmologists, Milne believed, were bound to dream up any and all possible models of a universe, and then deduce what, if any, observable consequences followed from their hypotheses. Hypothesizing could be based upon just about anything, although Milne believed that certain very general rational principles derived from aesthetic beliefs about universal order and regularity would be the most fruitful. His ‘*cosmological principle*’, namely, that every cosmologist in the universe should look out upon the same cosmos, was the prime example of such thinking. Later, Bondi would found Steady-state Cosmology on an even more general version of Milne's principle, which he called the ‘*perfect* cosmological principle.’

3.3 Kinematic Relativity—an alternative cosmology

Milne's philosophy of cosmology came with a closely associated cosmological model, *kinematic relativity*, so-called because of its tight links to the kinematics of Einstein's Special Theory of Relativity. Kinematics, in Einstein's Special Theory, is especially concerned with observers trying to make measurements of the behavior of objects moving in systems relative to themselves. According to Milne's understanding, these measurements could only be made by the observers signalling among themselves using light or other electromagnetic radiation, using clocks to time the signals. In the end, all measurement—even space and velocity—reduced to timing the signals as they went from one observer to another. This idea of measurement represented a revolutionary simplification of previous ideas, and held philosophical interest for that reason alone. There were practical consequences as well. As Bondi later remarked, “Milne's idea led straightaway to the radar speed gun!”

Milne's kinematic relativity and its underlying philosophy both immediately brought careful scrutiny, not to mention controversy.

4. The Great Cosmological Debate Begins: 1933-1934

Eddington was the first to attack Milne's views. In a series of lectures given at Harvard during late '32 and published early in the new year as *The Expanding Universe*, Eddington denied the efficacy of both operationalism and hypothetico-deductivism, and not only defended explanatory realism, but strengthened his ontological position heroically: the theoretical entities of relativistic cosmology were not just plausible, they were so necessary to understanding the universe, that cosmological knowledge was essentially impossible without them. (Eddington 1932, p. 19)

4.1 Dingle's First Attacks

Few others would ever go so far as Eddington's ontological heroism; yet epistemological and methodological heroism in the fight against Milne was not rare. Chief hero in this aspect of the attack on Milne was Herbert Dingle, a highly respected astrophysicist, and then-secretary of the Royal Astronomical Society. Dingle's initial foray appeared as a response to Milne's first detailed presentation of kinematic relativity. (Milne 1933) After claiming that while kinematic relativity did not differ appreciably from relativistic cosmology in its mathematical formalism or observable consequences, Dingle asserted that, on the other hand, it invited special criticism because it renounced “the fundamental principles of scientific method,” namely, “Newton's principle of induction from phenomena.”(Dingle 1933 p178) Dingle was never to relent in his attacks upon Milne's hypothetico-deductivism, at all times rejecting the methodology as even a possible candidate for acceptance by genuine science.

Dingle's article appeared back-to-back with an appraisal of kinematic relativity by the important American cosmologist H. P. Robertson. (Robertson 1933a) Robertson focussed upon Milne's hypothetico-deducivism as well, noting that the cosmological principle in kinematic relativity functions as an *a priori* rule, rather than as an empirical generalization, its status in relativistic cosmology. Robertson otherwise is not especially taken with Milne's theory, limiting himself to remarks suggesting that, where they can be compared, kinematic relativity and relativistic cosmology apparently are similar in physical content. As we shall shortly see, Robertson's later work strongly belied this earlier apparent indifference to Milne's theory.

4.2 Two Ways to Disagree with Milne

Right from the start, cosmologists differed in their opinions about both the physical content of Milne's theory, and its underlying philosophy. Dingle disliked Milne's methods, but found the theory itself of not much interest. Robertson initially agreed with Dingle, but within a short time had significant changes of heart. Eddington disliked both the theory and its philosophy, finding them far too deviant from what was typical, i.e., relativistic cosmology and its mainstream philosophy. Younger cosmologists such as McVittie and McCrea, students, respectively, of Eddington and Whittaker, soon joined the fray. McVittie initially found the physics of kinematic relativity quite interesting, and quite different from the physics of relativistic cosmology. (McVittie 1933b) But Milne's philosophy was something else; the strict empiricism McVittie had earlier revealed (McVittie 1933a) made him equally unhappy with both Milne's rationalism and his hypothetico-deductivism.

McCrea's remarks were among the most perceptive and favorable. (Kermack and McCrea 1933) While he thought that Milne's operationalist criticisms of curved and expanding space were of little import, McCrea was the first to notice the parsimony and elegance of Milne's strictly kinematic solution to the problem of the origin of the universe's expansion. Since a search for such a solution had vexed relativistic cosmology for several years (McVittie 1931), McCrea suggested that Milne's mechanism should be immdiately shown to be part of relativistic cosmology. (Kermack and McCrea 1933 p. 529)

Clearly, the so-recently won consensus about relativistic cosmology and its philosophy had dissolved into confusion and controversy over Milne and his methods.

4.3 Milne Makes Philosophical Improvements

Over the next year or so, Milne made strenuous efforts to elucidate both kinematic relativity's physics and its philosophy, beginning, as would be his wont, with the philosophy. In October, Milne addressed the Philosophical Association, giving an explicit and detailed analysis not only of his philosophical views, but also of their history, which, he claimed, extended back to Locke and Hume (Milne 1934a) His description of the two opposed methods—inductive empiricism vs. hypothetico-deductivism—is quite clear and useful:

> Strictly speaking, physics has no philosophy. It has method…Now the methods of theoretical physics seem to be reducible to two species, the method of starting with concepts and the method of starting with things observed. …When a subject is developed from concepts the concepts play the part of the terms occurring in the axioms of geometry…. The concepts are undefined save as being governed by propositions of which they are subjects.

Milne's commitment to axiomatization is notable here. It was based in his earlier admiration for the work of Whitehead and Russell (Crowther 1970); commitment to axiomatization in cosmology, once having been initiated by Milne, would be an enduring hallmark of the work of many, including both Robertson and Walker.

Three weeks after this address, Milne spoke on related topics at the monthly meeting of the Royal Astronomical Society. His main point was that theories differed only insofar as their concepts could be cashed out in observations deduced from them. Eddington took strong exception to Milne's arguments, claiming in response that kinematic relativity and relativistic cosmology differed more importantly in their ontology than in their consequences. Eddington was especially concerned with differences in the spacetime-geometry each theory ascribed to the world. For Eddington and his colleagues, the equivalence of gravitation and spacetime geometry was a genuine reality, a feature of the physical world, just as real as suns and moons and stars.

4.4 A Major Philosophical Issue: What makes a scientific theory

‘good’?

Milne was having none of it. In the next month's *Observatory*—the informal monthly publication of the Royal Astronomical Society—he took Eddington and his theoretical-realist colleagues to task, concluding that “theories differ simply and solely when their predictions as to phenomena differ”; most importantly, “this method of comparison avoids all reference to distance-assignments, world-geometry, schemes of projection or the like.” (Milne 1934b) In other words, metaphysics was to be avoided in cosmology; space, spacetime, geometry and the like were to be rejected as scientific realities, replaced by reference simply and solely to observations. The only realities, according to Milne, were what could be reported among observers about light signals and clocks.

During 1934 Milne worked together with his new student A.G. Walker. Walker never evinced much interest in the philosophical aspects of kinematic relativity, choosing instead to focus tightly upon working out the physical details of the theory itself. He had immediate success. (Walker 1934) One of his important conclusions was that other authors, specifically McVittie and Robertson, were wrong to conclude that the physics of Milne's theory ultimately corresponded to relativistic cosmology: “*Milne's system is fundamentally different from that of general relativity*.” (Walker 1934 p. 489; emphasis in original)

4.5 How to Choose Among Theories and Philosophies?

In an important review of the entire confused situation between kinematic relativity and relativistic cosmology, McVittie confessed that “experimentally it seems hopeless to discriminate between them…at present the choice is almost entirely a matter of personal taste.” (McVittie 1934 p. 29) At almost the same time, de Sitter took on Milne in serious fashion. (deSitter 1934) Responding to Milne's methodological challenge, he showed that, indeed, it is possible to formulate relativistic cosmology in axiomatic fashion, just as Milne had formulated kinematic relativity “from concepts.” But de Sitter explicitly rejected Milne's philosophical use of the cosmological principle, “which asserts that statistically the world pictures of two different observers must be the same.” His objection is founded on the matter-of-fact that “we have, however, no means of communicating with other observers, situated on faraway stars, or moving with excessive velocities.” (deSitter 1934 p. 598) So much for rational principles as hypotheses!

The year in cosmology ended almost as confused as it had begun, with one exception: Milne had gotten much clearer about his philosophical views, and was applying them to an exhaustive presentation of his cosmology, theory and philosophy. His book *Relativity, Gravitation and World Structure* (Milne 1935) would be published in just a few months.

5. The Triumph of Milne's Methods 1935-36.

The new year marked a sudden change. In short order, McCrea, Walker and Robertson succumbed to Milne's methodological recommendations: first, to carry out an operationalist paring of non-observational

concepts, then, secondly, to embed the resulting minimalist concept set in an axiomatic hypothetical-deductive structure. Thus was the famous Robertson-Walker spacetime metric born.

5.1 McCrea, Walker and Robertson Adopt Milne's Methods

McCrea's effort operationalized the concept of “distance”, principally and originally by comparison of certain elements of Newtonian cosmology and de Sitter's axiomatized version of relativistic cosmology. (McCrea 1935) Walker's paper specifically eschewed use of “any indefinable concepts”, in particular, he did not assume that the “associated metric [of relativistic cosmology] has any *a priori* physical significance.” (Walker 1935) Robertson's article, the first of three, is the most important, both in its content, and in the signal it sends, namely, that one of the original mainstream relativistic cosmology proponents has adopted a major element of Milne's new philosophy for cosmology. (Robertson 1935) Robertson's conclusion exhibits this point clearly and explicitly:

> We have examined, from the operational standpoint, the problem of determining the most general kinematical background suitable for an idealized universe in which the cosmological principle holds. Allowing the fundamental observers the use only of clocks and theodolites, and granting them the possibility of sending and receiving we have shown that for each given mode of motion *x(t)* there necessarily exists a quadratic line element which is invariant, in form as well as in fact, under transformation fqrom one fundamental observer to another. (Robertson 1935 p. 300)

Unlike de Sitter, Robertson accepts the cosmological principle, replete with its observers on far-separated particles. Moreover, as this statement shows, Robertson is intimately familiar with Milne's latest operationalist reduction: space is to be reduced to time measurements given by clock readings on signals exchanged between observers. Robertson gets this idea from Milne's book, which he had earlier reviewed (but which was only subsequently published) for *Astrophysical Journal*. (Robertson 1936)

5.2 But Eddington Scoffd…

Eddington disparages these same methods. In his scathing *Nature* review of Milne's book, he rejects Milne's hypothetico-deductivism, his cosmological principle, and, above all, his operationalism: “When I visit the Cavendish Laboratory, I do not find its occupants engaged in flashing light-signals at each other, but I find practically everyone employing rigid scales or their equivalent.” (Eddington 1935, p. 636) Whittaker's review was not so negative as Eddington's. (Whittaker 1935) While the senior physicist rejects Milne's operationalism and attacks upon the geometrical commitments of relativistic proponents, he is considerably more forgiving about Milne's hypothetico-deductivism, and even goes so far as to remark Milne's “brilliant record in astrophysical discovery.” Nonetheless, Milne's break with a tradition including at least “Einstein, de Sitter, Friedmann, LeMaître, Weyl, Eddington, H.P. Robertson and others” is to be regretted. (Whittaker 1935 p. 179) Perhaps, along with Eddington, Whittaker hopes that soon “Professor Milne will return to orthodoxy.” (Eddington 1935, p. 636)

But Whittaker's view on Milne must be put into the perspective he held on the whole ongoing debate. As he saw it

> …a lively debate is in progress at the present moment between Sir Arthur Eddington and Dr Harold Jeffreys of Cambridge, Professor Milne of Oxford, Sir James Jeans, and Professor Dingle of the Imperial College, the subject being the respective shares of reason and observation in the discovery of the laws of nature. (Whittaker 1941, p. 160)

But lively debate is far too gentlemanly a description for what now occurred. After holding his ire somewhat in check for—as he saw it—already far too long, Dingle finally erupted.

6. Dingle's Denoument

Controversy over Milne and his philosophy reached a crescendo in mid-1937. Dingle, his stew having finally boiled over, wrote privately to the editor of *Nature*, first castigating the rampant cosmological ‘mysticism’ passing itself off for science, and then offering to produce an article taking the sword to the mystics themselves. His offer was immediately accepted. The result was Dingle's notorious “Modern Aristotelianism”, a polemical diatribe chiefly against Milne, but aimed as well at Eddington and Dirac on account of their “betrayal” of the scientific method of Newton and his fellow members of the Royal Society. (Dingle 1937)

6.1 Modern Aristotles?

The article is remarkable both for its style and for its content. Dingle's style in the article is vituperative. Thus, emotionally-loaded terms such as “paralysis of reason,” “intoxication of the fancy,” “‘Universe’ mania”, and the like frequently appear, these to be topped only by references to “delusions,” “traitors,” and, of course, “treachery,” each associated with one or more of the guilty parties. (Dingle 1937, p. 786)

Above and beyond his extreme language, Dingle makes certain substantive claims bearing directly upon central philosophical questions. The issue, as he sees it, is nothing more than the question “Whether the *foundation* of science shall be observation or invention” (Dingle 1937, p. 786). As always, talk about ‘foundations’ is philosophical talk. The two opposing positions Dingle here calls “foundational” involve views on both method and epistemology, suitably tangled together. Dingle delineates the opposed alternatives as follows. The way of true science, he claims, shows that “the first step in the study of Nature should be sense observation, no general principles being admitted which are not derived by induction therefrom.” (Dingle 1937, p. 784) Stated more explicitly, Dingle here argues that authentic science is **empiricist** in epistemology (scientific knowledge is founded in sensory observation), and **inductivist** in method (general principles are reached via inductive logic). Opposed to this view, he argues, is “the doctrine that Nature is the visible working-out of general principles known to the human mind apart from sense perception.” (Dingle 1937, p.787) As representative of this latter view Dingle cites Milne, and refers in particular to Milne's claim that “it is, in fact, possible to derive the laws of dynamics

rationally…without recourse to experience." (Milne 1937, p. 329) Obviously, Dingle is here arguing against the view, Milne's view, that authentic science may be **rationalist** in epistemology (scientific knowledge is founded in pure theoretical reasoning apart from sense perception), and **hypothetico-deductive** in method (general principles are justified by their deductively implying correct observations).

Along with Milne, Dingle indicts Eddington, and, by implication, Dirac, all three of whom, Dingle believes, are guilty of inventing scientific hypotheses by free mental imaginings rather than by strict immersion in observations and observational data.

6.2 Dingle as 'True Believer'

What is going on here? Put bluntly, Dingle is an old-fashioned empiricist and inductivist. He believes that the only way to do true science is to first collect data, then, and only then, to hypothesize on the basis of that data. Observation, then hypothesis. As he sees it, Eddington, Milne and Dirac have got it exactly backwards. They first (as he terms it) assume an hypothesis, then, and only then, go about collecting data. Except, according to his lights, the data isn't ever collected: "to [the Aristotelians'] modern representatives it seems as though a fancy is no sooner in the head than it is on paper and sent for publication." (Dingle 1937, p. 785) Obviously Dingle is simply wrong; it never occurred to his opponents that hypotheses would **not** be followed immediately by attempts at deductive prediction of observational consequences. But it was enough, in Dingle's mind, that they didn't use induction, for them to come under blame.

6.3 Wrong from the Very Start

But there is something else at work here as well. Dingle doesn't object solely to his opponents' lack of inductive logic. Of equal importance is the fact that they find the source of their hypotheses in fairly general principles, wide-ranging rational proposals about the structure of the universe at large. These principles Dingle takes to be *a priori*, in the most pejorative sense of that term. They are phantasms, "chimeras" he calls them, which seduce the imaginations of his opponents, and lead them and their dumb-struck admirers away from the genuine, authentic method of science. **This** is what really sticks in Dingle's craw. In turn, Eddington, Milne and Dirac are chastised, each for something slightly different, but at bottom the same, namely, they one and all "appear as a victim of the great 'Universe' mania." (Dingle 1937, p. 786) In the end, Dingle believes, the danger of this new 'methodology' is real, and serious. As he notes in conclusion:

> Nor are we dealing with a mere skin disease which time itself will heal. Such ailments are familiar enough; every age has its delusions and every cause its traitors. But the danger here is radical. Our leaders themselves are bemused, so that treachery can pass unnoticed and even think itself fidelity. It is the noblest minds that are o'erthrown…the very council of the elect can violate its charter and think it is doing science service. (Dingle 1937, p. 786)

Here Dingle obviously goes over the top. Yet overblown as it is, there is no doubting his sincerity: Milne

and the other cosmologists have betrayed the true science bequeathed them by their ancestors in the Royal Society.

How could Dingle be answered?

6.4 The Debate Goes Very Public

The response arrived three months later, on 12 June. On this particular Saturday in June, *Nature* published a fifteen-page special supplement as No. 3528. Contained within were contributions from sixteen “representative investigators”, as the editor referred to them, each responding to “Modern Aristotelianism” *Nature*'s Editor, R.A. Gregory, introduces the occasion by noting that “in *Nature* of May 8, we published an article by Dr. Herbert Dingle entitled ‘Modern Aristotelianism’”. Because the article, as Gregory goes on to say, “created considerable interest”, *Nature* “decided to invite further contributions on the subject from a number of representative investigators.”

“Created considerable interest” is, to understate the issue, an understatement. Some of the contributors were quite obviously livid with rage and other volatile emotions. Others, such as Milne himself, who had come in for particularly scathing criticism in Dingle's article, were patient and careful in rebuttal. Each of the sixteen contributors to the special article chose a side in the controversy, either pro Dingle's inductive empiricism, and con Milne et al.'s rationalist hypothetico-deductivism, or vice versa. Remarks made by the participants exhibit the full diversity of philosophy of science in their contemporary community. Dingle's views, in particular, were not without favor.

Harold Jeffreys, F.R.S., noted geologist and astronomer, and author of a well-regarded philosophy of science book *Scientific Inference* (1957), led off with a nice ad hominem: “Without using induction, Milne and Eddington could not order their lives for a day, and what they are really asserting is that they are entitled to use special axioms in physics, for which no need has been shown.” Jeffreys' criticism here of course ignores the role of deductive observations in justifying the “special” axioms. The problem, as Jeffreys sees it, originates in the perpetrators' “belief that there is some special virtue in mathematics.” L.N.G. Filon, F.R.S., vice-chancellor of the University of London agrees on this point, noting that “some men of science appear to think that they can solve the whole problem of Nature by some all-inclusive mathematical intuition.” R.A. Sampson, the Astronomer Royal, focusses upon the rationalistic aspects of the ‘modern Aristotelians’, to wit, for their “framing a theory independent of experience, such as is denounced in Dr. Dingle's article”, which produces work not unlike that “of a poet or other humanist, who gives us at most a number of illustrative cases.”

6.5 The Counterattack

But Milne, Eddington, and Dirac had their supporters as well. N.R. Campbell, whose theory of science was already well-known, makes an uncontroversial interpretation of the affair. “Science” he begins, “(or at least physics) has long consisted of two distinct but complementary activities”, one of which is experimental and empirical; “its procedure is induction.” The other activity attempts to provide

explanations of scientific laws, which explanations have the “pecularity” that “they often (not always) predict new laws in addition to explaining old ones.” Campbell cannot resist ending on an ad hominem of his own: “If he [Dingle] does not deem it important to observe the distinction between what is and what is not demonstrable experiment, surely he should welcome a movement to amalgamate the Royal with the Aristotelian Society.” Indeed.

G.J. Whitrow, then a young lecturer at Christ Church, Oxford, returns to the mathematical theme. Dingle, he argues, “not only attacks the particular methods adopted by contemporary mathematical investigators in relativistic cosmology, but even refuses to admit that this subject is worthy of scientific investigation as it is based not only on experience but also on reason.” Hypotheses, by this light, may originate rationalistically as well as any other way, certainly there is no problem with this.

6.6 The Coolest Voice

The clearest, most temperate discription of the issues at hand is given by young cosmologist William McCrea, then professor of mathematics at Queen's, Belfast, and editor of the R.A.S.'s *Observatory*. Not to be outdone by Jeffreys, McCrea begins with an ad hominem of his own: “Dr. H. Dingle's objection to ‘modern Aristotelianism’ seems to be itself what he would call Aristotelian rather than Galilean.” In other words, Dingle raises a non-empirical objection about Milne et al.'s non-empiricism! But McCrea soon gets to the heart of the matter, the role of hypothetico-deductivism in mathematical physics:
